EMINENT AMERICAN PHYSICIANS AND SURGEONS

ILLUSTRATED WITH FINE PHOTO-ENGRAVED PORTRAITS.

EDITED BY

R. FRENCH STONE, M. D.,

AUTHOR OF "ELEMENTS OF MODERN MEDICINE;" SURGEON-GENERAL NATIONAL GUARD STATE OF INDIANA;
CONSULTING PHYSICIAN TO THE INDIANAPOLIS CITY HOSPITAL AND DISPENSARY; EX-PRESIDENT OF
THE MARION COUNTY MEDICAL SOCIETY; MEMBER OF THE INDIANA STATE MEDICAL SOCIETY
AND AMERICAN MEDICAL ASSOCIATION; FORMERLY MEDICAL CADET AND A. A. SURGEON
U. S. ARMY; PHYSICIAN TO THE INDIANA INSTITUTE FOR THE BLIND; VISITING
PHYSICIAN TO THE MARION COUNTY ASYLUM; EXAMINING SURGEON FOR
U. S. PENSION BUREAU, AND PROFESSOR OF MATERIA MEDICA,
THERAPEUTICS AND CLINICAL MEDICINE IN THE CENTRAL
COLLEGE OF PHYSICIANS AND SURGEONS, INDIANAPOLIS.

ENTERED ACCORDING TO ACT OF CONGRESS IN THE YEAR 1892

By R. FRENCH STONE,

IN THE OFFICE OF THE LIBRARIAN OF CONGRESS, WASHINGTON, D. C.

PREFACE.

THE urgent demand for a new American Medical Biography, and the assurance of hearty co-operation of the medical profession, fully confirm the editor and publishers in the belief that the publication of such a work will be duly appreciated. Every reader has recognized the benefit of the many local and general biographies descriptive of noted men of diversified professions; but each learned profession should, if possible, have a distinct biographical cyclopedia of its own representatives, and one that is complete and fully up to date.

To those familiar with the history of American medical literature, it is needless to say how lamentably deficient it is in the above respect. Although there is no lack of memoirs, yet they are, for the most part, either included in voluminous cyclopedias, or scattered through local and ephemeral publications, practically inaccessible to the great majority of readers, which renders them almost a nullity as respects the object for which they were written. It is believed that the first attempt in this country to systematize our knowledge upon the subject was made by Dr. James Thacher, an eminent physician of Massachusetts, in a work replete with interest and instruction, entitled "American Medical Biography," issued at Boston in 1828. It was published sixteen years before the author's death, but never reached a second edition, although highly deserving such a compliment. Dr. Thacher was a distinguished Surgeon in the War of the Revolution. His work essentially consisted of a collection of life sketches of the more illustrious medical men who had flourished during that period, and up to the date of its publication, contributed mainly by writers familiar with their personal career. In 1845 appeared a second work, bearing the title of "American Medical Biography," edited by the late Dr. Stephen W. Williams, also of Massachusetts, and was intended as a continuation of the work of Dr. Thacher, and like it composed of distinguished medical men, whose careers had extended from 1828 to the date of its appearance. Dr. Williams died several years ago in the State of Illinois, where he had gone to employ the evening of his days in the practice of his profession, cherishing to the last a noble and disinterested attachment for the science of medicine. In 1861 a third publication, also bearing the same title as the two preceding works, appeared under the editorial management of the late Dr. Samuel D. Gross. This publication, consisting of extended memoirs of about thirty of the most eminent Physicians and Surgeons of America, whose field of labor had extended from near the beginning to about the middle of the present century. The three works above mentioned consisted of memoirs of deceased members of the medical profession. In 1878 a fourth publication of medical biography was edited by Dr. William B. Atkinson, of Philadelphia, under the title of "Physicians and Surgeons of the United States." The latter work was intended to include sketches of only the living representative medical men of the time. As there was no good reason why the true merit of any member of the profession should remain unknown to the world until read in his obituary, and as there was a desire to learn something of the life history of the real workers in the field of medicine and their professional achievements, this publication also met with a very popular appreciation. So far as our information extends the foregoing are the only works exclusively on medical biography of national scope. They were all prepared by distinguished authors who seemed deeply impressed with the conviction that such a labor was necessary in order to rescue the memoirs of some of their predecessors, as well as contemporaries, from undeserved oblivion, and so well did they execute their task that their efforts were regarded as monuments of their industry, zeal, and judgment as well as a legacy to those who follow them, worthy alike of our admiration and our gratitude. To commemorate those who have adorned the profession of medicine, is not only a just tribute to such as have earned the meed of praise, but is at the same time a debt that posterity may claim, in order that it may emulate their character and participate in the honors of those revered; and as the lapse of time obliterates the record, it becomes a task of affectionate interest, and of professional duty to cut afresh the traces of the worn inscriptions, and thus to renew their influence on the present and succeeding generations of our country.

While acknowledging in the text his obligation to various sources for the materials of this publication, the editor desires to mention his special indebtedness to the authorities above mentioned, all of which have been carefully consulted and freely utilized to meet the purposes for which this compilation has been designed. As the preceding works are now out

of print, and not likely to be republished, and as they have successively appeared during the present century as if in response to a professional demand at intervals of about every fifteen or twenty years, it is evident that there is now ample room for other volumes of similar character. The preceding works, though excellent in their day, are no longer available or sufficiently comprehensive in their scope to meet the demands of the present time. Since their publication, many years ago, almost a new generation of physicians and surgeons has come to the front, and by their efforts perhaps more real progress has been made in the science and practice of medicine than at any other period since the dawn of its history.

The present publication, therefore, owes its origin to a desire upon the part of the editor to present a book differing in scope, plan and arrangement from all others hitherto published, by including an account of the many illustrious medical men who have honored our profession from the early colonial days to the present time, and to place their services and claims for remembrance more conspicuously than has yet been done before the American people. His object is to not only show what has been accomplished by our illustrious predecessors in the medical profession in the early history of this country as well as by the labors of those notable pioneers still in the field of action, but to especially present the achievements of our more recently distinguished medical men who have given American medicine and surgery a rank as high at least as the science and practice have attained in the older countries of Europe. With the features indicated, it is believed that such a work will prove of general interest and permanent historical value, alike complimentary to our profession and the country in which we live. In every age and among all nations by which medical science has been cultivated, the names of those who have devoted themselves to its advancement or to the application of its principles to practical purposes have been inscribed upon the brightest page of history, whose ample face bears record of the grateful homage paid to worth. If neither in the forum, the pulpit or the tented field can the physician be heard or admired by many, yet there are other domains in which his service and his merit are no less revered. It has been truly said that the ordinary life of the physician is essentially a history of private benevolence, abounding in charitable acts and deeds of Samaritan kindness, rather than of public renown. As a rule, it is devoid of stirring adventure by field and flood, and its current, though deep and strong, is too quiet to fully awaken the interest of the masses. With the latter, the story of some great military chieftain, whose victorious achievements consist in the destruction of his fellow-man, is ever more attractive. But if the achievements of the warrior or the statesman are lauded amid the bustle and agitation of civil strife, the glory of the physician is reflected in the quiet exercise of that deeper and more important mission which has for its object the welfare of human interests in the tranquil course of domestic life, where the affections dwell and the heart finds its repose in sympathy with affliction and bereavement, in relief of physical pain and the cure of disease in all its protean forms. It is here that the physician occupies a place which is second to no other on earth in its sacred importance and beneficence. Living in and for his art and its scientific development, his constant endeavor is to ameliorate the condition of the human race. His scene of labor is in the daily rounds of private practice in the chamber of the sick and in the wards of the hospital. It is here that he displays his strength and asserts his claims as man's benefactor. The life of the skillful physician, viewed in the light of his intellectual exertion, his realm of authorship, his original research, his investigations of the nature, causes, treatment and prevention of disease, or in his constant efforts in seeking, finding and imparting with unwearied industry new and useful knowledge for the alleviation of human suffering, the prolongation of life and the improvement of public health, will be found to present a panorama of varied and never-ceasing activity, voluminous and replete with scientific and philanthropic interest. The faithful rendering of such a biography becomes at once a precept and an example, an argument and incentive, awakening in the minds of others who may read and reflect upon its teachings the determination to press steadily forward in a like honorable career. To those who have grown weary with life-long toil in the vineyard of their profession, such biographies afford an interest and encouragement, a vindication and a satisfaction in the choice of their noble avocation, and to all they present chapters of profound importance in the history of society.

If the achievements of medical men reflect brilliancy in the ordinary and uneventful pursuit of peaceful life, the annals of history will show that they shine with no less luster amidst stirring scenes of danger and of public calamity. In the facing of malignant epidemics, or in the pursuit of scientific research, in braving the exposures incident to exploring expeditions of unknown regions, or in response to the call for relief of the agonies and the horrors of cruel and grim-visaged war, whether on the perilous, tempestuous sea

or in the fiery ordeal of battle, the profession of medicine instead of a hindrance has been the incentive and opportunity for the exercise of a courage and daring unsurpassed by that of any other avocation of man. If it be said by the thoughtless that the military surgeon is a non-combatant, and therefore not exposed to the dangers and chances of war, statistics will answer that in almost every conflict in the history of our nation the proportion of deaths of officers of the line who were killed in battle, who have died in camp, in hospital, in prison, or from disease incident to active service, has been exceeded by the mortality among medical officers. In the present work, therefore, it becomes a duty and a pleasure to record the professional achievements of those early and modern military and naval surgeons whose history is identified with that of our country, from the war for independence to that which was waged for and against the perpetuity of the Union, and especially of those who nobly took part on either side in our recent conflict, who followed through the thickest of its dangers, not to deal out destruction, but to stanch the wounds of friend and foe alike, and who were the first to extend the fraternal hand across the field of strife when it had ceased between the opposing armies.

A common and well-grounded objection urged respecting the various biographical works and local histories relating to towns, cities, counties and States, purporting to present the leaders of our profession, is an utter lack of discrimination, or the inclusion of the members of all schools of medicine, without regard to real merit. But as this work is to be issued in the interest of Regular Medicine, and as its editor believes the teachings of this school embodies everything essential to medical skill and progress, we trust that its pages will be found free from such objections. In its publication the editor does not claim that it embraces biographical notice of all the eminent men of this great country; he does, however, believe that he has presented, if not a majority, at least a greater number of those entitled to such distinction, representing the different periods of American history, than has hitherto been published in any other work in this line of medical literature. Doubtless there are yet many illustrious members of our profession who are equally worthy of biographical mention, but if any such have been omitted, or if the life sketches of any who are included are brief or incomplete, it has been neither the fault of the editor nor the publisher, as neither time, labor or expense has been spared to render the work as complete in all its details as possible. Our great aim has been to include within this volume biographical sketches that shall present with sufficient fullness the latest results of original and historical research, and to arrange them in alphabetical order, thus rendering it a reference book of the most valuable character. As all articles relating to the "great beacon lights" of the profession have been made as complete and exhaustive as the limited space of a cyclopedia could afford, it is believed the work will not only prove entertaining, but instructive, or educational, as well. The field from which the editor has gleaned is a wide one, in fact *national* in its range, and its biographical list includes prominent officials connected with the following organizations: American Medical Association, American Academy of Medicine, American Association of Genito-Urinary Surgeons, American Association of Obstetricians and Gynecologists, American Climatological Association, American Dermatological Association, American Gynecological Society, American Laryngological Association, American Medical Editors' Association, American Neurological Association, American Ophthalmological Society, American Orthopedic Association, American Otological Society, American Pediatric Society, American Physiological Society, American Public Health Association, American Rhinological Association, American Surgical Association, Association of American Medical Colleges, American Volunteer Medical Corps, Association of American Physicians, Association of Medical Superintendents of American Institutions for the Insane, International Medical Congress, National Association of Railway Surgeons, National Board of Health, National Conference of State Boards of Health, New England Psychological Society, Rocky Mountain Medical Association, Sanitary Council of the Mississippi Valley, Southern Surgical and Gynecological Association and Association of Military Surgeons of the National Guard of the United States. Also, prominent officers of the United States Army, United States Navy, United States Marine Hospital Service, United States Pension Bureau, Professors in regular Medical Colleges, Hospital Physicians and Surgeons, Editors of leading Medical Journals, distinguished Medical Officials in charge of City and State Benevolent Institutions, as well as those connected with County and State Medical Societies. Authors who have made important contributions to the literature of the profession, and those who by long experience or professional success have become of eminence have likewise been fully recognized. In short, this publication includes biographies of many noteworthy physicians, surgeons, and specialists in every important town and city in the United States and Territories. It is not supposed that great medical

men are only found in great cities, and only inferior ones in inferior towns, for sometimes the most capable men of the profession are recruited by the former from the latter places. And while it is foreign to the nature of this work to attempt the resurrection of "Village Hampdens, or mute, inglorious Miltons," yet whenever our researches have led to the discovery in the most obscure and unexpected localities, the names of men,

"On fame's eternal scroll worthy to be inscribed,"

a liberal recognition of their worth has not been omitted.

The book begins with an introductory chapter containing an outline review of the progress and condition of medical science and medical practice from an early period in our country's history to the present time, and is supplemented by a complete "Local Medical and Surgical Index" or alphabetical arrangement under cities and states of the names and business address of eminent physicians, surgeons and specialists, as well as the page upon which their biographies are to be found. This directory is designed to aid those who seek professional services at particular places, and is a feature especially desired by correspondents in every section of the country. The work will be found profusely illustrated by numerous fine photo-engraved portraits, accompanied by fac-simile autographs, thus securing for the publication a most valuable and attractive national portrait gallery of the distinguished medical men of the country.

It was found that the extra thickness of paper requisite for printing portraits would make the book too large for convenient handling if printed in ordinary style, with paragraphs and leaded lines, but by avoiding this the publishers have been enabled to print with the present number of pages the same amount of matter that would otherwise occupy a volume even much larger than the one first intended. The editor deems it due to himself to state that the idea which first led to the publication of this work was conceived several years ago, since which time he has gradually gathered material essential for its completion. In 1891 he issued circulars in which, setting forth the objects of the work, he endeavored to enlist the interest and co-operation of prominent members of the profession in various parts of the United States in furtherance of his design. The project met with general favor, and it was not long before he received sufficient pledges of aid to warrant the expectation of its earlier completion. Some of the pledges were promptly redeemed, others delayed, and some still remain unfulfilled. According to the systematic arrangement of the work each sketch required printing in alphabetical order. Any delay, therefore in sending in the data of sketches caused great hindrance to the progress of the publication. When at length, in the spring of 1893, a sufficiency of material was gathered to form a large volume, the financial panic suddenly occurred, prostrating all branches of business, and this also for a time operated against its more rapid completion. This statement it is considered necessary to make in order to show that the unlooked-for delay in the appearance of the work was not occasioned by any fault, neglect or mismanagement of the editor, who never for a moment despaired of the enterprise, and who has been unceasing in his efforts to urge it on to final completion. His duty has been to exercise great care in the selection and preparation of the sketches, to superintend the publication in a general manner, and to expunge from its pages that which was lacking in professional interest, or whatever was likely to prove offensive to good taste or to be at variance with the amenities of medical ethics.

In facilitating a large professional correspondence, in verifying the data of sketches, and in securing other important information requisite for the preparation of the work, great pleasure is taken in acknowledging the obligation the editor is under to the publishers of the "Medical and Surgical Register of the United States," "Appleton's Cyclopaedia of American Biography," "Carson's History of the University of Pennsylvania," the *Journal of the American Medical Association*, the *Magazine of Western History* and other valuable periodicals of the day. The facts relating to the personal history of the living distinguished representatives of the profession included in this work have been contributed by friends, colleagues and those most familiar with the career of the subjects. Many biographical sketches of pioneers in medicine are from the pen of Dr. N. S. Davis, of Chicago, Dr. Chas. E. Cadwalader, of Philadelphia, Dr. Joseph Jones, of New Orleans, and other notable American physicians. Some of these memoirs were in original manuscript never before published, and some were extremely rare and of great historic value, and for all of which we desire to express assurance of our most sincere thanks and especial appreciation.

Editor and Compiler.

INTRODUCTORY.

GENERAL REVIEW OF THE PROGRESS AND PRESENT CONDITION OF MEDICAL SCIENCE AND OF MEDICAL PRACTICE IN THE UNITED STATES OF AMERICA.

It is known that in the colonial history of our country the first practitioners of the healing art were educated in their parent country, and following the fortunes of their less gifted countrymen, became participants of their struggles and trials. "Such were the few medical men who first landed on our shores and who encountered all the difficulties of administering to the ailments incident to a new climate, aggravated by deficient facilities of protection from the elements and exposure. They were in many instances possessed of a thorough education and of classical accomplishments, and nobly sustained their part in the untried scenes through which they passed. In some cases the theological and medical professions were united in the same individual, medicine being studied as an accessory science with the especial view (as is now frequently done by our missionaries to foreign lands), to meet the exigencies of administering, if required, not only in spiritual concerns, but in bodily derangements." This union of the clerical and medical professions has been explained by Dr. Thacher as follows: "The inducement to emigrate, with a large proportion of the colonists, was of a religious nature. They were restive and unhappy under the restrictions and even persecutions which emanated from the bigotry of the church establishment of England. The Puritan clergy of England were, for more than twenty years prior to the emigration of the first settlers, subjected to the sharpest persecution. Hence, as a precautionary measure in case of an ejection, a considerable number of clergymen of that period were educated to the medical profession, and not a few were eminent practitioners before they crossed the Atlantic. When these professional men came to form connections in the Colonies, it was found that the small congregations were unable to afford them a comfortable support, hence the necessity and convenience of their resorting to secular avocations." In a historical address delivered at the opening of the Medical Department of Columbia College, Washington City, District of Columbia, March 30, 1825, Prof. Thomas Sewell, in this connection, says: "So far were the professions of divinity and medicine united that the clergy not only prescribed for the sick, but entered into controversies and wrote practical works on the diseases of this country." The two avocations, however, occasionally interfered with each other, as is illustrated by the following incident related by Dr. Joseph Carson: A theological physician of the early colonists was upon a certain occasion in the midst of his usual Sunday services when a message was conveyed to him that a negro girl was dangerously ill and needed his medical attention. Having no other means in the pulpit of giving his directions, he seized a hymn-book and wrote upon the fly-leaf, "Let the wench be blooded, and wait until I come." It must not be supposed that from the very commencement of the settlements all were supplied with the highest degree of skill or consummate learning. The colonists in the infancy of their establishments were often apparently satisfied with a moderate amount of professional competency.

Referring to the progress of medical education in North America, Professor William Pepper, of Philadelphia, in his recent address before the Pan-American Medical Congress, says: "The scattered handfuls of early settlers on our shores had, indeed, problems facing them more urgent than the promotion of science. They differed as widely in their motives for undertaking the appalling task of conquering and colonizing America, and in their fitness for the work, as they did in their nationalities. Separated widely from the mother countries, hampered very often by unwise and vexatious interference from the home governments, they waged war against the powerful tribes of aborigines who swarmed over

the country, and against the no less serious obstacles of untried climatic and political conditions. Bloody warfare raged promiscuously and disease was rife." During the colonial period of our history it was the custom for young men, who entered upon the study of medicine, to become regularly apprenticed to some practitioner for a term of three or four years, during which time the preceptor was entitled to the student's services in preparing and dispensing medicine, and serving as an assistant in minor surgical operations. As a return for this the physician was obliged to give the student detailed and thorough instruction in all the branches of medicine. Many of the leading men frequently had several students in their office, constituting a small class, who were drilled as regularly in their studies as they would be in college. In some instances the term of apprenticeship was extended even to six or seven years. When the medical school sprang into existence it was first intended merely to supplement the apprentice system, and as a means of communication of one part of the country with another were exceedingly limited, it was found desirable to concentrate school work into as small a part of the year as possible. Hence the origin of the short term of four months, which has clung so persistently to the American system of medical college education. The medical schools started in Philadelphia and New York were the only ones attempted before the Revolution. In June, 1768, the first commencement of the College of Philadelphia was held, at which the degree of Bachelor of Medicine was conferred upon ten students, John Archer being the first to receive this honor, and at the commencement of the same institution in 1771, the degree of Doctor of Medicine was conferred upon four students. The degree of Bachelor of Medicine was first conferred by Kings College, New York, in 1769, and the degree of Doctor of Medicine by that institution in 1770. From the statement of Dr. Sewell, an authority previously quoted, it appears that the claim of priority in conferring degrees in medicine must be awarded to the Philadelphia School, while the precedence in conferring the Doctorate must be given to New York. The struggle for American Independence interrupted the work of both these institutions. Dr. J. C. Warren, of Boston, in a recent address on "Medical Education," says: The close of the last century found schools established not only in Pennsylvania and New York, but in Massachusetts, Maryland and Vermont. There were, however, in 1810, only five medical schools in existence, with an aggregate number of students of about 650, of whom 100 received the degree either of Bachelor or Doctor of Medicine. The Bachelor's degree was given to those who had attended one full course of college instruction. It was hoped that such students, after a short period of practice, would eventually return to take the higher degree; but as this expectation was not fulfilled, the degree of Bachelor of Medicine was soon wisely abolished. A noticeable feature of the education of that early period in our medical history were the requirements for a high standard of general education. Those students who did not possess a college degree were expected to pass an examination in Latin, Mathematics, and "Natural and Experimental Philosophy." To obtain the degree of Doctor of Medicine it was necessary that the applicant should have been a Bachelor of Medicine for at least three years, should have attained the age of twenty-four years, and should write and defend a thesis publicly in the college.

Such was the standard of education with which the present century opened. New schools continued to be created, not infrequently in connection with some university, as in 1810 at Yale University, in 1817 in Lexington, Kentucky, in 1820 at Brunswick, Maine, in 1825 at Charlottesville, Virginia, until, in 1840, twenty-six new medical colleges had been added to the list, the whole number of students in the country amounting to 2,500, the population in that year being 17,069,453. A glance at the report of a committee to the Medical Society of the State of New York in 1833 gives a good idea of the amount of work done by the schools at that period. In the twenty schools mentioned in this report, the number of courses of lectures required was two, with one exception—that of the University of Virginia, where three courses were required; and to the credit of this university be it said, the length of each course was ten months, whereas, the almost invariable custom of the other schools was to give a course of four months' duration only. The time of study purported, however, to be in all cases three years, "including the time devoted to lectures," as it is stated in most of the reports. This straw indicates that at that time the chief dependence, or nearly so, was placed upon the extra-mural instruction which was given to the student. At Yale University there was this additional requirement, namely, that the student was required to study four years, "if he had not graduated," which phrase, probably, means, if he had not already taken the academic degree. This seems to be the first intimation that a longer term than the standard then set was necessary for a complete equipment for the practice of medicine.

"The Medical Institution of the State of Georgia (incorporated in 1828) gave at first the

bachelor's degree with one year of study, but immediately abandoned it for the usual curriculum. In the University of Pennsylvania, to which we look for the standard in these early as well as later days, two full courses were required, but as in many other schools one course only was demanded from those who had attended a course at some other reputable school. In addition, a course of clinical instruction in one of the Philadelphia hospitals was required. The course was then three years in length, but as each course of lectures lasted only four months, it was expected that during the remaining portion of the first two years the student should receive private instruction. As the period of the school term was so short, it is interesting to note at what time of the year the various courses of lectures began. This, it will be seen, varied greatly according to the geographical position of the institution. At Dartmouth and the University of Vermont the term began in August. In Bowdoin College, Maine, however, it began in the middle of July, continuing until the middle of May, that is, the term time in the far north was in the summer or spring. At Yale and Harvard, and in Philadelphia and New York, the term opened at the end of October or the beginning of November, as did also the schools in North Carolina and Kentucky. The University of Virginia, with its long course of ten months, began early in September. Although the term time was exceedingly short in some schools, a large amount of work was crowded into the daily routine of the students. Five or six systematic lectures a day, with attendance on clinics and dissections when possible, was considered nothing more than a fair amount of work for the medical student to digest properly."

This system of teaching remained practically unaltered in 1851, if we may judge from a report to the Committee on Medical Education of the American Medical Association. In regard to the private instruction which was supposed to continue during the remaining eight months of the year, the report states that a very large proportion of students simply read medicine under the direction of their preceptors. Anything like careful instruction upon the part of the teachers did not exist. The student, neither while attending lectures nor while in his preceptor's office, was encouraged in anything like faithful and rigid study. To remedy the defect, private schools for teaching medicine were founded by enterprising physicians and surgeons, and these quiz classes which were then inaugurated became a prominent feature of the national system of teaching. Many a distinguished professor has first won his spurs at these private schools, and many valuable experiments in medical education were carried on by these men. As the college term has lengthened, the necessity for these accessory courses has diminished, and in many cities the extra-mural instruction, whether by private school or by teacher, has passed into history. As we approach the middle of the century, we find the nation growing rapidly in population and prosperity, and a corresponding increase in the numbers and activity of the medical profession. From 1830 to 1845 the number of medical schools in the United States had more than doubled. At a meeting of the Medical Society of the State of New York in 1839, when the subject of medical education was brought forward, it was proposed to hold a national medical convention the following year in Philadelphia, consisting of representatives from the different schools and State societies. No response was made to the action of this society, but in 1844 Dr. N. S. Davis, then a delegate from Broome county, New York, offered a resolution that a national convention be called in 1846, and the American Medical Association thus sprang into existence, the fundamental idea, which brought about the formation of the association, being the improvement of our system of medical education. It was high time that some such movement should take place, as the rapid increase of the number of medical schools brought with it a constant increase in the laxity of methods of teaching.

The equipment of a new school was, continues Dr. Warren, sometimes pathetic in its meagerness—a manikin and a few lecture rooms constituting the entire "plant" of the infant institution. It would not do to question the dean too curiously about the clinical facilities which the school enjoyed; and as for laboratory work there were few teachers sufficiently advanced in their ideas to think of criticising the absence of such instruction. There was, indeed, no time for it. Every available space in the tabular view was filled with lecture hours. Professors were asked to come from neighboring towns to assist in teaching, and often gave two lectures in the same day. This cramming process, which seems so purely American in its hustling activity, is perpetuated to the present day in a limited number of schools, chiefly those situated far from medical centers. As Dr. Oliver Wendell Holmes has said, life at that time was cheap; medical visits in the country were worth only twenty-five cents apiece, and the ambitious student could not afford to make an expensive outlay for his future work. The American Medical Association therefore justly put on record its opinion "that the abuses which exist in the modes of medical education pursued in this country demand the serious

consideration of the profession," and at each meeting it continued to sound a note of warning on this all-important subject. One of the principal reforms which it proposed to bring about was the lengthening of the term of each year from four to six months. To the Chicago Medical College—which was founded in 1859—must be given the credit of having been the first to attempt to lengthen the college course and to establish the system of teaching upon the so-called graded plan. The school was, in fact, organized for this express purpose. Little change was, however, effected by the Association in the methods of teaching at that time, although the discussions which were constantly held was destined eventually to bring forth good fruit. During the following decade little was done in the way of reform.

Referring to the status of medical teaching at this period, Dr. Warren says: "It is not surprising that the best class of students were dissatisfied with the opportunities, and that the number of those who found it necessary to go to Europe to complete their education was constantly increasing." The ambitious young graduates who ventured across the perilous waters in search of additional accomplishments were soon convinced that they had much to learn, especially in relation to clinical and laboratory work, and appreciating the glaring necessity of reformation in the mode of teaching at home, after ample observation of all the improvements of medical art and science abroad, returned to enlighten the profession and become instructors in our native schools. Hence the last few years mark the era of a great change in the history of American medical education. The rising generation of our medical teachers was not content with antiquated methods of a previous century, and all the more advanced methods of instruction have taken their place. The example set by the Chicago Medical College, in lengthening the college course and in establishing a graded course of instruction, has been followed by the University of Pennsylvania, the College of Physicians and Surgeons of New York, the Harvard Medical School, and by nearly every other important institution in this country. This advancement is almost entirely due to the unselfish efforts of the medical profession. When it is considered that the majority of our schools are established without government aid and without liberal benefactors, and must be conducted on business principles with a view to their practical success, this evolution in medical education is entitled to all the greater appreciation.

"There are now in the United States thirty-two examining and licensing bodies that do not give instruction. Although the work of these licensing boards is far from uniform, a great deal has been accomplished by them. There are at the present time fifteen States with Practice Acts that require an examination of all persons desiring to practice medicine in the respective commonwealths. These States include nearly fifty per cent. of the entire population. In many States the whole complexion of the medical practice has been changed by the clarifying influence of these bodies. The reports on medical education, by the Illinois State Board of Health, have exerted a more powerful influence on the movement in education than any other publication which our medical literature has produced. At the present time State examinations are required in Minnesota, North Dakota, Montana, Washington, North Carolina, Alabama, Florida, Virginia, New Jersey, New York, Nebraska, Maryland and Utah." Among the prominent features of modern medical education are those which relate to the character and amount of laboratory work which is now required, which, in addition to medical chemistry, include bacteriology and pathological histology. A type of laboratory course peculiar to the Harvard Medical School is that on the application of bandages and surgical apparatus. "Another subject which is receiving more and more attention yearly is that of clinical instruction. The weakness of this feature of medical education was one of the glaring faults of the old system, and arose out of the fact that hospitals were far less numerous than they are at the present time, and that from the necessities of the situation, the independent origin of the medical school became a custom which has continued almost unimpaired to the present day. In Boston the medical school flourished for nearly one-third of a century before its teachers realized the importance of this problem. A circular was then issued in 1810, in which the statement was made that a hospital was an institution absolutely essential to a medical school." The change of feeling in more enlightened times was indicated by the benefactor of the great Johns Hopkins Hospital, Baltimore. The reaction in favor of clinical teaching is becoming daily stronger, and no school can hope to compete with the great schools of the country which does not have control of what is usually called "clinical facilities." The union between school and hospital in most of our large cities is becoming a more and more intimate one. In this brief outline history of the progress of medical education in the United States, the benefits derived from the schools and hospitals of the great medical centers of foreign countries have been indicated.

Referring to this subject, Dr. Pepper in his recent address, previously mentioned, has

said: "We shall never cease to be proud of our lineage or to acknowledge the immense debt we owe to Europe. Its languages are ours, its glorious past is part of our heritage, its mighty names in art and philosophy and science are household words with us, its rapidly advancing civilization incites us to loftier efforts. But the balance between the old and the new world is being redressed." Again, in relation to this subject, and the prospective results of the recent Pan-American Medical Congress, Dr. John B. Hamilton, as editor of the *Journal of the American Medical Association*, says: "No congress, medical or secular, has ever had deeper motives of patriotism. The medical profession of the Western Hemisphere were anxious to take the initiative steps in the formation of this new medical union, which means the emancipation of the profession of medicine of this part of the globe from European control. This great change can not be immediate, but it is sure. The future medical students of Pan-America will attend the universities of the United States, Mexico and South America. Berlin and Paris schools will attract them no more than the older institutions of Padua and Leyden. The progress of civilization is ever westward. Athens and Alexandria were succeeded by Salerno and Cordova; they in turn by Paris and Edinburgh. Boston and Baltimore now claim a share in the leadership, closely followed by Philadelphia, New York, Chicago and other cities. The medical schools of the United States have done very much in this Columbian year to place them in the front rank, but the history of the evolution of human intelligence shows that these efforts are only bringing into view the eternal principle mentioned by Bishop Berkeley:

Westward the course of Empire takes its way.

"It is in no spirit of self-glorification that we write this article; but no man can conscientiously compare the technique of the methods of the Massachusetts General Hospital, the Pennsylvania Hospital or the Johns Hopkins Hospital without knowing them to be superior to those of the Hotel Dieu, the Moabit or the Allgemeines Krankenhaus. As for the London hospitals, there are none to be mentioned in the same class, except possibly St. Thomas, and that is so cramped in its operation and hampered by traditional customs as to resemble more the institutions of the dawn of the century than those of its close. In the new world, then, we may expect the great university of the next quadri-centennial; and the present status of American medical education as shown in the late Pan-American Medical Congress is such as to warrant the hope that not only will the United States in its turn, for its due season, be the seat of the world's great medical school, but that the time is near at hand."

In the realm of authorship, the American medical profession occupies a position that has secured the appreciation of the civilized world. It has not only contributed standard works upon all the seven primary divisions of medical art and medical science, but has ably covered the many special fields of medicine. If such contributions to medical literature are not as numerous as those of Germany, France or Great Britain, yet they are known to have exerted a powerful influence upon the opinions and practice of the medical profession of Europe, and the works of many have been translated into the languages of all enlightened nations. In regard to the publication of medical journals, we are said to be in advance of all other countries as to number, and from the steady and decided improvement in the tone of their management, they are becoming no less noted for their practical character and scientific merit. In this country and in this progressive age, many original observations and investigations are first seen in periodicals, instead of being reserved to become a part of publications in book form. It may be stated that the extraordinary number of medical journals in the United States is apparently due to the same influences that require the existence of our numerous medical schools and medical societies. The vast extent of our territory and relatively sparse population render it inexpedient and impossible to serve the country with the same number of medical men, medical schools, medical societies or medical journals as may be found sufficient in more densely populated countries. But the rapid rise in the standard of scientific requirements, both of medical men and medical literature, and the appreciation of the fact that a higher medical education is the true interest, both of the profession and the public, are circumstances which operate to check the further establishment of ill-equipped medical schools, or inferiorly edited medical journals, while they stimulate those in existence to more earnest work and still more lofty aims.

In estimating the progress of medical practice since the beginning of the present century, it again becomes necessary to view the conditions of that period. In reference to this subject, Dr. R. H. Dalton, of St. Louis, says: Physicians then were not troubled with obstacles and responsibilities as they are now, as their calling rested on the same basis with all other common enterprises. Practitioners, whether regularly educated or impostors, had

liberty to offer their services, and there was little difficulty in justifying their work among the people, who knew much less about medicine than they do now. Quacks, with fluent speech and popular manners, were sure of success. Opportunities of medical education being restricted, a majority of physicians in rural and village communities were either self-taught or served a term of apprenticeship under some popular doctor of experience. Scarcity of money and difficulty of transportation were hindrances to all but few. Transylvania University was the only school in the West and South, only three of any note were in the North and East, and among these, that of Philadelphia held chief patronage. As far along as 1830, the University of Pennsylvania was crowded with students from New York and the New England States. Medicine was then taught almost entirely from the rostrum, clinics being left out at Transylvania, and occupying only one hour of every week at the Pennsylvania Hospital in Philadelphia. The chairs of theory and practice and the institutes entirely overshadowed all others, and the professors of these were favorites of every class; indeed, they were fairly worshiped. Any octogenarian now living (continues the venerable Dr. Dalton), who listened to Charles Caldwell at Lexington, Kentucky, and Nathaniel Chapman, of Philadelphia, in 1827, will bear witness to this, for he must have been charmed by their eloquence, especially that of Caldwell, who may have had equals in other branches of oratory, but never a superior. His person was of the grandest type, six feet two or three inches tall, well proportioned, straight as an arrow, and modeled like an Adonis. His eye was that of an eagle, and his bald head, with a broad, projecting forehead, thin lips and ruddy cheeks gave him the appearance of a superior being. He never failed to arouse the enthusiasm of the class as he gracefully entered the doorway every day at 10 o'clock, elegantly dressed, and with hat in hand marched up to the rostrum, while the house was shaking with thunderous applause. Booth and Forrest never created a louder stamping of feet. His hour never seemed more than twenty minutes, and while speaking, every action was grace and every word was music. At that early time, medicine could hardly be called a science; the whole practice was more or less imbued with empiricism, for Marshall Hall, Brown-Séquard, Bell and other physiologic discoverers had not yet spoken. Authority was paramount, and he who had the eloquence and logic to maintain his theories, whether they were right or wrong, was always a champion. Didactic teaching was "the order of the day," especially in America, where polemics and democracy dwell together. Humoral pathology and solidism were the principal subjects of controversy, and the forces were nearly equal, the former referring all processes of disease to the circulation, the latter to nervous sympathy. The fiercest battles, however, were fought to decide whether fever is idiopathic or symptomatic. Caldwell, with his rhetoric, was a brilliant symptomatist. According to his view, *ubi irritatio, ibi fluxus* is the *fons et origo* of all disease. And many in his large classes went home thoroughly impressed with his doctrine.

"There were no specialties then, but naturally in every community some practitioner sprang up into notoriety whose genius led him to feats of surgery by which he gained superior fame. Surgery then differed materially from surgery now. Though commanding the most profound admiration of every one, and exalting the bold operator far above his compeers, yet few, even the most talented, ever aspired to that distinction; for in the absence of anesthetics surgery was very little less than human butchery, as it unavoidably tortured the victim of capital operation beyond endurance. Screams of the agonizing patient, wails of the nearest kindred, tears of sympathizing friends, were never absent. Operating surgeons having passed through these sad ordeals were known to weep like children when all was over and they were away from the scene of suffering, and dared remember the tragedy. Language fails to portray the horrors of bloody surgery in the absence of an anesthetic." Yet at this early period Brashear had successfully performed amputation at the hip-joint, McCreary had extirpated the clavicle, and the surgical achievements of Physick, Mott and Dudley for novelty, boldness and success had already secured to their authors a fame that extended throughout the civilized world.

Midwifery in those days was chiefly confided to the care of old women. Physicians were seldom called upon except in difficult cases (mal-presentations, hemorrhage or retention of the "after-birth"). In the few large cities of that period the members of the medical profession were just beginning to reap the benefit of that valuable practice which had been in the hands of midwives since the dawn of its history. Surgical gynecology was unknown then, and horrible cases of vesico-vaginal fistula, uterine fibroids and ovarian tumors were the painful, long-continued preludes of death among women in almost every community. It is true that Dr. McDowell, of Kentucky, had long since plunged his knife through the "sacred" peritoneum, removing a large ovarian tumor, saving a woman's life; but that only

proved in the minds of others that he was a reckless dare-devil, void of conscience, and so the great surgeon and benefactor of woman lived on and died, ignorant of the fact that he had rendered his name immortal. In fact, he might have regarded himself as under the ban of public sentiment. Such is often the reward of manhood and genius. Thus went on the sufferings and misfortunes of the gentler sex till about the middle of the century, when a poor young doctor in feeble health, at Montgomery, Alabama, was known to be harboring, at his own expense, two or three negro women in a small board shanty in his own yard, which was called in derision "Sims Hospital" by his neighboring physicians. These women were victims of vesico-vaginal fistula, and Sims was experimenting to find a substitute for the hollow conical speculum which precluded free manipulative access to the injured parts. In this he succeeded, the rupture was exposed, and nothing remained to secure perfect repair but ordinary mechanical dilatation. His patients were cured, and as he kept on in his line of work, struggling as a young practitioner for means to support his family, unmindful of the witty comments of rivals who criticised his methods of laying the foundation of surgical gynecology, his fame became world-wide, and fortune soon scared away the wolf from his door forever. More than one-third of a century had passed away, continues Dr. Dalton, when it became evident that the domain of medicine was too extensive for the qualification of any individual physician to discharge its functions with intelligence and honest service. Therefore specialties naturally came in vogue, enabling the general practitioner to fully equip himself for any phase of disease in his line, and at the same time the simple stethoscope and the marvelous microscope, with many other minor improvements and facilities of great value, were inaugurated to augment the importance of the medical profession. When the middle of the century was reached, the anesthetic properties of ether and chloroform were discovered, in the application of which was established the most important era in the entire history of surgery, and the science, at a single bound, leaped to the highest distinction. Skilled operators were everywhere seen quietly and leisurely carving the flesh of living, sensitive human beings, while their subjects were wrapped in the folds of lethean bliss. The terrible agonies of frightful operations had ceased forever, and blood in a great measure had ceased to flow by the surgeon's knife as the result of more careful cutting and the use of instruments for its restraint.

"In addition to all this, the great Civil War came in 1861, not only to shake, with terrible vigor, the basis on which our political institutions had rested from the beginning, but to arouse the energies of the American mind, in the way of invention for the benefit and comfort of the race to a degree never witnessed before, and medicine was not left in the rear of that progress." Indeed, it may be said that no event in modern history has given a greater impulse to the advancement of medicine and surgery, and to-day may be seen all over the land physicians and surgeons of the ripest judgment and skill whose stores of experience thus gained has been of incalculable value to them ever since. For the purpose of showing the enormous responsibility of military surgeons during this period the following figures are given, indicating the total number of cases treated in the armies of the United States as derived from the "Medical and Surgical History of the War of the Rebellion." The figures relate to white troops only, and are for the period from May 1, 1861, to June 30, 1866: The total number of amputations of upper and lower extremities were nearly 30,000, and the resulting mortality about 28 per cent. The total number of exsections of upper and lower extremities was more than 4,000, with a resulting mortality of about 36 per cent. The total number of cases recorded in reports of sick and wounded was 5,825,480, with a total mortality of 166,623. The total number of gunshot wounds was 230,018, with a mortality of 32,907. (The total number killed in battle was 42,724.) The total number of deaths from disease was 157,004, the principal causes of mortality being: typhoid fever 27,056 + typho-malarial fever 4,059 = 31,115; chronic diarrhea, 27,558; inflammation of lungs, 14,738; consumption, 5,286; small-pox, 4,717; measles, 4,246; acute dysentery, 4,084; chronic dysentery, 3,229, and remittent fever, 3,853. The total number of cases of gangrene reported as occurring among the wounded of the Union armies was 2,642. Of these, four cases occurred in 1861; 223 in 1862; 623 in 1863; 1,611 in 1864, and 135 in 1865. One thousand three hundred and sixty-one cases terminated in recovery, and 1,142 were fatal, a mortality of 43 per cent.; but in a considerable number of the fatal cases death was due to the original injury, or to other complications, as septicemia and hemorrhage. The total number of cases of traumatic erysipelas reported as occurring was 1,097, with a mortality of 41 per cent. The total number of cases of tetanus reported is 505, or a little more than two per thousand of the total number of injuries by weapons of war. More than one-fourth of the cases followed operations upon the extremities; 116 after amputations, and

fifteen after excisions. "We can scarcely doubt," writes Surgeon General Sternberg, "that a majority, at least, of these cases would have been prevented by modern methods of treatment—antiseptic or aseptic. The same statement applies to the considerable number of cases reported under the heading pyemia. It seems probable that of the 2,818 cases reported under this heading a large proportion were in fact cases of septicemia resulting from wound infection. The very great mortality, and the results of post-mortem examinations made indicate this." In the United States Army since the war, or from 1866 until 1891, the total amputations of upper and lower extremities number about 1,300, with a resulting mortality of nearly 23 per cent., while the total number of cases of exsection of the upper and lower extremities was 74, with a resulting mortality of about 21 per cent. For some years the microscope has been employed to ascertain what part bacteria play in the production of disease, but thus far the investigation has failed to result in entirely satisfactory or positive conclusions as to their pathogenic import. The evidence that micrococci, bacilli and spirilli are the specific cause of infectious disease has been greatly strengthened in this country during the last fifteen years by the careful scientific research of Dr. George M. Sternberg, and his investigations as to their clinical significance as well as to the best means for their destruction are worthy of profound consideration. Whether the microbes are the cause or mere harmless accompaniments of disease, one great benefit has already resulted: aseptic surgery, almost equal to the discovery of chloroform, has been established, and healing by the first intention fairly secured. Whether all putrefactive processes in wounds and the dissemination of contagious or infectious diseases are caused by the development of living organisms, as is generally believed, or partly result from other poisonous agencies, concerning which some difference of opinion may still exist, a substantial agreement prevails that the use of antiseptics renders innocuous certain poisonous matters which are met with in such cases; though the effect is practically the same, if strict cleanliness is enforced and the purification of the air is attained by thorough sanitary measures.

In summarizing the present condition of medical science and medical practice in this country, as elsewhere, it may be said that the general advances of medical knowledge during the last few decades is unequaled by that of any other period in the world's history. We may now say with satisfaction, on looking back to a period within one's memory, that there never before was a time in the annals of our profession that has witnessed so great a zeal in research, or when any approximation to a similar progress in learning or skill has shown itself among physicians and surgeons. "In the recent past problems thousands of years old have been solved while others are rapidly approaching sure solution, thus fulfilling the desires of our predecessors to an extent far beyond their hopes and expectations." In the accomplishment of these achievements which are fraught with such wondrous importance, whether considered in the possibilities of science not yet applied, or in practical results in the general lengthening of human life, or in those which are no less desirable, the decrease of pain and misery, and in the prevention of diseases which afflict our fellow-creatures, American medicine may justly claim an equal part with that of the most enlightened nations.

Medicine, however, is still to be regarded from two standpoints—the scientific and the empirical. "While there is so much unknown in the study of medicine there must be empiricism in its practice. Knowing little or nothing of certain processes of disease, it is guided by broad results, and that is empiricism. Knowing, from previous investigation, something of certain other processes, it is guided by its knowledge of the causation, and that is scientific medicine. Empiricism will become less conspicuous in medicine with a corresponding advance in physiological knowledge, and, with the better means thus afforded to test and investigate its assertions, they will the more quickly be reduced to scientific expression. Medicine thus can claim an independent existence as a practical science—not, of course, independent of biology, or the study of the condition and phenomena of life and of living things—but taking rank as one of its distinct and integral divisions. Intimately related to all the other divisions of physical and natural sciences, and freely giving to and borrowing from them, it yet lives and works in a sphere of its own."

Many medical men in their modern research assume that the study of the intangible vital principle leads to no definite result, and have therefore abandoned its pursuit and even the discussion of its existence, and have devoted themselves to the investigation of the natural phenomena of living bodies so far as they are appreciable by the human senses and intelligence. With them, therefore, the study of life is simply the study of the phenomena, without any attempt to determine its actual nature. Modern physiology recognizes the fact that many of the phenomena presented by living bodies are purely physical or chemical, and

are to be studied by precisely the same methods as may other physical or chemical phenomena seen elsewhere. Such as the mechanism of the joints, movements of limbs upon the trunk, extent, force, and rapidity of muscular contraction in general; the changes which take place in the food during digestion, and in the air during respiration; the exhalation and imbibition of various matters by the blood-vessels in the course of the circulation; the pressure, velocity, and movement of the blood itself, and its changes of color and constitution. While the temperature of the blood is to be ascertained by the thermometer like that of any other fluid, the gases absorbed and exhaled are analyzed. The correct interpretation of these phenomena requires a complete knowledge of anatomy down to the minutest microscopic structures, and the same thing may be said of organic chemistry, so far as relates to the immediate composition of the animal solids and fluids. But after all such experiments and investigations referred to are to be performed upon the living body, since it is the living body alone that the necessary conditions of the vital phenomena may exist, even those of the simplest character. Modern physiology still retains the ancient division of vital phenomena into those of vegetable and those of animal life. The vegetative functions are recognized as those which are common to both the animal and vegetable kingdom, while the animal functions consist in the phenomena of sensation, consciousness, intelligence, of voluntary or excited motion—all, in fact, which bring the animal in relation to the external world through the agency of the nervous system.

As a branch of modern medicine, we are indebted to biologists for the discovery of the physical basis of life, or to the supposed original substance from which all living beings are developed, and which is the universal concomitant of every phenomena of life. "In other words, wherever nutrition and propagation, motion and sensation, exist, there is, as their natural basis, this substance designated in a general sense as protoplasm." In eggs and seeds are the basis of life, but the vital properties exist in a dormant state; but, even presupposing the existence of organized structure, it is impossible to give a precise definition of life. The ancients held that there was an independent entity or vital principle, whose union with the body causes life, and its separation from it death. From the most remote periods in the history of medicine the problem of life has ever baffled solution, even by its wisest investigators, and has in all ages proved the most puzzling question which the human mind has ever attempted to explain. Various modern definitions of life, however, have been attempted. According to Bichat, "life is the sum-total of the functions which resist death." Treviranus makes it "the constant uniformity of phenomena with diversity of external influences," and Beclard calls it "organization in action." In the light of present knowledge, the celebrated definition of Bichat is insufficient and inaccurate, as the opposition or contrariety between life and death upon which it is predicated does not exist. It is now known that in every living substance destructive processes are simultaneous with constructive or organizing, and in this elemental strife the one process is as essential as the other. The absolute dependence of all the vital processes on oxygenation is now fully recognized. "Life forever swings between limits of chemical analysis and synthesis. Oxygen eats into and breaks down the complex molecules of protoplasm; nutrition rebuilds those molecules (nutrition, in fact, is simply organic chemical affinity). Nutrition locks up energy in the molecules produced." By oxygenation the stored-up energies of the body are set free and used in organic function. This is perhaps the highest view of the ultimate condition of life which inductive science yet offers, and has been concisely expressed in the definition of De Blainville: "Life is a double internal movement of composition and decomposition, at the same time general and continuous." In accordance with the most recent biological and pathological research, life and health and disease and death may be briefly defined as follows: Protoplasm is the physical basis of life. Chemical force is the cause of life. Organization, function, and decomposition are the effects of life. Thus it may be said that chemical force, acting upon protoplasm, resulting in organization, function, and decomposition, not only constitutes life, but the harmonious interaction of these conditions, as applied to the physiological elements of the body, likewise represent health; while a perversion or variation of either of these factors as to quantity or condition constitute disease or death, according to the degree of perturbation or alteration which may be established. One of the most important steps in the progress of medicine within the present age is in a more definite explanation of the influence of the predisposing, exciting and determining causes, as well as ultimate nature of disease. "If the study of morbid anatomy received great impetus from the labors of Bichat, the science of histology has been almost created since his day. The simple, rude lens of Leuwenhoeck and Malpighi has been gradually evolved into the compound microscope which has in our day revealed the cellular structure of all organic animal and vegeta-

ble tissue. In consequence of this we have the development of histology on the basis of cellular doctrine. And to the adoption of Virchow's doctrine of cell growth, a large proportion of recent progress in pathology is to be directly or indirectly traced. It is now possible to localize morbid lesions in special tissues, and the autopsy, for the first time in the history of medicine, becomes fruitful in useful results. The natural history of disease (founded by Hippocrates) can now be completed by the pathological lesion revealed. The structure of the tissues and organs in which disease prevails has been exposed, and a distinct structural basis has been given to our knowledge, if not of the disease itself, of the morphological results of the disease. Morbid processes symptomatically indistinguishable, but pathologically distinct, may now be discriminated and individualized. The processes of every disease have been investigated, with general increase of knowledge; prognosis has been given with more certainty and definiteness, and it has been possible to make an exact interpretation of the morbid signs observed. Great and important in itself and its influence on biology, the doctrine of cell-growth has almost revolutionized pathological study." Until the adoption of cellular pathology, as taught by Virchow, the humoral pathologists expressed the idea that the blood was the seat, "almost without exception," of all general diseases, and, further, since purely local disease was considered to be exceptional, the vast majority of diseases were classed under the head of blood diseases. "The healthy condition of the blood was considered by the humoralists to depend upon the normal mixture of its constituents (the *crasis*), and prominent among its constituents were reckoned the germinal substance of the different tissues (*blastemata*), which exuded, through the capillary walls, in the process of nutrition. When the blood-crisis was disordered or diseased, a dyscrasis was said to exist, and dyscrases were held to be, in the majority of cases, primary, though it was allowed that local anomalies of nutrition might, and did occasionally, occur and give rise to secondary dyscrases. A blood disease, or dyscrasis, being established, all morbid changes throughout the body were believed to be but local manifestations of the same." If, however, we accept Virchow's doctrine of cellular pathology in its entirety, we must believe that the blood is, in every relation, a dependent and not an independent fluid, and that the sources from which it is sustained and restored, and the exciting causes of the changes that it may suffer, lie without and not within it. Substances may enter the blood and affect the corpuscles injuriously; the blood may act as a medium in conveying to the organs noxious material that has reached it from various sources; or its elements may be imperfectly restored; but there is never any dyscrasis or affection of the blood itself which is permanent, unless new influences arise and act upon the blood through some channel or through some organ.

At the present time, while it can not be said that humoralism is professed by many pathologists, the notion of blood disease as generally entertained thirty years ago still clings to the nomenclature and pervades some of our pathological doctrines. Diseases that affect the whole economy—such as syphilis, scrofula, tuberculosis, rheumatism, cancer and the essential fevers—are frequently described as "constitutional," or blood diseases. Whether their general manifestations are secondary to local disease, as in syphilis and cancer, or referable to inheritance, they are no doubt dependent upon morbid conditions of blood for their development. Morbid conditions of the blood, as applied to pathological states of the vital fluid are real and numerous, and their association with the development of constitutional disease can be distinctly demonstrated by physical, chemical or histological examination. The system of Virchow, which attempts to explain all morbid processes by reference to the independent life of cells, their active properties, their proliferation and their degeneration, while it ignores or attaches less importance to derangements of the circulation, or to alterations in the composition of the blood in the light of present pathological investigation, can not be accepted. It is true that cellular pathology explains many facts which were before obscure, and the important steps thus taken are not likely to be retraced; but, in several points, modification of Virchow's views has become necessary. As to the origin of new growths, it is not now held that all arise or can arise from connective tissue. The origin, development, progress and transmission of constitutional infectious diseases involve a primary morbid condition of the blood, and even in inflammation it is now agreed that the changes of the tissues, however well established, are only of subordinate importance as compared with those depending upon the circulation.

By bringing to investigation the aid of the microscope the fundamental tissue elements of the corporeal mechanism have been reduced to the nervous, the muscular, the connective tissue, and the cell element. Upon this basis the localization of all morbid lesions is now possible. But the study of pathological conditions relating to any one of these elementary divisions, wide as it may be, is not safe unless with frequent reference to the others for their

aid. Even if it could be made sure that many diseases begin in morbid states of the blood, or nervous system, or any other chief constituent of the body, it would be nearly as sure that within a few hours, or even minutes, of their beginning the other elements would be involved. For the relations of the several parts are so intimate, and through the nervous system and through the circulating blood, their means of communication are so swift that if one be diseased none can long remain healthy. "There is no truth more necessary to be held in pathology and in its practical applications than that the health of each part is a necessary condition of the health of all the rest." For this reason a tendency has been manifested of late years to supplement the analytic method of pathological investigation (which however useful and necessary has been carried to an extreme, and had caused the direction of too great a degree of attention to details and single symptoms) with a synthetic or constructive method of research. As a result of this the study of the ancient doctrines of humoral pathology, which seeks for the causes of disease, or of its first effects in the blood or fluids of the body, has been revived and greatly strengthened by the discoveries of Conheim and other recent microscopic investigators. In recognition of this principle a disposition has arisen with many to regard disease in a broader and more comprehensive manner; to view more prominently the relation of morbid tissues and functions to the organism generally; to emphasize less the variations than the constitutional form of the disease; to recognize in some way or another not only the so-called vital forces, but the indefinable "vital" principle as a governing factor in the morbid process. By the establishment of a common basis of elementary lesions occurring in every part of the body the same pathological processes are found to take place in different structures of the body with primarily the same effects, which are modified only by the function and character of the tissue of the part involved. The abnormal increase of connective tissue in the structure of any organ for instance ends in contraction, compression, and obliteration of the structural element with consequent loss of function. Inflammation occurring in any tissue leads to effusion, extravasation and suppuration. All the elementary processes of pathology may be seen in different tissues and organs producing the same effects, only that the effects are manifested in a manner peculiar to each part; with the same fundamental lesion the disease is the same essentially, although wholly distinct in appearance. Since the vast majority of diseases can be resolved into these fundamental processes, a scientific and durable foundation for pathology is now established, which is of the highest value and significance for philosophical medicine. Under this view diseases of different organs, which until their essential elements were demonstrated appeared to have nothing in common, are now seen to be results of the same process. "Thus a great tendency among medical investigators throughout the world may be observed at work toward the codification and unification of disease, the resolution of complex forms into the simplest elements." The doctrine of unity of disease in which Rush believed, but could not prove, is now being, to some extent, confirmed. Illustrations of the progress that has been made in the scientific and laborious study of forms of disease are afforded in the case of nervous disorders, which are now traced to general changes taking place in other parts of the system; and those processes have been connected with certain signs by which they are recognized clinically. Even in psychological medicine insanity has been demonstrated to be the result of definite cell-change. Mind is now regarded as a phase of force. The inseparability of matter and force is now fully recognized. From the irritability of protoplasm up through reflex action, instinct, memory, reason, and will, the amount of mentality is in direct proportion to the clustered nerve-cells and their structural integrity. The occult mysteries of mental aberration are now studied through the mal-nutrition of nerve-centers. It is now conceded that reason is as much dependent upon an abundant supply of rich oxygenated blood as any other function of the body. The clinical history of other so-called local diseases corresponding with the different physiological systems—namely, the respiratory, circulatory, digestive, and genito-urinary—have also been greatly perfected within the present generation. For this, modern medicine is under the greatest obligation to the fifty years' experience of the late Dr. Austin Flint, as a clinical observer and teacher, and the published results of his formulated views. And some progress can also be claimed in our knowledge of the essential fevers and other general diseases of the system. The nosological division of essential fevers into the periodical, continued, and eruptive is still retained; but an important fact now recognized is that these fevers may be blended; that physicians have to deal sometimes with two fevers combined; that a continued and periodical fever may exist in combination, *e. g.*, typho-malarial; that a continued and eruptive fever, as diphtheria and scarlatina, may co-exist; and that two eruptive fevers, as rubeola and scarlatina, may concur. The Hunterian doctrine that two general

diseases can not be united has been abundantly disproved by modern clinical observation. The rationale of fever and the correlation of the pathological condition to "waste" products of the system, both as to cause and effect, is now more clearly comprehended. Among what is termed general diseases of the system, morbid conditions of the blood elements have received certain and definite explanations. The correlation of syphilis, scrofula, and tuberculosis has, since the days of Lugol, been more clearly traced. And the dependence of such diseases upon morbid conditions of blood-cell elements has been almost positively demonstrated. Gout and diabetes have been elucidated in their chemical results, and have been studied as a question of physiology rather than from a pathological standpoint.

One great advantage that modern medicine may claim is that of an earlier recognition of disease than was possible by its former representatives. "There can be no doubt that in our day we recognize the onset of many diseases much earlier in their history than the most skilled and careful observers of the past generation could have done. This is due not only to increased knowledge of the causes of disease, but also to a more accurate acquaintance with the different manifestations that morbid processes assume. Fifty years ago some affections might have seized upon the victim beyond all hope of recovery before the attendant could dimly realize what was the nature of the illness. But it is now possible to detect these same affections in their insidious onset, and to adopt timely measures for their removal or prevention. No fact is now more fully realized than that a tendency to a morbid state is easily managed, while, on the other hand, the morbid state itself, once developed, may be beyond all control. By appreciating those changes which originate in imperfect blood depuration, or impoverishment of the circulating fluid, and which end in malnutrition, the practitioner knows what will follow, and so prepares to meet the danger." These observations apply with special force to the pre-tubercular stage of pulmonary consumption.

Great and wide progress has been recently made in the study of the symptoms and signs of disease. A definite value and explanation have been given to their significance; their true meaning has been made more clear. "A direct effect of disease has been observed as the natural center of a group of symptoms which, without such explanation, were isolated and unintelligible. While local lesions have been clearly defined, the constitutional effects have been more observed, and these effects always recognized as they have been by signs to which a purely empirical value was attached are now measured with the certainty of scientific observation. The relations of the topical disease to the whole system, usually the main inquiry in each case, are thus determined." The study of disease by the aid of the thermometer, the stethoscope, laryngoscope, ophthalmoscope and other instruments of scientific investigation has been elaborated and formulated to an extent undreamed of by the authors of such methods. With their use a certainty and precision are afforded by signs and conditions which must in all cases be inquired into, but which before the use of such means were most vague and indefinable. Recent progress in this direction, as well as in pathological anatomy, has been largely due to microscopic study. Substantial and important aid has also been given by chemical analysis of the ultimate results or morbid processes. Electricity has been made to contribute materially to the more precise determination of the general effects and conditions of disease, while other means of smaller and more limited scope have assisted to build up a broad basis of semeiology, which is of the utmost value, because it supplies a positive element of the vital power and the constitutional relations of local disease that are fundamental factors in every case, and which could otherwise only be vaguely guessed. By means of animal experimentation and vivisection, physicians and surgeons have of late years gained knowledge concerning the relation of the various organs of the body and their affections, as well as means of repair of lesions, the value of which is beyond estimation.

One of the most encouraging indications of the progress of medicine is derived from a comparison of the state of pharmacology at the present day with that which existed fifty years ago, when we consider the knowledge positively acquired in this time, of the *modus operandi* of many of our most potent and commonly used drugs, not only as regards their local action, but also as to their influence upon the nervous circulatory and respiratory system, as well as upon temperature and the secretion and excretion of various glandular organs, there surely can be no reasonable doubt that at no distant day the pharmacologist will supply the physician with the means of affecting in any desired sense the functions of any physiological element of the body. The isolation of the active principle of a drug is a decided approximation to scientific precision in therapeutics; but the clinical gain from this source is not always certain, for the entire drug is often seen to act with more advantage than the simple alkaloid, even though the latter is practically the therapeutic power of the

drug. Important advance has been made in the principles of the administration of drugs, especially in regard to their application to the part they are designed to affect as directly as possible. By the subcutaneous injection of the active principle of drugs (a method first devised by an American physician, the late Dr. Edward Warren of Baltimore), the effect is more localized and less constitutional disturbance is produced than when the administration is by the mouth. Medicine can be employed in this way, not only with more accuracy, but entering sooner into the circulation it acts more quickly, while the risk of decomposition before absorption, which is incurred by mixture with the digestive fluids is avoided. The old and tried method in therapeutics was that of empiricism, or clinical experience, and that much was accomplished in this way is universally admitted, and in fact, if one leaves out of sight the progress of the last few decades, almost all therapeutic knowledge has been derived from this plan of investigation; but in recent years exact physiological experimentation has done much to raise therapeutics from the position of an empirical art to the dignity of applied science, and we now have a definite physiological aim in the use of remedial measures. Another recent tendency of therapeutics is with reference to a clear insight as to the "synergetic" action of drugs. The modern therapeutists recognize the fact that, by a judicious combination of drugs acting in the same direction, better and more satisfactory results are attained than from either of them alone; and that, in this way, their action is not only increased, but modified to suit different indications, which is not always possible by the use of a single drug, however well selected as to character or dose. The physiological antagonism of drugs recently studied, and taught in the medical schools of this country, more especially by Bartholow and Wood, often leads to the combination of two or more drugs of diverse properties, in order to counteract some unpleasant physiological effect.

It is for these and other reasons that the latest tendency in therapeutics is to revert continuously and partially to the combination of remedies, still following pathological indications, but not submitting the whole plan of treatment to a single dominant symptom. And, in fact, the so-called *pathogenetic* treatment is, as far as can be, taking the place of the symptomatic. This is illustrated in the modern treatment of phthisis pulmonalis. Even in the general management of this malady, instead of the sedative treatment which sent patients to a warm, moist, relaxing climate, a bracing plan of open-air life has been adopted, with far better success. The former method was the treatment of *symptoms*—that is, the cough; the latter is the treatment of the essential disease by improving the constitutional powers and condition. Recognizing the constant and direct influence of the nervous system in every physiological process of the body, some of the most certain and remarkable therapeutic results are obtained by acting upon the nerve centers in the brain and spinal cord, by which these effects are normally induced. Still more striking than the use of drugs in this connection are the results recently obtained by the precisely localized and measured action of heat and cold upon the central nervous system. In these various ways nervous influence is counteracted or subordinated, in place of disturbing the therapeutic plans. The experimentation upon lower animals, and the application of the results thus obtained by analogy to the treatment of disease, has been an exceedingly important factor in our therapeutic progress, and as the laws which govern the susceptibility of animals to different drugs, based upon their difference of organization, becomes more fully developed, the value of such experimentation in giving definiteness and certainty to therapeutics must be recognized as of the highest importance. The sedulous and laborious investigations in this direction by Mitchell, Hammond and other American physicians have been largely instrumental in placing the domain of therapeutics upon a strictly scientific foundation. The growing identification of therapeutics with physiology is also seen in the hygienic treatment of disease. Not only are hygienic measures used for general purposes of advantage, but distinct applications of hygiene employed for distinct physiological effect. Schemes of dietetics, for instance, are not only used with negative precautionary aims, but with positive remedial intentions. By the prevalence of certain climatic conditions, natural or artificial physiological states of the body are induced, and may be calculated upon as distinctly curative. Exercise may be so ordered that particular secretions and processes shall be stimulated while others are unaffected. This mode of treatment has largely displaced the use of drugs, and has greatly diminished the expectation of specifics, if not the desire for them. Improvement in the methods of treatment of the insane has been manifested in the discarding of the system of mechanical restraint and the substitution of judicious mental control in public as well as private institutions established for their cure.

One of the most striking features relating to the present condition of medical practice is that of the almost entire disuse of the lancet. Doubtless many causes contributed to this

result, such as a better knowledge of the nature of some diseases, teaching us that their processes were frequently of a lowering or depressing character, which were to be overcome, not by the abstraction of blood, but by the use of stimulants and support. In such cases, if "antiphlogistic" measures were adopted, they proved failures, and it was found that this art, which had been employed for centuries, was no longer the universal panacea it was supposed to be, and that its abuse led to much evil. Since then a new generation, which knew not the past, has sprung up, and, as in all reactionary movements, the pendulum of popular opinion has swung from one extreme to another, and this remedial agent has fallen into almost complete oblivion. It should, however, be said, in vindication of our predecessors, that for some special morbid conditions, either with or without inflammation, venesection is still regarded by many of our most skilled and judicious practitioners of medicine as one of the most reliable and most potent life-saving therapeutic measures. Past experience and present physiological and pathological investigation have, however, taught the modern physician and surgeon that venesection is distinctly contra-indicated in all forms of adynamic disease and whenever evidence of great depression exists, and that the very young, the old, the feeble and the cathetic do not bear well the loss of much blood. This consideration does not render the topical abstraction of blood by means of leeching, scarifying and cupping inadmissible when such persons are attacked by dangerous inflammation; but it especially enforces the golden rule that no more blood should be abstracted by such agencies than seems absolutely requisite to control the disease.

The antipyretic treatment of diseases, characterized by excessive temperature, by means of cold baths, and with drugs which appear to antagonize the febrile process by diminishing heat production are therapeutic measures of modern origin, which have been found by American physicians of most conspicuous utility in the early stages of disease before adynamic conditions are developed, and in which hyperpyrexia appears to be the chief danger. In this country such treatment is regarded as symptomatic rather than pathogenetic, and in its employment much judgment and discrimination is required upon the part of the physicians. In cases where excessive body heat is regarded as the chief factor in the production of parenchymatous degenerations and other grave results by its control, the treatment is believed to have the merit of scientific precision and to exercise a life-saving influence.

In this country special study has been given to the employment of anesthetics. A considerable number of substances have been used more or less extensively, and their physiological effects have been closely compared. A smaller quantity of the inhalant has been found sufficient, and happier results (in view of the slight danger to life incurred by ordinary inhalations) have been obtained by the method of "mixed narcosis" or the administration of alcoholic stimulants or the subcutaneous injection of morphia and atropia before the use of the inhalant. The more correct principle of local anesthetization in which the disturbance of the system is avoided has been successfully adopted in the application of the freezing effect of the "ether spray" of Richardson, the "rhigolene," of Bigelow and, in minor surgery more especially, by the use of cocaine. The physical and mental quietude induced by general anesthesia, however, still keep a place for ether and chloroform in appropriate cases.

In this country the relation of electricity and disease has been well investigated. By the labors of Beard, Rockwell, Hamilton, Goelet, Newman and other American physicians a precise code of electro-therapeutics has been established. This agent is now not only successfully applied for diagnostic, but for remedial purposes, both in the field of medicine and surgery. It has proved to be of conspicuous utility in the hands of gynecologists, neurologists, laryngologists, and others engaged in special departments of the medical profession.

It may be said that less than twenty-five out of the thousand diseases requiring the study and attention of physicians are known to cause nearly two-thirds of our total mortality. It is known that the application of well established principles of sanitary science will either wholly prevent or mitigate every one of these maladies. The medical profession has taught in the past, and continues to teach, that the attainment of health and longevity requires a constant guard against the malific influence of impurity of atmosphere, water and food, the inheritance of a diseased constitution, the effects of soil moisture, climatic changes, lack of personal cleanliness, and exposure to contagious and infectious maladies. But individual effort can exercise but little influence in protection against either of these factors. The State is the delegated guardian of man's life, as well as his liberty and property. In all sections of this country thousands of infants are annually born into the world inoculated with scrofula, syphilis, consumption, epilepsy, chorea, insanity, or the alcoholic diathesis, and this often to an alarming extent in the highest society of the nation. If the laws of the State are inadequate to prevent the marriage of diseased persons, and to pro-

fect children from inherited maladies, such wrongs to society are always discouraged by an enlightened medical sentiment. Truly has it been said, "The curse causeless shall not come," and in this day of rapid transit the facilities for diffusion of contagious diseases are such as to seriously threaten the welfare of every community. "Failure to exert controlling power over these affections, either through ignorance or negligence, renders the danger to mankind far greater in this period of advanced civilization than in any, even amid the gloom and desolation of the dark ages. No nation on the face of the globe is so constantly threatened with devastation from portable diseases as America. The immigration to this country of people from all the lands of the earth is unprecedented in the history of any other nation. Into our seaports are constantly landed enormous vessels filled with human freight, composed largely of the restless, dissatisfied, turbulent, poverty-stricken, diseased and oppressed people of all climes and nationalities. Into the great harbors of New York, Philadelphia, New Orleans and San Francisco countless thousands of these ragged, filthy and penniless additions to our population, with their bundles of luggage packed amid the squalor and diseases of the dangerous homes from which they emigrated, are hastily thrown upon the wharves, and by hundreds of fast boats are carried over thousands of miles of rivers or over the one hundred and twenty-five thousand miles of railroads, and scattered into every community in America, and with them are carried the infectious diseases of the places from whence they came." And without national or State sanitary surveillance, both at ports of departure and upon arrival in our harbors, the commercial stability, peace, prosperity and happiness of every community are daily jeopardized. Thus are these diseases readily brought into our cities, and as soon as one is driven out another stares us in the face, and the only chance of protection in this day is for the municipality to keep skilled and faithful guardians on the alert to meet and conquer these direful affections. From what is known concerning the predisposing influences of zymotic disease, it follows that the best local sanitation against the development of any one specific disease is almost equally valuable against another. For this reason no community is safe from this class of maladies as long as any one of them is prevalent and will afford the best evidence for improved sanitation. No maxims are more true than a "Nation's health is a nation's wealth," and that "Nothing is so costly in all ways as disease."

But public health can only be advanced by organized effort upon the part of municipal, state, and national authorities, fully empowered by law to enforce the requirements of their important trusts. The members of all organizations to secure these results should be chosen entirely with reference to ability and integrity. Children in all public schools should be educated to understand the elemental principles of physiology and hygiene. Legislators should be educated to understand that the prosperity of our nation depends upon the health of its citizens. Engineers and architects should be educated to understand the most perfect sanitary arrangements for sewerage and ventilation in the construction of all residential or public buildings.

When epidemic disease is decimating a filthy community, the public should remember that nature's inexorable laws are not suspended in this world for man's benefit, and that petitioning for a day of fasting and prayer to stay the pestilence is inexcusable if not blasphemous ignorance, as long as towns and cities are reeking with those causes and sources of infection which breed such maladies. On the great plains of plague-stricken Asia, centuries before the Christian era, the query "Shall such ills come by chance?" was then answered—

"Like the sly snake they come
That stings unseen; like the striped murderer
Who waits to spring from the Karunda bush,
Hiding beside the jungle path; or like
The lightning striking these and sparing those,
As chance may send."

Shall an intelligent people, at the close of the nineteenth century, meet this problem with no more rational interpretation than the ancient Buddhists in the earliest dawn of the world's history? We trust not. But it is the physician after all who, by long experience and the acquisition of the accumulated knowledge of the past, who *knows* concerning the causes and prevention of disease, and to him alone is in reality delegated the high and sacred obligation to preach the gospel of health. All accomplished and successful physicians are in these days also intelligent sanitarians. And recognizing that the health of communities, and even of nations, often depends upon the health of individuals, they, with unselfish devotion to public interest, seek to inculcate among "the laity" all knowledge that experience and observation have taught relating to personal and domestic

hygiene, in order that the greatest good may result to the greatest number. Under this policy results of the most important character are constantly being obtained in what is termed public hygiene. Even by the most rudimentary or imperfect methods of sanitation, which as yet alone is practicable, the most terrible forms of disease have been banished, and other contagious and infectious diseases have assumed a much milder form. With more efficient sanitary measure all of the so-called *zymotic* and *specific forms* of disease which have so scourged the world will certainly become more and more rare, if they do not altogether disappear.

Whatever may be the final outcome of earnest effort in this direction, an honest review of the last half century will show that our profession has secured to our country, independently of its grand achievements in the way of sanitation and quarantine, ever-lasting benefits, entitling it to the highest honor; but when we take into consideration the fact the nation's health and vigor have in the meantime been fortified by medical science against the assaults of deadly epidemics that sacrifice so many thousands of human beings every year to the Moloch of contagion, the obligation is startling in its magnitude. Hitherto all efforts to guard or promote public health have been, as stated, more or less due to the spontaneous intervention of physicians, supplemented occasionally by State or local authorities, but now there is a reasonable and earnest expectation and demand that the general government shall recognize such efforts by creating a Department of Public Health, in which its secretary shall have a rank, influence and prerogative equal to that of any other cabinet officer.

EMINENT AMERICAN PHYSICIANS AND SURGEONS.

ABBOTT, Luther J., of Fremont, Nebraska, son of the late Dr. Nicholas Abbott, of Troy, Ohio, was born at Blue Hill, Me., September 15, 1831. His literary education was received at St. Johnsbury Academy, Vermont, and his medical education under Professor R. D. Mussey, at the Ohio Medical College, Cincinnati, and at the Jefferson Medical College, Philadelphia. He was graduated at the last named institution in 1854. After association with his father in the practice of his profession a few years he removed to Nebraska in 1861, and has been a resident of the town of Fremont, in that State, since 1867. Dr. Abbott has performed all ordinary surgical operations, and all the difficult obstetrical operations, besides many others of an important character. It is said that his practice has been so extensive that he has frequently ridden one hundred miles in a day to attend his patients. He aided in the organization of the Dodge County Medical Society, and became an early member of the Nebraska State Medical Society, of which he was elected president in 1877. He was appointed United States Examining Surgeon for Pensions in 1871 and has served in that capacity for many years, and has also served three times as a member of the Nebraska State Legislature. He has taken much interest in business affairs as well as professional, and has been either president, director or secretary of nearly every organization in the city of his residence. He has made frequent contributions of an important character to his State Medical Society.

ABBOTT, Samuel Warren, of Wakefield, Mass., was born at Woburn, that State, June 12, 1837. His father descended from George Abbott, who emigrated from England, about 1640, and his mother from Edward Winn, who emigrated from North Wales about 1642. Both settled in Massachusetts. The subject of this sketch was educated at Phillip's Academy, Andover, Mass., and graduated at Brown University (Rhode Island), in 1858. He began his medical studies under the preceptorship of Dr. Benjamin Cutter, of Woburn, and attended lectures at Harvard Medical School and the University of Pennsylvania. He received his medical degree from Harvard in 1862. He was appointed Assistant Surgeon, United States Navy, in November, 1861, and served at Charleston Navy Yard, Chelsea Hospital and on United States Steamships Tioga, Catskill and Niagara. He resigned his position in the Navy, May, 1864, and the following September was commissioned Assistant Surgeon in the First Massachu-

setts Cavalry. In December of the same year he was promoted to the rank of full surgeon of his regiment and was mustered out of the service in July, 1865. Dr. Abbott has taken much interest in Public Hygiene. From 1872 to 1877 he was Coroner of Middlesex county, Mass., and under the law abolishing the coroner system, he became Medical Examiner for the county and served from 1877 to 1884 in the latter capacity. He practiced medicine at Woburn, four years and at his present place of residence for the last sixteen years. He was Health Officer of Massachusetts from 1882 to 1886 and has been secretary of his State Board of Health from 1886 to the present date. He was President of East Middlesex Medical Society from 1874 to 1875. He has contributed important articles to the literature of the profession, among which may be mentioned, "Uses and Abuses of Animal Vaccination," American Public Health Transactions, 1882; "Defects of the Coroner System," Forum Magazine, 1890; "What Constitutes a Filth Disease," American Public Health Transactions, 1890; "The Influenza Epidemic of 1889-90," State Board of Health Report, 1890; "The Distribution of Diphtheria in Massachusetts," International Congress of Hygiene, London, 1891; "The Evidences of Still Birth," Transactions of Massachusetts Medico-Legal Society, also various papers in support of the Metric System and upon other subjects of professional and public interest. Dr. Abbott is a member of the Massachusetts Medical Society, Massachusetts Medico-Legal Society, Massachusetts Association of Boards of Health, American Medical Association, American Public Health Association, American Statistical Association, and the New England Meteorological Society. He is also an Associate of the Societe Francaise d' Hygiene.

ABERNETHY, Jesse Jones, of Alton, Tenn., was born in Sussex county, Va., August 29, 1817. He was never a student in a literary college, but partly in Virginia and partly in Tennessee the time of his boyhood and youth was divided between farm labor and the acquisition of a moderate English education, including the higher branches of mathematics. In 1838 he began the study of medicine under Dr. R. G. P. White, of Pulaski, Tenn., and was graduated M. D. at the medical department of the University of Pennsylvania in 1841. He soon after located at Murfreesboro, Tenn., and remained there and in Franklin county, that State, in active general practice for about twenty-five years. In 1860 he was appointed

Professor of Theory and Practice of Medicine in the Shelby Medical College at Nashville but resigned the position soon afterwards. In 1877 he moved to that city to accept the chair of Nervous Diseases and Clinical Medicine in the Nashville Medical College. He became a member of Rutherford County Medical Society in 1846, elected president thereof in 1848; of the Tennessee Medical Society in 1850, elected treasurer in 1852. In 1876 this society was reorganized under the name of "Medical Society of the State of Tennessee," at which time he was elected president, and during the same year he was elected president of the Medical Society of Franklin county, Tenn. Among his more important contributions to medical literature may be mentioned the following articles: "Tetanus," 1852, "Peculiar Form of Intestinal Obstructions with Cases," 1861, "Some Effects of Diet on Parturition," 1873, and "The Best Methods of Preventing Tuberculosis," which have been read before the Medical Society of the State of Tennessee.

ADAMS, John Smalley, of Oakland, California, a lineal descendant of Samuel Adams, of Massachusetts, was born at Highgate, Vermont, December 24, 1830. His professional education was received at Albany Medical College, N. Y., whence he was graduated on his twenty-fifth birthday. Early in 1856 he established himself at Troy, N. Y. In 1859, broken health compelled the temporary abandonment of his profession and as a sanitary measure, in 1863, he removed to California. Having recovered his strength he established his residence in the Napa Valley and resumed and actively engaged in practice until 1874, when his health again became impaired. Recovery followed upon a visit to Europe, during which he continued his professional studies in the leading hospitals of Great Britain, and returning to America he finally established himself at Oakland, California, where he has pursued his professional avocation for the past twenty years. In the course of his practice he has performed various capital surgical operations. He is a member of the Alameda County Medical Society and of the California State Medical Society. Of his professional publications, the most important is a paper upon "Freezing for Sciatica," which appeared in the Pacific Medical and Surgical Journal (July, 1870), and in which attention was called for the first time to this method of treatment.

ADLER, John M., of Philadelphia, Pa., was born in Georgetown, D. C., August 9, 1828. His classical and literary education was obtained at Princeton College, N. J., from which he graduated in 1847; and his medical studies were pursued at the National Medical College, Washington, D. C., where he graduated M. D. in 1850. He then went to Central America and during the construction of the railroad from Aspinwall to Panama from 1851 to 1855, he was surgeon of the Panama Railroad Company. In 1857 he married the eldest daughter of the late David Gilbert, M. D., of Philadelphia, after which he established himself in practice at Davenport, Iowa. During the rebellion he was Acting Assistant Surgeon, United States Army, in charge of the General Hospital at that city. In 1865 he removed to Philadelphia, where he has since remained. He is a member of the College of Physicians and of the County Medical Society of Philadelphia.

AGARD, Aurelius H., of Oakland, Califor-

nia, was born in Wadsworth, Ohio, October 10, 1822. He is of English descent. After receiving an academic education he studied medicine under the preceptorship of Dr. A. Fisher, of Western Star, Ohio. He attended lectures at the Cleveland Medical College and Jefferson Medical College, Philadelphia, and was graduated M. D. at the latter institution in 1849. He first located in the town in which he had studied medicine and remained there seven years; he then established himself at Sandusky City, where he practiced his profession until 1875, when he removed to Oakland, California. He has been vice-president of the Ohio State Medical Society and has been a member of numerous other medical organizations, including the Medical Society of the State of California, and the American Medical Association. Dr. Agard served thirteen years as Pension Surgeon at Sandusky, Ohio, and has written some important papers for the leading medical journals.

AGNEW, Cornelius Rea, of New York, N. Y., was born in that city August 8, 1830, and died there April 18, 1888. His ancestors were Huguenots, Scotch and North Irish. His paternal ancestors left France at the revocation of the edict of Nantes, and settled in the northern part of Ireland, near Belfast, where they identified themselves with the Scotch Presbyterian church. His grandfather, John Agnew, came to America in the year 1786, and at first took up his residence in Philadelphia. Shortly, however, he removed to New York City, where he settled permanently, and became engaged in the tobacco, commission and shipping business. He was succeeded by his son William, a native of Philadelphia, who had been associated with him as partner several years. William Agnew remained in business about sixty years, and became a leading merchant of New York. Early in life William Agnew married Elizabeth Thomson, a member of an old Scotch family which came to America during the year 1771, and settled in Franklin county, Pa. The father of this lady was by profession a surveyor, and surveyed the national turnpike that was built from Chambersburg, Pa., to Baltimore, Md. The subject of the present sketch was the son of William and Elizabeth Thomson Agnew. "His early education was received in private schools, and he was prepared for college by William Forest, of New York. In 1845, being then but fifteen years of age, he entered Columbia College and after pursuing the usual course was graduated in 1849. He began the study of medicine under Dr. J. Kearney Rogers, for many years surgeon to the New York Hospital and to the New York Eye Infirmary, and also Professor of Anatomy in the old College of Physicians and Surgeons. He attended the regular course in the College of Physicians and Surgeons, and while pursuing his studies entered the New York Hospital as junior walker, receiving shortly afterwards an appointment as senior walker. In 1852 he graduated, and passed the following year as house surgeon in the New York Hospital, of which he became also curator." In 1854 he went to the shores of Lake Superior and abode and practiced one year in a small settlement in the mining regions on Portage Lake, where now stands the flourishing town of Houghton. "He then returned to New York, having received the unsolicited appointment of surgeon to the Eye and Ear Infirmary in that city, and

went to Europe to complete his studies to comply with the conditions of the appointment. In Dublin he became a resident pupil of the lying-in asylum, and also attended the clinics given by William Wilde, afterwards Sir William Wilde, at St. Mark's Eye and Ear Hospital in the same place. Subsequently he visited London, and walked its hospitals, observing the practice of William Bowman and George Critchett, and attending the clinical lectures of William Ferguson. He next visited Paris, where he observed the practice of Velpeau and Ricord, of Sichel and Desmarres in diseases of the eye, and that of Hardy in diseases of the skin. Upon his return to America, in 1855, he established himself in New York as a general practitioner. In 1856 he was married to Mary Nash, daughter of Lora Nash, of New York, merchant. He held his position as surgeon to the New York Eye and Ear Infirmary till April, 1864, when his duties on the United States Sanitary Commission compelled him to resign rather than to impose additional labor upon his colleagues in that institution. In 1858 he was appointed surgeon-general of the State of New York by Governor E. D. Morgan. At the commencement of the civil war the same governor appointed him medical director of the State Volunteer Hospital, New York, in which position he performed most efficient service. For a long time he had charge of the important trust of obtaining for the regiments passing through New York to the seat of war their medical supplies, being the representative in this work of the surgeon-general of the State of New York. When the famous United States Sanitary Commission organized and proceeded to secure as colleagues gentlemen supposed to possess special qualifications, Dr. Elisha Harris and Dr. Cornelius R. Agnew were unanimously elected at the first meeting, and to the labors of Dr. Agnew no slight share of the success which attended the commission is to be attributed, as the following extract taken from Charles J. Stille's history thereof proves: "Dr Agnew brought to the service of the commission the valuable experience he had gained while performing the duties of a medical director of the troops then being raised in New York. He soon exhibited a practical skill, executive ability, and at all times a perfect generosity of personal toil and trouble in carrying on the commission's work, which gave him during its whole progress a commanding influence in its councils. Oppressed by serious and responsible professional cares, he nevertheless watched with keenest interest over the details of the commission's service, and he set an example of self-sacrifice and disregard of personal interest when the succor of the soldier claimed his attention, or required his presence. It is not too much to say that the life-saving work of the commission at Antietam, the relief which it afforded on so vast a scale after the battles of the Wilderness, and the succor which it was able to minister to thousands of our soldiers returning to us from rebel prisons diseased, naked and famishing, owed much of their efficiency and success to plans arranged by Dr. Agnew, and carried out at personal risk and inconvenience under his immediate superintendence." In conjunction with Drs. Woolcott Gibbs and William H. Van Buren, Dr. Agnew prepared for the quartermaster's department the plans which were subsequently carried out

in the Judiciary Square Hospital, at Washington, and were more or less accurately followed in the pavilion hospital system of the war. "Dr. Agnew was one of the four gentlemen who founded the Union League Club in New York City, an organization from which the Government derived the most material assistance during the civil war, and which proved no slight factor in supporting the flagging energies of both the people and the Government during the darkest hours of the rebellion." In 1866, he established in the College of Physicians and Surgeons, an ophthalmic clinic, having been asked by its faculty to do so, and in 1869 was elected Clinical Professor of Diseases of the Eye and Ear. In 1868, he originated the Brooklyn Eye and Ear Hospital, and in 1869, the Manhattan Eye and Ear Hospital, New York. In 1865 he was appointed one of the managers of the New York State Hospital for the Insane, at Poughkeepsie. He has been twice reappointed, and held from the inception of the undertaking the secretaryship of its executive committee. The educational institutions of the State and city have also received a share of his attention. In 1859 he was elected one of the trustees of public schools in New York City, and subsequently was chosen president of the board. In 1864 he was chosen one of the associate trustees to organize a school of mines in Columbia College, and on February 2, 1874, was made one of the trustees of the Columbia College. Dr. Agnew has taken a deep interest in everything relating to the public health, and has contributed some papers to the literature on this subject. He was secretary of the first society that was organized in New York City for sanitary reform, and a member of the committee that prepared the first draft of the city health laws. He also was a member for many years of the Century Club. In 1872 he was chosen president of the Medical Society of the State of New York. He was also a member of the following scientific societies: Medico-Chirurgical Society of Edinburgh, Scotland, New York Academy of Medicine, New York Pathological Society, Medical and Surgical Society of New York City, American Ophthalmological Society, of which he was for several years president, American Otological Society, New York Ophthalmological Society, in which he aided in founding, International Ophthalmological Society, International Otological Society, Medical Society of the County of New York, and the New York Academy of Sciences. He attended the International Medical Congress at the Centennial meeting at Philadelphia. During the last thirty years of his life he devoted himself particularly to diseases of the eye and ear. As a lecturer Dr. Agnew was fluent and practical. As an ophthalmologist he was widely known. He has contributed useful articles to current medical literature, and published a number of brief monographs relating to ophthalmic surgery, also a series of American Clinical Lectures, edited by E. C. Seguin, M. D., of New York.

AGNEW, David Hayes, of Philadelphia, was born in Lancaster county, Pa., November 24, 1818, and died March 22, 1892. As the subject of this sketch was so widely loved as a man, and occupied so prominent a position in the profession, his life and decease require a more extended mention than usually allotted by a chronicler of contemporaneous medical history. Originally of French extraction his ancestors

early settled in Scotland, and his more immediate progenitors came to this country about the year 1700. His father, Dr. Robert Agnew, is described as a courtly gentleman of the old style, of imposing appearance, genial manners, of a benevolent disposition and as the leading physician of his county for nearly a half century. His mother, Agnes Noble, was a granddaughter of William Noble, of Chester county, Pa., a name prominent in the early annals of Presbyterianism in America. She is said to have been a woman of great natural strength of character and lived to the advanced age of ninety-one. Dr. Agnew began his classical education at Moscow Academy, a flourishing Chester county institution of the period, in charge of the Rev. Francis Latta. Next he studied at Jefferson College, Canonsburg, Pa., subsequently completing his general education at a college in Newark, Del., where a cousin,

Dr. Robert Agnew.

the Rev. John Holmes Agnew, was professor of languages. Choosing medicine for a profession, he entered upon its study at the University of Pennsylvania, whence he graduated April 6, 1838. Returning to his native place, he entered upon the practice of medicine, without, however, relaxing his studies. Here he was married to Margaret Creighton, second daughter of Samuel Irwin, of Pleasant Garden Forges. To her and her advice he ascribed much of his success. After some years' practice of medicine in Lancaster county he embarked in the iron business, but, after a brief period, he returned to medical work, and eventually removed to Philadelphia, determined to embark upon the profession in that city. This he did, notwithstanding that he was entirely without friends or influence, and had nothing to look to for success save his own ability, industry and his knowledge of medi-

cine. Shortly after going to Philadelphia he began the delivery of a course of lectures at the famous Philadelphia School of Anatomy, then on College avenue, the course continuing many years, contributing to the reputation of the institution and establishing the fame of the lecturer on an enduring basis. So widely did the school become known that, at the outbreak of the civil war, his class numbered 265 students, representing nearly every State in the Union, and being the largest class in the country studying under one teacher. In connection with this time-honored institution he also established the Philadelphia School of Operative Surgery. In 1854 Dr. Agnew was chosen one of the surgeons of the Philadelphia Hospital, where he left a perpetual memorial of his labors in the founding of the present Pathological Museum, of which he was for a long time curator. In 1863 he became by appointment, Demonstrator of Anatomy and Assistant Lecturer on Clinical Surgery in the Medical Department of the University of Pennsylvania. In 1864 he was chosen one of the surgeons of the Wills Eye Hospital. One year later he was appointed on the surgical staff of the Pennsylvania Hospital, when the inauguration of a policy with which he could not agree compelled him to resign. But in 1877 the Board of Managers of that institution, of its own volition, elected him to his former place, an occurrence without parallel in the history of the institution. In 1867 he was chosen as one of the surgeons in the Orthopaedic Hospital. An experience which proved most valuable in fitting him for his subsequent great responsibilities was his service as consulting surgeon at the great Mower Army Hospital, which was located at Chestnut Hill during the war. It was the largest hospital in the country and was under the care of Dr. Joseph Hopkins. Forty-seven physicians comprised the resident staff, while Drs. Agnew and S. K. Morton alternated as consulting surgeons. All the most dangerous cases came under their notice in this capacity, and all the most difficult operations under their hands. Gunshot wounds of course formed a large proportion of the cases, and at one time the number of these reached 5,000. Meanwhile Dr. Agnew had resigned his position at the School of Anatomy and shortly afterwards the institution went out of existence. He was the first to bring the school into prominence, and when he resigned its mission was over. It was a vehicle through which his wide knowledge of anatomy and his lucidity as a lecturer first became known. It was at this period he built enduringly for the future. The secret of his success was his constant dissecting in the early days of his professional career. For eight years he spent every day from breakfast until half-past 10 o'clock at night dissecting in the School of Anatomy, originally on College avenue, but later back of St. Stephen's Protestant Episcopal Church, the only intermissions being for dinner and supper. This was the basis of his great knowledge of surgical anatomy, and he was the best surgical anatomist in Philadelphia. In 1868 he experimented at the Pennsylvania Hospital, with the assistance of Dr. Henry C. Chapman, who is now Professor of Physiology at the Jefferson Medical College, on the periosteum, or lining of the bone, with considerable success. He showed that it developed bone by transplanting pieces of this membrane from the leg of a

chicken to its head and by winding a piece of it around a fowl's leg, which finally formed a circular bone around the limb. The main value derived from these experiments was its service in the repair of fractured bones, because it was demonstrated that if any of the living membrane was left the bone would grow from it. It had the effect of showing that in many cases amputation would be unnecessary. Beginning his connection with the University of Pennsylvania, unofficially as a clinical assistant and adviser of the Professor of Surgery, the late Dr. Henry H. Smith. Dr. Agnew was in 1863 appointed by the faculty to the position of Demonstrator of Anatomy, succeeding in that capacity Dr. Wm. H. Hunt and Dr. John H. Packard. He now officially took part also in the Surgical Cliniques of the University, and so valuable an accession to its teaching corps did he prove himself, that in 1870, at the request of the faculty, the trustees revised the chair formerly held by the late Dr. George W. Norris, changing its title to that of Clinical and Operative Surgery, and conferring it upon Dr. Agnew, who thus became a member of the University's Faculty of Medicine. In the following year Prof. Smith resigned the chair of the Principle and Practice of Surgery and Dr. Agnew became his successor, thus uniting the surgical teaching in a single person. In connection with this he acted as Professor of Clinical Surgery in the University Hospital. This period marks an epoch in his life work. His anatomical knowledge and his succinct, lively and lucid style of lecturing at once made his amphitheater an attractive spot for the medical student. His unflinching courtesy established from the outset a cordial feeling between him and his pupils which was never disturbed. The scenes at his clinics were always interesting. Recognized as one of the most noted surgeons in the world, Dr. Agnew operated at clinics clad usually in a very old "duster," which was, however, always scrupulously clean. Buttoned close up in front the "duster" was frequently frightfully rent behind. He operated with great rapidity, and his celerity in cutting was famous. Frequently he would have to stop lecturing, explaining the operation after it was performed. On such occasions he would say: "Watch me, men, I have no time to talk. To business now." His wonderfully minute anatomical knowledge enabled him to know within a hair's breadth where he was operating. An observer once said: "Dr. Agnew always appears to have the exact bearings of the different organs and tissues as vividly before his eyes as if the outer ones were made of glass." He resigned his position at the University in 1889, and had since been Emeritus Professor of Surgery and Honorary Professor of Clinical Surgery, the position being created especially for him. At the time of his resignation, his friends with the graduating class commemorated his retirement by the presentation to the University of a fine portrait in oil of the beloved professor. Probably the most famous case with which Dr. Agnew was connected was that of President Garfield, who was shot by Charles J. Guiteau, July 2, 1881. The doctor was called to Washington by the attending physicians on July 5, and from that time until the death of the victim of the assassin's bullet on September 19, he was assiduous in his devotion to the illustrious patient, being in daily communication with

the attending surgeons and visiting the President twice each week. Through the judgment and decision of Dr. Agnew the life of the President was undoubtedly maintained nearly three months. The President had a mortal wound, and the advantages the prolongation of his life gave to the country, allowing the feeling of alarm, unrest and anger to subside, can not be over-estimated. Dr. Agnew's skillful hand twice brought relief when unfavorable symptoms seemed to be gaining the mastery. When Dr. Bliss handed the knife to Dr. Agnew and invited him to perform the first operation, the eyes of the entire country were upon it. This acknowledgment of Dr. Agnew's ability was recognized as peculiarly appropriate by professional men, and drew public attention more generally than ever to the honorable career which called for such a recognition. Dr. Agnew's characteristic conscientiousness was shown in that, although he paid unremitting attention to his illustrious patient, he did not allow it to imperil the welfare of the humblest of his patients in Philadelphia. Dr. Agnew had been president of the American Surgical Association of the Philadelphia County Medical Society, the State Medical Society, the College of Physicians and of the Academy of Surgery, and was one of the founders of the Pathological Society of Philadelphia. He was also early identified with the American Colonization Society, of which Henry Clay was President. His popularity among his colleagues and the esteem in which he was held by the medical profession generally, was conspicuously shown on the fiftieth anniversary of his graduation in medicine, April 6, 1888. On this occasion more than 200 prominent physicians gave him a dinner at the Academy of Music. Dr. J. M. Da Costa presided, and on his right sat Dr. Agnew, Alfred Stille, Louis A. Sayre, of New York; S. Weir Mitchell, Hunter Maguire, of Richmond, Va.; Dr. William Pepper and J. S. Billings, U. S. A., of Washington. To the left were seated the Rev. J. S. MacIntosh, LL.D., the Rev. Dr. B. L. Agnew, Drs. J. Ford Thompson, of Washington; W. S. W. Ruschenberger, R. F. Weir, of New York; Professor Joseph Leidy and Charles C. Lee, of Richmond, Va. In his address on that occasion Dr. Da Costa said in part: "Fifty years ago there stood, with the honors of a university just received, a young man on the threshold of his life. His thoughts were the pleasant ones of the occasion; his aspirations had hardly taken shape; he was the popular comrade of the 155, whose real life like his own was to begin. Fifty years have passed, and their Agnew has become our Agnew of the many thousands of the American profession." Dr. Da Costa also spoke of the influence that the Philadelphia School of Anatomy, on College avenue, with which Dr. Agnew was connected, had on the history of medicine, and said to the guests of the evening: "You have been tried in many hard cases. In none harder than when your reputation caused you to be selected among the counselors at the wounded couch of one for whose relief millions were anxiously watching. That, in these trying times, you bore yourself with the same calmness and dignity we know in you, everyone in these millions recognizes." In his response Dr. Agnew said that about thirty-five years ago he came to this city a stranger. The scene of his early labors was in College avenue at

the Philadelphia School of Anatomy, and it was with this private institution that Godman Webster, the elder Pancost and Allen laid the foundation of their reputations. Gerhard, Wallace, Bridges, Keating, Henry H. Smith, Francis Gurney Smith, J. H. Brinton, J. E. Garretson and W. W. Keen were connected with it. "It was here," continued the speaker, "that Brown-Sequard delivered his lectures on operative physiology, and it was here that Mitchell conducted his classic experiments on snake poison and on many physiological problems, which have placed his name alongside that of Farrar and given him a place among the scientists of the present day." In conclusion, he said: "This is a great honor you have done me to-night. How long I may be able to continue in this good service I know not. This I leave to the wisdom of Him who numbers the hairs of the head and notes the flight or the fall of the sparrow. When that supreme moment shall come I shall be satisfied." Dr. Agnew was followed by Dr. Sayre, of New York, who replied to the toast, "Our Invited Guests," and suggested that it was the honored guest's pure and unsullied life, his strict integrity and constant devotion to his profession that brought him the praise of all his brethren. Dr. Mitchell began with a prose preface, and then read his poem, "Minerva Medica," in which he spoke of the anniversary as of a "golden wedding," concluding with the following stanza:

"What be the marriage gifts that we can give?
What lacks he that on well used years attends?
All that we have to give are his to-day—
Love, honor and obedience, troops of friends."

Dr. Cleeman then moved the formal adjournment of the dinner, after which Dr. Thomas Wistar read an ode dedicated to the distinguished guest of the evening. Dr. Agnew's writings, combining as they do, the results of his wide reaching, varied experience and comprehensive observations, are regarded as high authority. He was the author of a "Practical Anatomy," a work on "Ulcerations of the Perineum and Vesico-Fistula," and of sixty papers on "Anatomy and Its Relation to Medicine and Surgery." In addition he has contributed extensively to medical journals. The work of his life, however, was spent on the exhaustive publication, "The Principles and Practice of Surgery," in three volumes of more than 1,000 pages each. This work, which was completed in 1883, has attained the distinction of being translated into the Japanese language, and is unique in the history of surgical literature, being the only complete treatise on surgery in all its ramifications, in which the data were drawn from the author's own experiences and observations. Such a work could not have been done before Dr. Agnew's time, for he began it prior to the introduction of anesthesia, and as surgery expanded his qualifications kept pace. It can not be done again, as the field is now too vast. Dr. Agnew's death occurred at his residence in Philadelphia, when in the seventy-fourth year of his age. His illness was superinduced by three attacks of influenza in as many succeeding years. Upon the occasion of his death, Dr. William Pepper, Provost of the University of Pennsylvania, said: "I feel that the community, the medical profession, and, in a special sense, the university and her students and graduates, have met with an irreparable loss in the death of Doctor Agnew—America's

greatest surgeon. Since his graduation from the medical department in 1838," Dr. Pepper continued, "the welfare of the university has been one of the chief interests of his life. His influence in the councils of this institution was unsurpassed. He was always on the side of progress and improvement in medical education, and I must attribute to him a very large share of the great prominence and prosperity of the medical department of the university at the present time. I have known him to travel in consultation, night after night for a week or ten days at a time, and yet never miss his lecture hour or daily visits to the hospital. As a teacher of surgery he has never been surpassed; he made no effort at display and wasted no time in mere eloquence. His instruction was earnest, clear and practical, and was evidently stamped with the seal of mature experience and honest conviction, carrying great weight and leaving lasting impressions. I am confident he was consulted more frequently than any other American surgeon, for he was an ideal consultant. Not only could his judgment and skill be trusted, but his discretion and high sense of professional honor were equally reliable. His sense of duty was the controlling principle with him throughout his life. His convictions were earnest and even rigid, and it was impossible for him to swerve from a course of conduct when he felt that that position was right. He could be stern and unyielding in his denunciation of wrong-doing, although most kindly and indulgent in his general intercourse, and he abhorred meanness and falsehood. His patients were devoted to him to such an extent that it was impossible for him to limit his practice to strictly surgical cases. His relations with medical students were peculiarly close and cordial; they all loved him dearly and revered him highly, and it is not too much to say that, to the many thousands who have graduated under him, he has been to all the highest type of what a medical man should aim to be. He has had every reward that the profession and the community could bestow upon him, and to the last he remained the same brave, modest, true-hearted man." "He was one of the greatest medical men of our time in the branch of surgery," said Dr. White, "and will be greatly missed by professional men, as well as the larger circle of the people. He was a great writer on surgery and his works are standards. I was closely associated with him in many ways and knew well the value of his friendship and the weight of his counsel." Dr. W. H. Pancoast, the eminent surgeon and anatomist, said: "Dr. Agnew was an excellent conservative surgeon, one who operated to save and cure, not merely to operate. A scientific surgeon, representing surgery as it is—operative medicine. Where medicine fails, there often surgery can cure. Being a thorough anatomist, he thoroughly understood the human machine on which he was manipulating with medicine and instruments. Every surgeon should be as familiar as he was with the human frame or they can not be equal to the demands made upon them by accident or disease." Upon this occasion Dr. A. R. Thomas also said: "Dr. Agnew was not only one of the greatest surgeons of his time, but as a man he was superior in every respect. He was a man liked in all his views, and will be more missed by the medical profession than any man we

have had for a long time in the past or have in the present, particularly for his honesty as a surgeon and a professional man. He was more easily approached than almost any man in the profession, and his opinion more valued than almost any one that I can name. His good influence did not end here, for his contributions to medical literature, particularly his works on surgery, always have had great weight and been appreciated by his professional co-workers." A special meeting of the College of Physicians was held to take action upon the death of Dr. Agnew, who had been its presiding officer during the preceding year. A minute was adopted of resolutions of respect and condolence, a copy of which was directed to be sent to the family, and the Fellows of the College decided to attend the funeral in a body. The members of the faculty of the medical department of the University of Pennsylvania also met and adopted resolutions upon the death of Dr. Agnew, setting forth among other things, "their appreciation of the nobility of his personal character and the enduring excellence of his professional achievements. As a didactic lecturer he was unsurpassed. As a clinical lecturer his enormous experience and his diagnostic and operative skill made him pre-eminent. That skill which amounted to genius was the foundation of his scientific greatness and often enabled him at a glance to detect conditions which had eluded the investigation of others." The following may be quoted as the general professional estimation of the life and work of this world famous surgeon. "Dr. Agnew was fortunate in the time of his birth, for he saw surgery grow to a great science in his lifetime, and he possessed the abilities to keep abreast of all advances. In this he was as fortunate as his fellow professor, Leidy, was in the domain of biology. This characteristic of keeping abreast with the times he ever preserved. His clear judgment showed him in later years the tremendous results which might be accomplished under antiseptic surgery, and he became one of the first advocates, although, had he been disposed, he could have retarded terribly this innovation in surgery. In this faculty he differed from many of the authorities in other branches of scientific work. Dr. Agnew was not only an accomplished surgeon in its general branches, but he was a specialist on diseases of the eye, on diseases of women, and other branches which are now held entirely by men who do no other work. He was possessed of a profound knowledge of anatomy. His wonderful skill and ease in operating was due somewhat to this preliminary training in anatomical teaching. While he was a most brilliant operator, he always conscientiously avoided brilliant surgery, unless the patient's interests demanded it fully. He had no sympathy with operators who operated simply for their own fame. Sympathetic and gentle to an extraordinary degree, he formed the ideal conception of what a physician should be. Years of experience and training did not harden him to the necessities and desires of his humblest patient. As an operator, he will long be remembered for his consummate skill and heroic boldness, unmarred by rashness, and by his exquisite sensibility to the pain of his patient. There was a magnetism about the personality of Dr. Agnew which made all who came in contact with him his warmest

personal friends. In appearance he was imposing, being over six feet in height, his manner was gracious, kind and courtly, and he lived to become what his character and career deserved, the greatest surgeon America has produced." Dr. John Ashhurst writes that while Dr. Agnew necessarily gave a great deal of time to hospital work, he conducted a very large private practice, and during the last twenty years probably saw more patients in his office and in consultation than have ever been seen by any other Philadelphia surgeon. When it is remembered that he was at the same time constantly engaged in teaching, and during the winter months lecturing four or five times every week, it will be seen that he could only have accomplished this amount of work by carefully allotting his time, and by being blessed as he was with an unusual degree of physical endurance, enabling him to disregard fatigue by which another man would have been completely exhausted. Indeed it was for years Dr. Agnew's habit to take a train, after a full day's work, in order to see a distant patient in consultation, making his visit late at night or in the very early morning, and returning in time to be in his office as usual the next day, and to fill his lecture engagements at the university. Again referring to this noted man, the writer last mentioned says: "So modest and unassuming was he throughout his life that his real greatness was sometimes overlooked. He was possessed of great natural ability and strong common sense, and these traits would have given him eminence in whatever vocation he might have followed: had he continued in business, he would ultimately have become a great and far-seeing financier; had he turned to legal pursuits, he would have been a judge on the bench, learned in the law, or, drifting into political life, a senator; had he been a theologian, he would have been a Moderator of Assembly, or in other church relations would have graced an Episcopal chair. In his own profession Dr. Agnew was successful in every branch of practice and had he not been led to devote his energies mainly to general surgery he would have been a great physician or a brilliant specialist. Indeed he was an excellent general practitioner—not proficient, of course, in all the modern refinements of minute pathology, and differential diagnosis, for after all there are but twenty-four hours in a day, and a man has but two hands and two eyes and his were busy all the time in other work—but a safe and judicious physician, who could, and did, conduct many cases of severe and dangerous illness to a successful termination. As a surgeon he was fearless, yet conservative, not shrinking from any operation, however hazardous, but never eager to operate, and always glad if he could see a way to cure the patient by bloodless methods. In regard to advising operations he was noted for his honesty and candor. As an operator he was skillful, rapid and successful, and was in the true sense of the term "ambidextrous." He was especially skillful in all operative procedures requiring great delicacy of touch—such as the removal of thin-walled cysts—in which his long habit of anatomical dissection came particularly into play. Known pre-eminently as a general surgeon, he had large experience and great success in several special departments of his art. Witness his brilliant operations for

vesico-vaginal fistula and for ruptured perineum, in the domain of gynecology; his great skill in the treatment of vesical calculus by both the cutting and the crushing methods; and his unrivalled experience in mammary cancer. He was, besides, skillful in abdominal work, no mean ophthalmologist and was successful in orthopedic practice." As a consultant he always scrupulously guarded the reputation of the attending physician, happily accomplishing the frequently difficult task of being perfectly loyal to the doctor, while being also loyal to the interest of the patient. He especially excelled in demonstrative teaching, but whatever his theme, his audience at once perceived that he was not merely rehearsing to them a lesson which he had himself just learned for the occasion, but that he was laying before them the results of practical acquaintance with his subject in all its bearings. As a writer his fame will chiefly rest upon his "Principles and Practice of Surgery." Referring to this work, Dr. Ashhurst says: "Theories change, new doctrines become old, and most medical books, even the most successful, have a lifetime which rarely exceeds in duration that of their authors, but it is safe to say that surgical writers in future ages will still turn to 'Agnew's Surgery,' as a rich storehouse of clinical facts and personal observation just as they do now to the writings of Paré or Chelius, and as pathologists do to the works of Morgagni or Rokitsanski. His share in the surgical history of his time was such a large one that it is hard to imagine what that history would have been without it. Our fair city has had ere now in her professional ranks great operators, such as Barton and Pancoast; great writers and teachers, such as Gibson and Gross; and great consultants, such as Physick and Norris, who by their strong personalities established the traditions of surgical practice in their day and generation; but as consultant, teacher and operator combined, the name of Agnew will long be spoken as that of the type and glory of Philadelphia surgeons." Dr. S. Weir Mitchell, in a letter to one of the daily papers of Philadelphia, so admirably sums up the salient points of the life history and personal character of Dr. Agnew, that it may be reproduced here as a memorial of one who both "served his generation well" and "bore without reproach the grand old name of gentleman." Addressing the *Public Ledger*, Dr. Mitchell, says: "When a man as remarkable as Agnew dies there are a few brief days during which the lay public takes interest in the qualities of his purely professional life. Then his remembrance lives on in tender forms for those who loved him, and in technical shape, by what he wrote, survives in the gathering annals of his profession. Before, as time goes on, the natural interest of men in the details of a notable life becomes less, I should like, with your leave, to say certain things of Agnew which it greatly delights me to be able to say of one of the masters of my guild. Amidst all that men have yet said of him, these have not been said—nor are they likely to be, except by physicians who know—ah, very well know—the true qualities of their rank and file, and are deceived by none of the pretences and shams which now and then win from the public a false estimate of this man or that, and set him, for a time, on dangerous levels of apparent competence. For methods

which won this sort of success Agnew had a gentle contempt. He once said to me that it distressed him to be spoken of in the daily papers, and, with the nearest approach to sarcasm I ever heard from him, added: "I don't have a great esteem for newspaper doctors." He owed nothing to such means here alluded to. His upward progress was due to the most earnest use of every energy in the doing of whatever he had to do. For him, to do a thing well was to satisfy his sense of duty as nothing else could, and moreover, work was his only play—strange paradox! He rejoiced in this use of himself. To be long away from work wearied him, so that there went to the perfecting of his every day business—duty and the pleasure which others get out of holidays. I do not say that this combination which makes true play of mind or body a thing impossible is a quite desirable result. The body which can endure it and live to age must be of sturdy make. When he and I were in our early days—of ill-repaid work, he taught anatomy to crowded classes in a building where I had my laboratory. I then saw much of the tall, strong man, out of whose perfect anatomical knowledge began to come the quickly trusted skill of the surgeon. This is a natural way to surgical success. It came by slow degrees—and at last clinical position, and, later, the Barton Chair of Surgery. Then a vast and overflowing practice followed. There was nothing abrupt or startling in this success. It was a normal growth, and due in great measure to the esteem and confidence with which his own profession learned gradually to repose upon his surgical judgment. He was a *doctor's doctor*, and that means a great deal to us who see ourselves from the side scenes and amid the grim sincerities of the consultation. As I watched his career, it seemed to me he owed our unbounded trust not to his intellect, which was not highly origination or fitted for profound research, but to singular balance of mental and moral qualifications. Novelties neither too much tempted nor too much repelled him. He was intellectually very honest. The surgeon is sometimes apt to become dramatic, to like display of his own skill. Agnew had none of this. Neither caution before a decision, nor cool courage in surgical action, was ever wanting. The presiding mind was strong rather than subtle, and was capable of swift action in emergencies. I never knew a man who seemed to me to live his professional life on higher levels of that common sense which in its perfection is so uncommon. He seemed to me also to get out of his mental and moral machinery all that was possible in life, and how rare is this? Nature had made him ambidextrous, and the kindly grave face and the gentle pity of his ways with the sick or hurt was a pleasant thing to watch. For behind this quiet and instinctive tenderness was a real kindliness of heart—a great good will to men, an unbroken sweetness of temper. To know what that gift or that conquest means a man must have been a physician. He had it, and, too, a calm delight in his power to help. He once said to me, "that sometimes the immense amount of unpaid service to physicians and their families was hard on too busy people." But then he added, "It is, after all, a great help to oneself. We ought to be thankful we are not always making mere money." Of the exact words I can not be sure. Of the sense I am. I have

seen many men change almost radically as life went on. Agnew was from first to last, young or old, with small means or easy competence, the same man. He held resolutely by his Christian creed and took it with him into life. A certain simplicity was in all his ways. The outcome of act from belief was fearless and unquestioning. He believed, as I do, that a clinical class of men and women is disgusting. He thought it wrong and sacrificed to his belief the coveted surgeony of the Pennsylvania Hospital—resigning at once rather than obey the order of the managers. The country saw what manner of man was this when Garfield was shot. Agnew looked on the call to the President as a duty to which all other duties and all other interests must yield. It was a nation's call which he obeyed. For three summer months he spent nearly all of his time in Washington or at Elberon. His bulletins were simple. He kept the inevitable reporting cormorant at bay. The storm of impertinent criticism, lay or medical, honest or unscrupulous self-parade, disturbed him not. He did his duty and made no answers. Meanwhile his consultation room was closed, his operations ceased, his income fell to nothing. The inevitable result came, and the President died. Agnew declined to send in an account and tranquilly accepted from Congress an honorarium such as is common enough to receive for a single large operation done in any distant city. This pitiful expression of a nation's gratitude, to appearance, troubled Agnew as little as any minor annoyance might have done. So long as the creditors Conscience and Duty were paid in full he was in no wise greatly concerned. What he won in life was the just reward of fine faculties of mind, unending energy and general loveliness of nature, which in all his forms of useful activity secured for him the utmost affection. There was no luck in this sturdy, unrepenting life. Fortune did nothing for him. In the noble words of one of our own home poets, whom we have not yet learned to know, he might at any time have said to the fickle dame:

"I am not poor enough for thy reward,
Honor and splendor in my heart abide,
I want thee not, save that thou kneel, and so
Proffer thy service as cup-bearers do."

Fortune bent down to him, not he to her, and therefore it is that his profession so much reveres his memory—thankful less for its intellectual product than for the beautiful illustration of how noble a thing the life of a great surgeon may be. Dr. Agnew left a widow, but no children. The total amount of his estate was estimated at \$100,000. He left a legacy of \$50,000 to the Hospital of the University of Pennsylvania, \$1,000 to the College of Physicians, and made a number of other public charitable institutions his beneficiaries.

ALEXANDER, Eli Marion, of Ripley, Miss., was born in Monroe county, that State, December 20, 1830. He studied medicine in the medical department of the University of Louisville and in the Jefferson Medical College, Philadelphia, and was graduated M. D. from the last named institution in 1859. He established himself in active general practice of medicine at Ripley until the outbreak of the civil war. During the rebellion he held the position of Medical Director of the 5th division of the Mississippi Militia, with the

rank of lieutenant-colonel, and also that of lieutenant in the 2d Regiment of the Mississippi State troops. Failing health compelled his resignation from the Confederate army, and finally after a few years to also abandon his civil practice. In 1871 he represented Tippah county in the Mississippi Legislature, and was also elected to the State Senate and served in this capacity for two years. He then became connected with the Ship Island, Ripley and Kentucky Railroad.

ALLEN, Peter Dudley, of Cleveland, Ohio, was born in Kinsman, Trumbull county, that State, March 25, 1852. He graduated from Oberlin College in 1875. In 1879 he graduated from the medical department of Harvard University, and served the following year as house surgeon in the Massachusetts General Hospital of Boston. The three succeeding years were spent in further study in Europe, with part of a winter on returning from Europe in New York and Philadelphia. In 1883 he began practice in Cleveland, Ohio, where he has remained since that time. He is visiting surgeon to Lakeside Hospital and Charity Hospital, both of Cleveland, and practices exclusively surgery.

ALLEN, Ezra P., of Athens, Pa., whose ancestors came to this country in 1639, was born in Smithfield, Pa., June 5, 1821. After receiving an academic education he studied medicine in Woodstock at the Vermont Medical College, and was graduated M. D. at the Berkshire Medical College, at Pittsfield, Mass., in 1847. He also studied special branches in medicine under Dr. B. R. Palmer, of Woodstock, Vt., and Prof. Alonzo Clark, of New York, and supplemented his medical acquisitions at a later date by courses of lectures at the College of Physicians and Surgeons of New York and at the University of Pennsylvania. He first established himself at Bradford, and then at Smithfield, Pa., the place of his birth. Here he remained until the outbreak of the civil war, when (in 1862) he entered the military service as Assistant Surgeon of the 141st Pennsylvania Volunteers, but during the same year he was made Surgeon of the 83d Pennsylvania Volunteers. In 1863, however, he was compelled to resign on account of ill health. He then settled in the town of his present residence and engaged in the practice of his profession, but giving especial attention to the practice of surgery, and has operated successfully in many capital cases, such as amputation twice at hip joint and ligation of the femoral artery. He has been twice president of his County Medical Society, and in 1866 was vice-president of the Pennsylvania State Medical Society. He is also a member of the American Medical Association and of numerous other medical and scientific organizations. His contributions to medical literature and science have been of interest and importance, among which may be mentioned, papers entitled, "Do We Suffer When Dying, or, Is Death a Painful Process?" and "Mammoth and Mastodon and the Age in Which They Lived." From 1864 to 1872 he was Professor of Materia Medica and Midwifery in the Geneva Medical College.

ALLEN, Harrison, of Philadelphia, Pa., was born in that city, April 17, 1841. He was graduated at the Medical School of the University of Pennsylvania in 1861. In 1862 he was commissioned assistant surgeon in the United States army and served with the army of the

Potomac until March, 1863, when he was transferred to hospital duty at Washington, where he remained until his resignation in December, 1865, having attained the brevet rank of major. From 1865 to 1884 he was Professor of Comparative Anatomy and Medical Zoölogy in the University of Pennsylvania. Dr. Allen then resigned the position to fill the chair of physiology. Since then this professorship has been held by Edward J. Reichert. In 1867 the subject of this sketch was elected Professor of Anatomy and Surgery in the Philadelphia Dental College and in 1870, Surgeon to the Philadelphia Hospital and secretary of the Medical Board. He is a member of numerous medical societies and was a delegate from the Centennial Commission to the International Medical Congress. His contributions to the various medical journals relate chiefly to osteomyelitis, human anatomy and morbid anatomy. He has published "Outlines of Comparative Anatomy and Medical Zoölogy," 1867, second edition, 1877; "Studies in the Facial Region," 1874, second edition, 1882; "An Analysis of the Life Form in Art," 1875; and "A System of Human Anatomy, including its Medical and Surgical Relations." The last work contains an introductory chapter on Histology, by E. O. Shakespeare and numerous lithographic plates and wood cuts. This publication is considered one of unusual professional value.

ALLEN, Jonathan Adams, of Chicago, Ill., was born in Middlebury, Vt., January 16, 1825, and died at his residence August 15, 1890. On his father's side he was descended from Welsh and Saxon ancestry (1634), and on his mother's he came from "Mayflower" stock (1620). The academic education of Dr. Allen was received at Middlebury College, Vermont, and he received his medical education at Castleton Medical College in that State. He graduated in 1846, and settled in Kalamazoo, Michigan. In January, 1847, he married Miss Mary Marsh of that city, and the succeeding day visited his first patient. Since this time the results of Dr. Allen's life would be a narration of the achievements of the highest honor in his profession, of a life of unwearied application, of indomitable perseverance, and of persistent instruction. He resided at Kalamazoo and Ann Arbor, Michigan, twelve years, and in 1858 was elected President of the Michigan State Medical Society. In 1859 he removed to Chicago, where he continued his active professional career the rest of his life. He contested the priority of teaching the mechanism of nervous action with the celebrated Dr. Marshall Hall, of England, and Dr. Henry F. Campbell of Georgia, and has given special attention to the subject of medical jurisprudence, particularly to that part of it involving questions of insanity or mental capacity. His contributions to medical literature consist of: "Essays on Mechanism of Nervous Action," published in 1858; "Medical Examination for Life Insurance." Of this work nearly 50,000 copies have been sold, and it is considered a standard work among life insurance companies. It has also been translated and published in Germany. He has also furnished a large number of articles of professional interest to medical journals, and was for many years editor of the *Chicago Medical Journal*. Under the administration of James Buchanan he was made receiver of public moneys for Michigan. In February, 1848, Dr. Allen

was appointed Professor of Materia Medica, Therapeutics and Medical Jurisprudence in the Indiana Medical College at Laporte in that State, and in 1850 he was elected Professor of Physiology and Pathology in the medical department of the University of Michigan. In 1859 he accepted the chair of Professor of Theory and Practice of Medicine in the Rush Medical College, when he established himself at Chicago, and held this position until 1890, or until impaired health compelled him to resign. When the editor of this work attended his first course of lectures at this institution, in 1863, Professor Allen had already obtained a national reputation as a teacher, and greatly impressed him with his fine personal address, his genial disposition and brilliant wit. He was exceeding popular with his classes. His lectures were eminently practical, and

J. Adams Allen.

as is well known always well attended. As a result of his extended studies and varied investigations the students of Rush Medical College esteemed him as the "versatile uncle," a title by which he was familiarly known to the students and alumni of the college for many years. Such was his happy faculty of imparting instruction, that his didactic discourses always remained in their memory. He was elected among the earliest members of the American Medical Association and was a member of the Illinois State Medical Society as well as of a number of other medical organizations. It may be said that every study that Dr. Allen has undertaken has been beautified by his eloquence and literary talent; in every phase of existence wherein he has lived, he has been honored and esteemed as few men are. President of Rush Medical College,

Grand Master of the Masons of Michigan, Grand Commander of Knights Templar, Honorary of the Thirty-Third Scottish Rite, Northern Jurisdiction, the chosen orator on occasions of celebration, successful editor and correspondent, his works live after him and will endure. Dr. Allen had been surgeon for the Chicago, Burlington and Quincy Railway for twenty-four years. He had, in his travels, gained a fund of knowledge which he treasured up in a series of journals which, if published in full, would fill several octavo volumes. He has made the tour of Europe, Egypt and Morocco, and some few of his notes of travel have been published. The excellent portrait which accompanies this sketch is from a photograph of Dr. Allen shortly before his death and will no doubt be highly prized by all who have derived instruction or formed the pleasant acquaintance of this eminent teacher and physician whose active professional career has extended over a period of forty years.

ALLEN, Joshua G., of Philadelphia, Pa., was born in Delaware county, that State, April 23, 1832. His maternal ancestors were English Quakers who emigrated to this country with William Penn, his father's ancestors being of the same stock with an intermingling of Huguenot. Having received an academic education at the Quaker School, at West Town, Pa., he matriculated in the University of Pennsylvania, receiving therefrom the degree of M. D. in 1856. Soon after he was graduated he located in Philadelphia, where he has succeeded in gaining a large practice, particularly in his specialty of obstetrics and diseases of women. In a case of utter prostration from menorrhagia combined with malarial poisoning, he performed the first successful operation in this country for transfusion of blood. (See Medical and Surgical Reporter, 1869.) He has subsequently performed the operation several times with marked success. In two instances he was successful in treating extra-uterine pregnancy by the galvanic battery, which has been reported in the proceedings of the Philadelphia Obstetrical Society (1872). He is one of the original members of the Philadelphia Obstetrical Society. In 1861 he was selected as one of the principal physicians and lectures in the Philadelphia Lying-in, Charity and Nurse School, and has been connected with that institution for many years. He has been very successful as a lecturer upon obstetrics, diseases of women and nurse training, being able to gather the largest classes of medical students ever known outside of the regular college courses, with the exception of a few in dissection and surgical anatomy formed by the late Dr. Agnew.

ALLEN, Nathan, of Lowell, Mass., was born in Princeton, that State, April 25, 1813, and died in the former city January 1, 1889. He was graduated at Amherst College in 1836, and at the Pennsylvania Medical School in 1841, and began the practice of medicine in Lowell, where he resided for about fifty years. He was elected a trustee of Amherst College in 1856, and aided largely in establishing the department of physical culture in that institution. In 1864 he was appointed a member of the Massachusetts State Board of Charities; served by successive re-appointment till 1880; was frequently chairman and in 1872 was appointed delegate to the international congress that met in London and

discussed reforms in correctional institutions. His published works include "The Opium Trade," "Important Medical Problems," "State Medicine and Insanity," "Normal Standard of Women for Propagation" and "Physical Development."

ALLEN, Thomas Jefferson, of Shreveport, La., was born in Hanover City, Va., December 13, 1830. His ancestors were English. In his early childhood his parents moved from Virginia to the western district of Tennessee, Haywood City. Here the subject of this sketch was reared, and in the Brownsville Academy received his academic education. About the age of twenty-one he began the study of medicine in the office of Dr. John R. Allen, an older brother. When his two years of pupilage were over, he went to Philadelphia and spent two years.

Josh Allen

While there he availed himself of every advantage afforded by the hospitals and clinics of that city, and received the degree of M. D. from Jefferson Medical College in 1855. In the spring of this year he located in Shreveport, La., and in 1857 married Mrs. Catherine M. Morris, of that city; two sons and a daughter were the result of this union, his eldest son, Dr. Jno. Walter, now surgeon in charge of the Shreveport Charity Hospital, shares with him the labors of a large and lucrative practice in medicine and surgery. Dr. Allen passed through the epidemics of yellow fever that visited Shreveport in 1867 and 1873. The latter proved so terrific that it called forth the sympathetic aid of nearly every State in the Union. Having established a private infirmary in 1872, this institution afforded the Doctor unusual opportunities for the study of

this malignant disease. The infirmary is still conducted by him and his two sons, Jno. Walter and T. Mutter Allen. The subject of this sketch is a member of numerous scientific organizations and of the Americal Medical Association and the Louisiana State Medical Society. He has been thrice honored as president of the Shreveport Medical Society, was president of Caddo Parrish Medical Society, vice-president of the Louisiana State Medical Society and was a member of the Council of the Section on Medical Climatology and Demography of the Ninth International Medical Congress, Washington, D. C.

ALLEN, Wesley, of West Newton, Indiana, was born in that vicinity March 26, 1836. His parents, Joseph and Elizabeth Allen, emigrated from Virginia in 1823, settling among the Indians. His early education was obtained in the common schools and at Friends' Board-

Wesley Allen,

ing School, now Earlham College, at Richmond, Indiana. His preceptor was Dr. Jesse Reagan, with whom he read medicine nearly three years. When the civil war commenced Dr. Reagan went into the army and young Allen was left no choice but to take his place. He learned in the school of experience, and by close observation and study he has had marked success in general practice, especially in typhoid fever and pulmonary diseases, and has never lost a woman in eight hundred cases of obstetric practice. In the great epidemic of spotted fever the winter of 1863 and 1864 ten deaths took place uncomfortably close together, each one dying in from eight to thirty-six hours from commencement of the attack. The treatment of cases reported in medical journals consisted in the use of quinine, iron, strychnine and whisky, most of the patients, however, dying promptly. Taking advantage of this result, Dr. Allen used anodynes

heroically with active cathartics, never losing a case that lived three days. Some cases would lie from three to six weeks unconscious and frequently have convulsions, but would make complete recoveries, proving the fallacy of the theory held by many of the profession that epidemic cerebro-spinal meningitis demanded an active stimulating treatment. The use of large doses of opium and active cathartics was soon after advocated by Dr. Stille and other eminent physicians, but due credit should be given the subject of this sketch for being among the first to inaugurate the most successful plan of treating this terrible malady. Dr. Allen was graduated at the Indiana Medical College in 1873, and has been engaged in the active duties of general practice for nearly a third of a century. He is an honored member of the Marion County and Indiana State Medical Societies.

ALLPORT, Frank, of Minneapolis, Minn., was born in Watertown, N. Y., February 22, 1855. His family settled in Chicago in the same year. He was educated at Racine College, Racine, Wis., and at the Chicago University. His medical education was obtained at the Chicago Medical College, the Long Island College Hospital and the University at Heidelberg, Germany. He spent two years in Heidelberg alone, while pursuing his professional studies. He graduated at the Chicago Medical College in 1876. The early years of his medical practice were spent at Sycamore, Ill., but in 1882 he moved to Minneapolis, Minn., which has ever since been his home. He makes an exclusive specialty of diseases of the eye and ear, and occupies the chair of Clinical Ophthalmology and Otology in the University of Minnesota, and is one of the founders of the University Free Dispensary. He is the oculist and aurist to St. Barnabas' Hospital, the Northwestern Hospital, the Methodist Hospital and the Sisters' Hospital, and to the Catholic Orphan Asylum, Bethany Home and to the Children's and Old Ladies' Home and for numerous railroads. He has written much upon subjects appertaining to his specialties, but his principal work has been in the direction of mastoid diseases and brain diseases following therefrom. His Mastoid Speculum for facilitating mastoid operations is now used the world over. He was married in Sycamore, Ill., to Katherine Ann Elwood, daughter of Hon. Reuben Ellwood, of that city. They have no children.

AMORY, Robert, of Boston, Mass., was born in that city, May 2, 1842. He is a descendant of Governor James Sullivan, of Massachusetts. His academic education was received at private schools and at Harvard College, whence he received the degree of A. B. in 1863, and after attending the medical department of the same college he received that of M. D. in 1866. His medical education and training was supplemented by a year's study at Paris and Dublin, and in the autumn of 1867 he settled at Brookline, Mass. He has been connected with the educational affairs of this city. In 1869 he was appointed lecturer for that year on the physiological action of drugs at Harvard College, and was afterward Professor of Physiology in Bowdoin College, from which position he resigned in 1874. He has been an active member of several medical societies. He is the author of papers on the "Action of Nitrous Oxide," on "Bromides of Potassium and Amonium," "Chloralhydrate,

Experiments Disproving Evolution of Chloroform in the Organism," "Pathological Action of Prussic Acid" and on "Poisons." He also edited and translated "Lectures on Physiology," by Prof. Rüss, of Strasburg University Medical School, contributions on "Photographs of the Spectrum," were also published from his pen, in the proceedings of the American Academy. In 1875 he was appointed Assistant Surgeon in the Massachusetts Volunteer Militia, and Surgeon and Medical Director with the rank of Lieutenant-Colonel in the 1st Brigade, 1876. He has also served as a member and secretary of the Brookline Board of Health. But has of late years been a resident of the city of Boston.

ANDREWS, Edmund, of Chicago, Ill., was born April 22d, 1824. He received his education at the University of Michigan, from which he graduated A. B. in 1849, and A. M. and M. D. in 1852. His first location was in Ann Arbor, Mich., at which place he remained till 1856, when he removed to Chicago, the place of his present residence. He was appointed Demonstrator of Anatomy and Professor of Comparative Anatomy in the University of Michigan, afterwards Demonstrator of Anatomy in the Rush Medical College, Chicago, and subsequently Professor of Principles and Practices of Surgery and of Clinical and Military Surgery in the Chicago Medical College, and served since 1859 as surgeon of the Mercy Hospital. He is a member of the American Medical Association, of the American Association for the Advancement of Science, of the Michigan State Medical Society, of the Illinois State Medical Society, Chicago Academy of Sciences, Wisconsin Academy of Sciences, and the Chicago Medical Society. He has contributed many articles to various medical journals, principally on statistical surgery, orthopedic surgery, and operative surgery. He gathered and published statistics showing the failure of the system of licensed prostitution, and collected and published statistics of 92,815 cases of anæsthesia by ether, and of 117,078 cases by chloroform, showing the relative risk of the use of chloroform and ether. Beside these he founded and conducted for three years the *Peninsular Medical Journal*. During the war he occupied the position of surgeon of the 1st Regiment Illinois Light Artillery. He assisted in founding the Chicago Academy of Sciences, and acted as its president for several terms, and was also one of the founders of the Chicago Medical College, and trustee of the Northwestern University. He has recently published a valuable work on "Rectal and Anal Surgery," which has met with a wide circulation and done much in removing this line of practice from the domain of "quackery." Dr. Andrews has been a leading surgeon of Chicago many years and is still noted for his unabated interest in professional pursuits.

ANDERSON, Edwin A., of Wilmington, N. C., was born in that city June 17, 1816. His father, who was a Scotch landed gentleman, came to this country at the solicitation of General Washington, and until the death of the latter had charge as steward and superintendent of his estates at Mt. Vernon. His mother's father, Thomas Howard, was a colonel in the revolutionary war. The subject of this sketch was educated at Yale College, both in the academical and medical departments of that institution, graduating from the former in 1835,

and from the latter in 1837. He settled in Wilmington and turned his attention especially to ophthalmic surgery. He was president of the Hanover County Medical Society and of the North Carolina State Medical Society in 1870. He has contributed several articles on medical subjects to various journals, among which may be mentioned "Lead Poisoning and Rattle Snake Bites," "Gelsemium Semper Virens," "The Diuretic Properties of the Vaccinium-Repens" and the "History of Yellow Fever in Wilmington, N. C., in 1862." During the rebellion he held the position of surgeon in the Confederate State army, and was medical director of the North Carolina Life Insurance Company many years. In 1842 he married the granddaughter of Major-General Alexander Lillington, the hero of Moore's Creek Battle, in 1776, near Wilmington, N. C., the next great battle after Lexington, and the most important of the war of our independence. Dr. Anderson is among the oldest medical men in his State and has been actively engaged in professional pursuits for more than fifty years.

ANDERSON, Turner, of Louisville, Ky., was born in Mead county, that State, August 11, 1842. He was graduated M. D. at the Cincinnati College of Medicine and Surgery in 1863, and located in the city of his present residence. During the rebellion he was Surgeon of the Twenty-Eighth Kentucky Volunteers (Union Veterans). He is a member of several medical societies in his city and State, and was vice-president of the Kentucky State Medical Society in 1874, and during the same year he was president of the College of Physicians and Surgeons of Louisville. Dr. Anderson is one of the leading medical men of his city and has had thirty years experience in the practice of his profession.

ANDERSON, William, of Indiana, Pa., was born June 6, 1825, in Green township, Indiana county, Pa. His parents emigrated to this country from the north of Ireland in 1817, and settled on a farm in the eastern part of his native county, where he passed his early life working with his father on the farm, and attending at intervals the district schools, in which he acquired a good common education, fitting him for a higher course of instruction, which he entered upon at the Blairsville Academy. After finishing a thorough course at that school and at a classical academy, he began the study of medicine. After two years of close office study with Dr. James M. Taylor, he entered the Jefferson Medical College, Philadelphia, returning the following year, and graduating March 6, 1852, attending, however, a third course of lectures at his *Alma Mater*, in 1868-69. On graduating he settled in Indiana, Pa., where he has remained to the present time. His practice is general, including medicine, surgery and obstetrics. He has been a member of the Indiana County Medical Society since its organization in 1858, and was its first secretary, its second president and has filled in turn all the offices in the society, besides representing it at different times in the medical society of the State of Pennsylvania and in the American Medical Association. He has been a permanent member of the State society since 1862, was one of the vice-presidents in 1864, and the president of the State society in 1865. Since 1868 he has been a permanent member of the American Medical Association,

and was a member of the International Medical Congress that met at Philadelphia in September, 1876, and also member of the same congress that met in Washington, D. C., September, 1887. He has held no civil office, except, that of school director and town councilor in the borough of Indiana. His contributions to medical literature comprise brief biographical

William Anderson.

sketches of the medical profession of Indiana county, Pa., and essays or papers on "Sclerosis of the Nerve Centers," "Pyemia," "Nervous Diseases," "Bacteria," "Tobacco" and "Hygiene." Dr. Anderson was married April 12, 1855, to Jane McCrackin, of Indiana, and has one daughter.

ARCHER, John, was born in Harford county, Maryland, June 6, 1741, and died there in 1810. "He was graduated at Princeton in 1760 and studied theology, but relinquished this on account of a throat trouble, and after studying medicine, received in 1768, from the Philadelphia Medical College, the first medical diploma issued on this continent. He raised and commanded a military company at the beginning of the revolution, was for several years a member of the legislature, and was chosen presidential elector in 1801. From 1801 to 1807 he was a member of Congress from Maryland. He made several discoveries in medicine which have been adopted by the profession." His son (Stevenson Archer), a member of Congress and an eminent jurist, was appointed Chief Justice in 1845 and held the office until his death.

ARMSTRONG, Leroy Grant, of Boscobel, Wis., was born at Cortlandville, N. Y., March 7, 1834. He is of Irish descent but his ancestors were among the earliest settlers of New York. He received his academic education at the State University of Wisconsin and studied medicine at the Rush Medical College, Chicago, from which he was graduated in 1858. His medical education was supplemented by attending the College of Physicians and Surgeons in New York in 1873-4. He first prac-

ticed his profession at Palmyra and Fennimore, Wisconsin, but in 1862 he entered the army. After the close of the civil war he established himself at Boscobel, where he has been located since 1866. He is a member of numerous medical societies and was vice-president of the Wisconsin State Medical Society in 1875. He is the author of essays on "Puerperal Fever," upon "The Proper Management of Women at Confinement" and on "The Unity of Disease," all of which have been published in the transactions of the Wisconsin State Medical Society. During the civil war he was surgeon of the 6th and the 48th Wisconsin Volunteers and was also surgeon in charge of the military hospital at Fort Scott and that of Fort Larned, Kansas, and remained in the latter position for nearly a year after the close of the war. Dr. Armstrong is one of the leading medical men of his State, and has had thirty-five years experience in the practice of his profession.

ARMSTRONG, William S., of Atlanta, Ga., was born in that State October 9, 1838. He was graduated M. D. at the University of the City of New York, Medical Department (University Medical College), in 1859. He is Professor of Anatomy and Clinical Surgery in the Atlanta Medical College, surgeon to the Grady Hospital, member of the Atlanta Society of Medicine, Medical Society of the State of Georgia and the American Medical Association. He is also president of the Board of Health of Atlanta and is regarded as one of the leading medical men of that city. Dr. Armstrong served as assistant surgeon in the Confederate army during the war.

ARNOLD, Abraham B., of Baltimore, Md., was born in Würtemberg, February 4, 1820. Having received an academic education at Mercersburg, Pa., he began the study of medicine under Dr. R. Lehwers, of New York, attended his first course of lectures in the medical department of the University of Pennsylvania, his second course in the medical department of Washington University, Baltimore, and from the last named institution received his degree of M. D. in 1848. Dr. Arnold has been established in the practice of his profession in Baltimore for nearly a half century and is one of the oldest physicians of that city. He has devoted special attention to diseases of the nervous system. He was chosen Professor of the Principles and Practice of Medicine in Washington University in 1872. In 1877 he was elected to the chair of Clinical Medicine in the College of Physicians and Surgeons of Baltimore. He has been Consulting Physician to the Jewish Hospital and in 1877 was president of the Academy of Medicine of Baltimore. He is a member of the Medical and Chirurgical Faculty of Maryland, and has published many papers of medical interest in the leading journals of his profession.

ASHHURST, John, of Philadelphia, Pa., was born in that city, August 23, 1839. He was educated at the University of Pennsylvania and pursued his medical studies in the medical department of that institution, graduating A. B. in 1857, and A. M. and M. D. in 1860. In the same year he was elected a member of the Academy of Sciences of Philadelphia. In 1861 he was elected a member of the Pathological Society of that city, and was elected president of this organization in 1870 and 1871. He has also been a member of the College of Physi-

cians since 1863. He served three years as Acting Assistant Surgeon United States Army during the rebellion. He was elected Surgeon to the Episcopal Hospital in 1863 and was also elected Surgeon to the Children's Hospital in 1870. He has made valuable contributions to the literature of his profession, among the most important of his works in book form may be mentioned, "Injuries to the Spine," issued in 1867; and "Principles and Practice of Surgery," 1871, second edition in 1885. In 1877 he was elected Professor of Clinical Surgery in the University of Pennsylvania, and he is at this (1893) date, Professor of Surgery and Clinical Surgery in the same institution. Dr. Ashhurst's experience in general surgery extends over a period of a third of a century. He is widely known as a writer and clinician. As a teacher in his branch of the profession he is a recognized authority. His skill as an operator is perhaps unsurpassed by that of any other living surgeon in this country.

ASHTON, Lawrence, of Dallas, Texas, was born in King George county, Virginia, in the year 1847. His father, Dr. Horace D. Ashton, is an eminent physician of that section. He received a liberal education, and under his father was thoroughly tutored and trained in the art of diagnosis and the application of therapeutic remedies, this ripe physician and scholar giving him the advantage of an extended experience covering many years. He attended the National College of the Columbian University, Washington, D. C., graduating in 1872. After two years' practice with his father he located in Falmouth, Virginia. He was married January 29, 1878, to Nannie, youngest daughter of Captain Duff Green, of the latter town. Dr. Ashton was elected member of the State Medical Society in 1875, and member of the American Medical Association in 1881. His medical education was supplemented by attending the University of the City of New York, again graduating in 1885. He was vice-president of his State society for years, and member of the executive committee. When Virginia passed a law to regulate the practice of medicine the State society requested the Governor to appoint Dr. Ashton one of the examiners under that law, which position he held until he resigned to move to Dallas, Texas, in 1890. He has contributed largely to current medical literature, chief of which was a treatise on "Puerperal Septicæmia," in 1886. He has always enjoyed an extensive practice, is a keen observer, and is quick of perception and decision. He was unanimously elected honorary Fellow of Virginia Medical Association in 1890.

ATKINSON, Archibald, of Baltimore, Md., was born in Smithfield, Va., February 23, 1832. He pursued his professional studies at the University of Virginia and the University of Pennsylvania and was graduated at the latter institution in 1854. His medical education and training were supplemented by attendance at the Dublin Rotunda Hospital and the University of Paris. He has been established in Baltimore about twenty years and is a member of the Baltimore Medical Association and the Maryland Medico-Chirurgical Faculty. He served four years in the Confederate army as regimental and brigade surgeon and has served many years as Professor of Materia Medica and Therapeutics in the Baltimore College of Physicians and Surgeons.

ATKINSON, William Biddle, of Philadel-

phia, Pa., the son of Isaac S. and Mary R. (Biddle) Atkinson, was born in Haverford, Delaware county, Pa., June 21, 1832. His paternal ancestry were of the earliest settlers of New Jersey. On the maternal side of his family the subject of this sketch is of German descent. Shortly after his birth, the parents of Dr. Atkinson removed to Philadelphia, where he was educated, receiving in 1850 from the Central High School the degree of A. B. and that of A. M. in 1855. After a three years term of study at the Jefferson Medical College under the preceptorship of Dr. Samuel McClellan, he received in 1853 the degree of M. D. For several years after his graduation he occupied a portion of each day in teaching the classics and mathematics. In 1854 he was elected to membership in the Philadelphia County Medical Society, the proceedings of which he reported for several years for medical journals and which he finally issued in book form as "Discussions before the Philadel-

W. B. Atkinson.

phia County Medical Society." For several years he acted as correspondent for the *New Jersey Medical and Surgical Reporter*, the *New York Medical Times*, the *Nashville Medical Journal*, the *New Orleans Medical Journal* and other medical periodicals. This led to his connection with Dr. S. W. Butler in 1858 as associate editor of the *Medical and Surgical Reporter*, which they shortly changed from a monthly to a weekly journal. At the close of 1859 this relation was severed, and Dr. Atkinson then assumed the position of editor of the department of obstetrics and diseases of women and children for the *North American Medico-Chirurgical Review*, then under charge of Prof. S. D. Gross. This continued until the civil war caused the publication of this journal to be discontinued. In 1857 he commenced to lecture independently on obstetrics. In 1861 he was elected to the Department of Obstetrics and Diseases of Women of the Howard Hospital, Philadelphia. In 1859 he was appointed Assistant Professor of Obstetrics and Diseases of

Women and Children in the Pennsylvania Medical College, which was then in the hands of an able faculty that attracted a large number of students. While here he conducted the gynecological clinic, at that time, and for some years, the only one in Philadelphia. His connection with this institution ceased in 1861, when the entire faculty resigned and the college became defunct. During the war he served as acting assistant surgeon. He was elected assistant secretary, then secretary of the Philadelphia County Medical Society and served in that office for seven years, when he declined a re-election, and was chosen vice-president, and president in 1873. On retiring from this office he delivered the annual address, which was published by the society, and was entitled "Hints in the Obstetric Procedure." In consequence of a great demand this was subsequently extended and published in book form, a large edition of which was soon exhausted. He became a member of the State Medical Society of Pennsylvania in 1858, and was made a member of its committee of publication, a position which he has held ever since. In 1863 the position of permanent secretary of this body was created and he was elected to that office and has been retained, and as such has edited its annual volume of transactions up to the present time. In 1859 he became a permanent member of the American Medical Association. When its laws were changed in 1864, and the post of permanent secretary was created, he was unanimously chosen to that office which he still retains, and edited its annual volume of transactions until 1883, when a weekly journal was issued instead. He is a member of the Northern Medical Association of Philadelphia, its secretary and its president. In 1874 he was selected to deliver the address on obstetrics, which was a review of the year's progress in that branch of our profession. In March, 1877, he was elected to the lectureship on diseases of children, Jefferson Medical College. In 1877 chosen Professor of Sanitary Science and Pediatrics in the Medico-Chirurgical College, Philadelphia, in which position he lectured to large classes for several terms, after which he retired from the active work and was made Honorary Professor. On the organization of the State Board of Health of Pennsylvania, his work in connection with sanitary matters brought him the offer of a Medical Inspectorship, in which position he has become well known by his reports on sanitary affairs in that State. He has long held the position of a trustee in the Philadelphia Dental College and holds a similar position in several other institutions in that city. He has made many important contributions to medical literature such as "Evidence of Life in the Newly Delivered Child," *Medical and Surgical Reporter*, 1873; reprinted in the *Dublin Hospital Gazette* and in the American supplement to the *Obstetric Journal*, Great Britain and Ireland; also articles on "Chloral in Labor," "Veratrum Viride," "Forceps in Labor." Of those in book form he has edited the "Medical Register and Directory of Philadelphia," "Physicians and Surgeons of the United States" (1878), second edition, 1880; and "Therapeutics of Gynecology and Obstetrics" (1881). Dr. Atkinson has been closely identified with our profession during the last forty years, and upon his part this period has been characterized by

unremitting industry and energy, exercised in the interest of medical progress. He has been a successful physician, journalist, author and clinical teacher. His long and faithful work not only in the medical societies of his city and State, but in the American Medical Association and the numerous positions of honor that he has been called upon to fill, amply testify to his widely known professional ability and well deserved appreciation.

ATLEE, John Light, of Lancaster, Pa., eldest son of Colonel William Pitt Atlee, a revolutionary officer, and grandson of Hon. William Augustus Atlee, was born in Lancaster, Pa., November 2, 1799, and died there October 1, 1885. After receiving his preliminary education in the schools of Lancaster, he attended one year (1813-14) at Grey and Wiley's Academy, in Philadelphia. He studied medicine with Samuel Humes, M. D., in 1815, and in April, 1820, graduated from the medical department of the University of Pennsylvania. He then began practice in Lancaster, where he remained during the rest of his life. He was active in the organization of the Lancaster City and County Medical Society, of which he was twice elected president. He was one of the originators of the State Medical Society, in 1848, became its president in 1857, and one of the organizers of the American Medical Association in Philadelphia, was elected one of the vice-presidents in 1868 and president in 1882. At the union of Franklin and Marshall Colleges he became Professor of Anatomy and Physiology, and so continued until 1869. He has always taken a lively interest in the cause of education, and having been appointed a school director in 1822, was for more than forty years an active and useful member of the board. He was a trustee of Franklin and Marshall College as well as of the Bishop Bowman Church Home, of Lancaster. He was also president of the board of trustees of the Home for Friendless Children of the city and county of Lancaster, and sustained the same relation to the State Lunatic Hospital, at Harrisburg. He has been a contributor to the *American Medical Journal*, and other periodicals. He revived the operation of ovariectomy in 1843, and was the first in the history of medicine to successfully remove both ovaries at one operation. This patient lived and remained in good health for more than forty years afterwards. He was elected honorary Fellow of the American Gynecological Society in 1877, and was trustee of numerous public institutions. He was married March 12, 1822, to Sarah H., eldest daughter of the late Hon. Walter Franklin, who was presiding judge of the courts of Lancaster and York counties.

ATLEE, Walter Franklin, Philadelphia, son of Dr. John L. Atlee, of Lancaster, was born in Lancaster, Pa., October 12, 1828. He was educated in Lancaster, at Muhlenburg's school, near Flushing, Long Island, and at Yale College, where he graduated A. B. in 1846, and studied medicine in the University of Pennsylvania, taking the degree of M. D. in 1850. He then visited Europe for the purpose of study, and returning, settled permanently in Philadelphia in 1856. He is a member of the College of Physicians. His contributions to medical literature consist, among other publications, of notes of lectures by Bernard and Robison on the blood, and of the clinical lectures on surgery, by Nélaton; also of a number

of articles on a variety of medical subjects in American medical periodicals.

ATLEE, Washington Lemuel, of Philadelphia, was born at Lancaster, Pa., February 22, 1808, and died September 6, 1878. He was the youngest brother of Dr. John L. Atlee and a grandson of the Hon. William Augustus Atlee, one of the early judges of the Supreme Court of Pennsylvania. His maternal grandfather was Major John Light, an officer in the revolutionary war. As early as fourteen years of age he was placed in a dry goods store, but dissatisfied with the prospect of a commercial life, he entered after eighteen months the office of his brother, of Lancaster. He there devoted his time to the study of the classics, natural sciences and the preliminaries of his profession. He received his diploma in 1829, from the Jefferson Medical College, Philadelphia, in which city he was a private pupil in the office of George McClellan, M. D., Professor of Surgery. Soon after graduation he married Miss Ann Eliza Hoff, of Lancaster, and settled in the village of Mount Joy. Here he organized a literary society, delivered lectures on various scientific topics, and pursued the study of botany. In the autumn of 1834 he returned to his native city, and for ten years devoted himself with ardor and success to the practice of his profession and the pursuit of some of its higher and more abstract departments. Among the latter should be mentioned the remarkable series of experiments carried out at his suggestion on the body of an executed criminal, named Moselman, reported in the *American Journal of Medical Science* for 1840. An invitation to fill the chair of Medical Chemistry in the medical department of Pennsylvania College, at Philadelphia, led to his removal to that city in 1845. He soon became engaged in an extensive private practice, which increased so rapidly that, in 1853, he resigned the professorship, and since that time has given his whole attention to the demands of his patients. This did not prevent him, however, from taking a warm interest in the general welfare of the profession, and he was well known as an active member of the County Medical Society, president in 1874; and State Medical Society, president in 1875, and the American Medical Association, its vice-president. A brilliant extempore speaker and an able debater, his weight was always cast in favor of a higher medical education and a broad and liberal construction of the rights and duties of medical life. As a practitioner he was most famous for his advocacy of the difficult operation of ovariectomy. Commencing its performance and defending its propriety at a period when hardly another surgeon in the land dared support him, he triumphantly vindicated its merits by the statistics of over three hundred cases in his own hands, a large part of them successful in all respects. But one other operator in the world has surpassed him in the experience of such operations, and now all enlightened surgeons recognize it as an invaluable resort in the desperate cases to which it is applicable. From his own history of ovariectomy, sketched in his annual address as president, before the Philadelphia County Medical Society, we cull the more important facts. To Dr. Ephraim McDowell is accorded the honor (now generally conceded) of being the first to perform the operation, in the year 1809. Dr. John L. Atlee, of Lancaster, Pa.,

brother of the subject of this sketch, performed it on June 29, 1843, on an unmarried lady, aged twenty-five years. This was the first time that both ovaries were removed. Being associated with his brother in the case, Dr. W. L. Atlee commenced studying the literature of the operation, and spent considerable time in collecting and collating all that had any bearing on the subject. He believes that everything that had ever been reported was thoroughly gleaned from every part of the world. The result of this great labor was the publication of one hundred and one operations in the *American Journal of the Medical Sciences*, April, 1845. In this table he at first placed three names—L'Aumonier, Dzondi and Galenzowski—before that of McDowell. These cases, although associated with the ovary, were not cases of ovariectomy. So of the Houston case exhumed from the Philo-

Washington L. Atlee

sophical Transactions, and transferred to the *American Journal of the Medical Sciences*, April, 1849, and reported as a case occurring in British surgery in 1701. This unjustly accorded the English profession the priority in ovariectomy. A new edition of his table, containing two hundred and twenty-two cases, was published in 1851 in the transactions of the American Medical Association for that year. Dr. Atlee performed his first operation March 29, 1844, on a married lady sixty-one years of age. It proved fatal. Respecting the case he says: "It was on the banks of the Chicquesalunga, Lancaster county. In traveling westward on the Pennsylvania Central Railroad, soon after passing Landisville station, a small stream is crossed, on the opposite bank of which, and on the right-hand side, stands a one-story brick tenement (within the last few years raised to two stories). It was in this house, after many days and nights of in-

tense anxiety, that I first essayed this operation. I can never pass it without emotion. It is the text for many, many thoughts. No one can know the mental and moral conflicts of that hour, and I can not describe them. In that humble spot began the great battle of my professional life, a battle, on my part, unsought, yet firmly maintained on the defensive; because, although this effort was unfortunate, I had weighed the matter well and my convictions were on the side of humanity and duty. With the axiom that truth must prevail, I determined to take my position." His second operation was performed in the city of Lancaster, August 28, 1844, on an unmarried lady, twenty-four years of age. She recovered. In his published record of this case in the *American Journal of the Medical Sciences*, April, 1845, Dr. Atlee said: "I pledge myself to the profession to treat this subject in all truth and candor; to falsify, omit or withhold nothing; and to write down errors, if such there be, in honesty and without fear—taking censure when deserved. In the decision of a matter of such weight to humanity, personal sacrifices ought to be utterly disregarded. If this operation is to be established, it must be on correct statements; if its fails on such testimony, it fails justly and forever. But if its establishment be attempted on falsified reports and withheld facts, then human life must fall a sacrifice to personal and professional dishonesty, and the effort must necessarily die, covered with a mantle of human gore. Let the question, therefore, be met as it ought to be, and its history be a record of truth." This pledge he ever faithfully observed. His third operation, the first case in Philadelphia, was performed March 15, 1849. Upon moving to Philadelphia he found ovariectomy everywhere decried. It was denounced by the general profession, in the medical societies, in all the medical colleges, and was even discouraged by the majority of his own colleagues. He was misrepresented before the medical public, and was pointed at as a dangerous man, even as a murderer. The opposition went so far that a celebrated professor, in his published lectures, invoked the law to arrest him in the performance of the operation. It was his custom from the first to invite members of the profession to witness the operation, in order that they might be able to form a proper opinion of its character, and to judge of its propriety. It was, however, a rare circumstance during the probationary stage of the operation, for anyone to accept the invitation cordially and gratefully. Some did so, coldly; others politely declined; others positively refused, and emphatically condemned the operation, while others took the invitation as an insult. But after ovariectomy began to grow into favor, and since it has taken a position in legitimate surgery, an opportunity to witness it is sought after by those very individuals who were disposed to condemn it. The strongest opposition came from those who had never seen the operation, who would not consent to see it, and who consequently knew nothing about it; while those who reluctantly ventured to witness it, as a general rule, gradually modified their adverse opinions, and finally became advocates of it. Referring to his first cases of ovariectomy, we quote Dr. Allen's exact language: "Gentlemen who were bold enough to witness the operation, were even directly accused by their professional acquaintances of be-

ing 'particeps criminis' in committing murder, notwithstanding these murdered patients recovered! Some, high in the profession, against all ethical considerations, would call upon patients who had fully decided upon the operation, for the purpose of warning them against me and certain death. The day before I operated upon my first patient in Philadelphia an eminent surgeon called upon her to assure her that she would certainly be dead in twenty-four hours. Twenty-fours after the operation I requested him to visit her, and her condition was such that he would not believe that she had been meddled with until I exposed the wound. This lady is still (1878) living in good health, and since then has survived two miscarriages, the removal of an immense tumor from the neck, and an operation for cataract in both eyes. Another medical gentleman, whose patient came to me against his positive remonstrance, attended the operation for the express purpose of being with her when she died on the operating table. She did not die and still lives, although both ovaries were removed; and he left the room a convert to ovariectomy." Particular mention was made by Dr. Atlee, in the course of his address, of the vehement opposition encountered at the hands of Professors Thomas D. Mütter and Meigs, of Philadelphia, and Prof. Joseph B. Flint, of Louisville, and also of the sympathy and support received from such men as Prof. William R. Grant, Drs. T. M. Drysdale and George McClellan, Professors S. D. Gross and N. Chapman, and Prof. Mussey, of Cincinnati. Other distinguished men who then or later indorsed the operation were Drs. Henry H. Smith and Hugh L. Hodge. In May, 1852, by invitation from him, a committee from the Northern Medical Association, consisting of Drs. Remington, Bryan and Levis, witnessed the operation in the case of a patient who would have died soon after any operation, and perhaps as soon without one, as was in fact admitted in their report, which concluded with an earnest recommendation for the adoption of the subjoined resolution: "*Resolved*, That this association, in view of the numerous fatal results ensuing upon ovariectomy, and the many disasters arising from errors in diagnosis, unreservedly deprecate the frequent performance of this operation as detrimental to the best interests of science, and fraught with the most imminent hazard to life." At a meeting of the society, held September 16, 1852, the committee reported progress; at another, on October 7, the report was postponed; at a third, on October 21, the report was made and the resolution postponed for discussion until the next meeting. That occurred November 18, when a resolution, thanking Dr. Atlee for his courtesy in inviting a committee of the association to witness the operation, was adopted as a substitute to that reported by the committee. Thereupon, on motion of Dr. Remington, the following preamble and resolution were adopted: "*Whereas*, This association, considering the great mortality resulting from ovariectomy, the extreme obscurity of diagnosis, the weight of authority against it, and the uncertainty of published statistics; therefore, *Resolved*, That, although cases have occurred, and may occur where the operation was advisable, this society can not approve of a general resort to gastrotomy for the removal of ovarian tumors. Of the members of the

committee, Dr. Bryan subsequently recognized ovariectomy by calling Dr. Atlee in consultation in cases of abdominal tumors, and Dr. Levis has himself practiced the operation. Dr. Remington died before the operation met with general recognition. The position held by Dr. Atlee in relation to another great operation, viz.: the removal of uterine fibroids, is well defined by two distinguished men. Professor Pallen, in his prize essay, presented to the American Medical Association in 1869, says: "In 1853, Dr. Washington L. Atlee startled the profession by his method of heroically attacking uterine tumors with the knife. . . . His successes were numerous, and the ingenuity of devices is deserving of the highest commendation." And Dr. J. Marion Sims, in the *New York Medical Journal*, April, 1874, says: "The name of Atlee stands without a rival in connection with uterine fibroids. His operations were so heroic that no man has as yet dared to imitate him. A generation has passed since he gave to the world his valuable essay on the surgical treatment of fibrous tumors of the uterus; but it is only within the last five or six years that the profession have come to appreciate the great truths which he labored to establish. Meadows, of London, and Thomas, of New York, have each achieved splendid results in this direction, and made valuable contributions to our literature. A few isolated cases of fibroid enucleation have been published by others, and this is about all that we can boast of since Atlee first led the way for us." Since the foregoing remarks of the late Dr. Sims, made nearly twenty years ago, the operation for extirpation of fibroid tumors of the uterus has been more frequently performed and the practice may now be regarded as a well-established surgical procedure. At this date (1893) cases of their successful removal, either by instruments or the electric needle, are almost constantly reported by leading gynecologists in the various cities of this country. As an author Dr. Atlee contributed numerous scientific articles to the *American Journal of Science and Arts*, the *American Journal of Medical Sciences*, the *Medical and Surgical Reporter*, and the *Transactions* of various medical associations; the prize essays of the American Medical Association in 1853 included one written by him, entitled: "The Surgical Treatment of Certain Fibrous Tumors of the Uterus, heretofore considered beyond the Resources of Art." His extended experience in ovariectomy was summed up in his work: "General and Differential Diagnosis of Ovarian Tumors, with Special Reference to the Operation of Ovariectomy; and Occasional Pathological and Therapeutical Considerations," 1873. Among his published addresses and papers may be specially cited the above alluded to history of ovariectomy, entitled: "A Retrospect of the Struggles and Triumphs of Ovariectomy in Philadelphia," delivered February 1, 1875; that of "Old Physic and Young Physic: Some of the Changes of the Past Half-Century Contrasted and Compared, and their Advantages Estimated," delivered in 1875, as president of the Medical Society of the State of Pennsylvania; a paper on "The Treatment of Fibroid Tumors of the Uterus," read before the International Medical Congress, Philadelphia, in September, 1876; and a paper on "Sarcoma of the Ovaries," read before the American Gynecological Society, in 1877.

ATWATER, Hiram Hayden, of Burlington, Vt., was born in Norfolk, N. J., February 17, 1828, and died in the former city August 19, 1891. His father was a physician at Norfolk, N. J., but the son was educated at Burlington and at Woodstock Medical College, graduating in 1851. He first settled in Brooklyn, N. Y., but in 1861 removed permanently to Vermont. He was pension examiner for many years beginning in 1862. He was health officer of Burlington in 1867, and commissioner of lunacy for two years. Dr. Atwater had a special bent in the direction of obstetrics and was for many years the instructor in that branch in the University of Vermont. He was also one of the medical staff of the Mary Fletcher Hospital. He was the author of various contributions in the Vermont and other medical transactions and the *American Journal of Obstetrics*.

AYER, Washington, of San Francisco, California, of Scotch-English descent, was born in Haverhill, Massachusetts, June 18, 1823. After receiving an academic education he entered the Harvard Medical School, and received his medical degree from that institution in 1847. He then established himself at Lawrence, Massachusetts, and engaged in the general practice of his profession. But the wave of excitement that swept over the country on account of the discovery of gold on the Pacific coast reached his city soon after, and in February, 1849, he sailed for California, and arrived in San Francisco on July 5, 1849, and has since been a resident of that city. While engaged in general practice he has given some attention to surgery, and has performed many capital operations—notable in a number of cases of uterine fibroids. Dr. Ayer is a member of the San Francisco Medical Society, and was elected president of this organization in 1877. He is also an honored member of the California State Medical Society; of the Society of California Pioneers, and of other social and scientific organizations. He has taken an active interest in municipal and educational affairs, and from 1865 to 1870 served as a member of the San Francisco Board of Education. Dr. Ayer is widely known as one of the oldest and most prominent medical men of his adopted State.

AYERS, Daniel, of Brooklyn, N. Y., died January 18, 1892, aged sixty-nine years. He was a graduate of Princeton and of the New York University. He settled in Brooklyn in 1845, and acquired a surgical fame and fortune therefrom in a short time. He retired after forty years of remarkable activity, and began to dispense gifts to such institutions as the Wesleyan University, the Long Island College Hospital and the Hoagland Laboratory. His benefactions to the university just named are estimated to exceed \$250,000. He assisted in founding the Brooklyn City Hospital, and was associated with Dr. Louis Bauer, who went to St. Louis afterwards, in a kind of post-graduate surgical clinic, which was the scene of some pioneer joint surgery in the United States. He was chosen Emeritus Professor of Surgical Pathology in the Long Island College Hospital in 1874, and delivered courses of lectures most elaborately illustrated by specimens and artistic models, in the making of which practice had made him expert. Two sons, Dr. Morgan Ayers and Messenger Ayers, succeed him.

AYERS, William O., of Brooklyn, N. Y.,

was born in New Caanan, Conn., September 11, 1817, and died in the former city April 30, 1887. He received his academic education at Yale University, from which he was graduated in the class of 1837. His avocation during the ensuing fifteen years was that of an educator. His last engagement in this capacity was in Boston, Mass., where he had been employed for a period of seven years. In the latter part of this service he began the study of medicine and received the degree of M. D. from the Yale Medical School in 1854. Immediately after graduation he removed to San Francisco, Cal., and was engaged in practice in that city for a period of seventeen years, and occupied the chair of Theory and Practice of Medicine in Toiland Medical College during a portion of this time. Shortly before the great fire of 1871, in Chicago, he removed to that city and resided there until 1878, when he removed to New Haven, Conn. In the following year he was appointed lecturer on diseases of the nervous system in his *Alma Mater*—the Yale Medical School—holding this position till early in 1887, when, on account of failing health, he removed to Brooklyn, N. Y. While Dr. Ayers had made a special study of nervous diseases, he had also given much thought to various branches of natural science, particularly to ichthyology, on which he had published many articles in the Proceedings of the Boston Society of Natural History and of the California Academy of Sciences.

BABCOCK, Elmer Eugene, of Chicago, Ill., was born on a farm near Platteville, Grant county, Wis., June 8, 1859, and is of Scotch-English parentage. Through Gideon Babcock, an officer in the revolutionary war, to Robert Babcock, of Puritan stock, he has direct lineage. After a liberal education he studied civil engineering and surveying, but laid the transit aside for the scalpel in 1881, entering the office of Drs. Bowen and Hart, surgeons of the Burlington and Missouri R. R. at Lincoln, Neb. After one and one-half years of pupilage he matriculated at the College of Physicians and Surgeons, of Chicago, graduating in 1884. He was then selected to represent his college for two years as resident surgeon of Cook County Hospital, receiving its diploma in 1886, since which time he has engaged in private practice, devoting himself especially to surgery. He was married in 1886 to Miss Ida Amelia Dobson, of Lincoln, Neb. Since 1888 he has been connected with the College of Physicians and Surgeons of Chicago, teaching various branches of surgery and is now Professor of Surgical Anatomy and recording secretary of the faculty. He is attending surgeon to Cook County Hospital and a member of the following societies: Chicago Medical Society, Cook County Hospital Clinical Society, Chicago Medico-Legal Society, Illinois State Medical Society, American Medical Association, Chicago Pathological Society and Chicago Practitioners' Club.

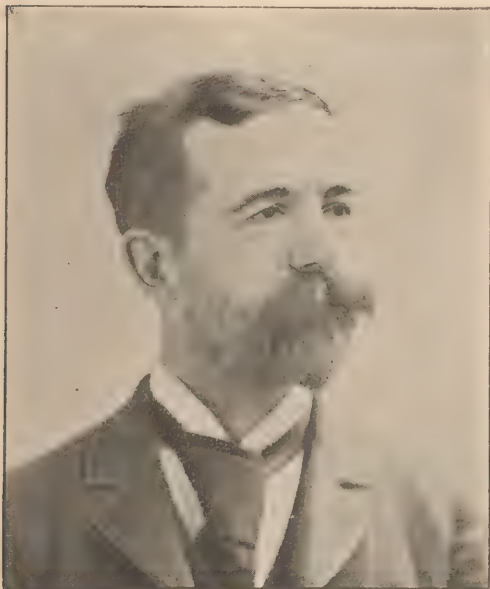

BABCOCK, Robert Hall, of Chicago, Ill., was born in Watertown, N. Y., July 26, 1851, but was reared in Kalamazoo, Mich. In April, 1864, he lost his sight in consequence of an accident, and a few months subsequently left home to become a pupil of the Institution for the Blind, in Philadelphia. Three years later he entered the preparatory department of Olivet College, Olivet, Mich. In two years he had prepared himself for college, and entered

upon a classical course at Western Reserve College, Hudson, Ohio. He did not graduate there, however, but finished at the University of Michigan. Nevertheless, the former institution conferred upon him the title of Master of Arts, in June, 1888. In 1874 he began his medical studies, taking two courses of lectures at Ann Arbor. He then entered the Chicago Medical College, from which institution he received the degree of M. D., in the spring of 1878. The following year he attended lectures at the College of Physicians and Surgeons, at New York, being graduated as one of the ten "honor men," in February, 1879. He was married a few months later, and in July, 1880, went to Germany, where he passed three years, chiefly at Munich, in study of diseases of the chest. In October, 1883, he began the practice of his profession in Chicago. He became connected with the Southside Free Dispensary, and remained for seven years as one of the attending physicians to the throat and chest department. In 1886 he was elected to the faculty of the Chicago Polyclinic, from which capacity he resigned two years subsequently, and soon thereafter helped to found the Post-graduate Medical School of Chicago. He held the professorship of Clinical Medicine and Physical Diagnosis. In January, 1890, he was appointed specialist in diseases of the chest to Cook County Hospital, a position which he has held for the past three years. In July, 1891, he was elected professor of Clinical Medicine, Diseases of the Chest and Physical Diagnosis in the College of Physicians and Surgeons of Chicago, a position which he still occupies. He is a member of several city, State and national medical societies. He has contributed a number of articles to leading medical journals, both in the east and west, but is not author of any work. It was his blindness which led him to devote himself to diseases of the heart and lungs, in which specialty acute hearing is the chief requisite of the diagnostician.

BACON, Charles Sumner, of Chicago, Ill., was born in Spring Prairie, Wis., July 30, 1856. He was graduated at Beloit College in 1878, his preparatory education having been obtained in the common schools and the Whitewater State Normal School. He then taught three years in the High School in Racine and the German-American Teachers' Seminary, in Milwaukee. After a three years' course in medicine in the Chicago Medical College, he graduated in 1884. Having served eighteen months as interne in the Cook County Hospital, Chicago, he began the practice of his profession in the same city. In 1886 he was appointed Pathologist and Assistant Surgeon to the Alexian Brothers' Hospital, which position he held for two years. On the founding of the Chicago Polyclinic, in 1886, he was appointed Assistant Gynecologist, in 1889 he was made Instructor and in 1891 Professor. He spent the summer of 1891 in studying gynecology in London, Paris and Berlin. He has spent some time in perfecting apparatus for controlling the Edison incandescent current for medical uses. His writings consist of papers presented to medical societies, among which may be mentioned, "Report of an Examination of Dairy Milk and the Milk of Cows Fed on Distillery Slops," "Report of a Case of Sarcoma of the Nose Cured after many Operations," "Report of Laparotomy for Monthly Molimina in a Woman without Vagina,

Uterus or Ovaries," and "Some Considerations concerning Purpura Hæmorrhagica with a Report of Two Cases of Idiopathic and One of Symptomatic Purpura."

BACON, Joseph Barnes, of Chicago, Ill., was born near Hills, Illinois, in 1854, and is of American parentage. His preliminary education was begun in the district school and continued at the Macomb Normal College and the Northwestern University. He graduated at the Texas Medical College in 1879 and at the Chicago Medical College in 1881. After practicing general medicine for three years at Montideo, Minn., he went abroad and studied in the hospitals of Heidelberg and Vienna in 1884 and 1885. Returning from Europe he located at Macomb, Ill., and did a general surgical practice for seven years. In 1892 he was appointed to the chair of Rectal Surgery in the Post Graduate Medical School of Chicago, and

Joseph B. Bacon.

has since then limited his practice to that specialty. Dr. Bacon has devised a new electrode for treating hemorrhoids by electricity, also an instrument for tamponing the rectum that is ideal as a means of checking hemorrhage. In March, 1893, he devised a new method of treating rectal strictures—by transplanting a piece of gut from the ileum and anastomosing its ends above and below the stricture with the rectum, or where the sigmoid mesentery is long enough, he makes only a partial transplanting, by bringing down the sigmoid and anastomosing it below the stricture and sutures the surfaces of the rectum and sigmoid, thus making a firm septum, which is subsequently removed by compression forceps.

BAILEY, William H., of Albany, N. Y., was born at Bethlehem, that State, December 28, 1825. After receiving an academic education he entered the Albany Medical College, from which he was graduated M. D. in 1853. He soon after commenced the practice of his pro-

fession, at Utica, N. Y., but removed the following year to his present location. He is a member of the American Medical Association and Medical Society of the State of New York. He was made secretary of the latter organization in 1865, and annually re-elected for the succeeding ten years. He is also a member of the Medical Society of Albany County, N. Y., and was elected president of the same in 1870. Dr. Bailey is an honorary member of the Medical Society of the State of Texas, and corresponding member of the Medico-Legal Society of New York.

BAKER, Henry Brooks, of Lansing, Mich., was born December 29, 1837, at Brattleboro, Vt. He went to Michigan in 1849. His early education was obtained partly in the common schools of Vermont, Massachusetts and Michigan, and by self-teaching. He studied medicine, attended lectures at the medical department of the University of Michigan in 1861-1862, and graduated from the Bellevue Hospital Medical College, New York City, in 1866. From the summer of 1862 to the close of the war, he served in the medical department of the 20th Michigan Infantry Volunteers, 9th army corps, and at operating and general hospitals, becoming, after July, 1864, the medical officer in charge of the regiment. He was taken prisoner at the Wilderness, but soon rejoined the division hospital. After the war he practiced in civil life in Michigan about four years. In 1870 Dr. Baker took charge of the compilation of the vital statistics of Michigan, and continued in charge of them for many years, compiling, also, the very useful volume of "Statistics of Michigan" for 1870, based on the United States census. In 1870 Dr. Baker was the first to move for a State board of health; the board, subsequently established in 1873, was the first one wholly founded upon the plan of "moral suasion," its functions being advisory, not mandatory. This feature of the law was due to Dr. Baker's influence. Since that time many other State boards of health have been founded, most of them upon the same plan. Since the organization of the State board of health in 1873, Dr. Baker has been its secretary, and the yearly reports, circulars of instruction and various other documents pertaining to the work of the office of the board, exhibit evidence of his painstaking care and ability to discharge the duties involved. Dr. Baker is a member of the Michigan State Medical Society, of which he has been treasurer and vice-president, and of the American Medical Association of which he has been secretary and chairman of the section on State medicine. He was a member of the International Medical Congress at Philadelphia in 1876, is a Fellow of the Royal Meteorological Society, London, England, a member of the American Climatological Association, is a vice-president of the American Social Science Association, has been treasurer and president of the American Public Health Association, and is an honorary member of the French Society of Hygiene, Paris. He has contributed many papers to prominent journals and transactions of societies on medical and other subjects. His published writings are chiefly on psychological, physiological, statistical and sanitary subjects. His scientific sanitary papers have treated more particularly of the causes of diseases. He has given especial attention to the relations of sickness from sev-

eral diseases to climatic, meteorological and other conditions. One of his papers, read before the American Public Health Association, at St. Louis, was on "The Relation of Low Water in Wells to the Causation of Typhoid Fever," but he did not reach the same conclusions as did Pettenkofer, in Munich, who was the first to bring this subject into prominence.

BALDY, John Montgomery, of Philadelphia, was born in Danville, Montour county, Pa., in 1860, and is of English and Irish descent. He received his academic education in his native town, and began the study of medicine there under the preceptorship of Dr. James D. Strawbridge. He received his medical degree from the University of Pennsylvania, in 1884, and pursued post-graduate studies in Philadelphia. He was also resident physician to the Philadelphia Hospital. Dr. Baldy then practiced his profession one year at Scranton and removed to Philadelphia. In 1887 his medical education and training was supplemented by courses of study in Berlin, Vienna and London. His practice is limited to gynecological work. He was physician to the Philadelphia Dispensary from 1885 to 1888; was surgeon to the Gynecian Hospital in 1890; gynecologist to St. Agnes Hospital in 1891, and since 1891 professor of gynecology in the Philadelphia Polyclinic. He is a member of the American Medical Association; the Pennsylvania State Medical Society; the Philadelphia Obstetrical Society; the Philadelphia Pathological Society, and is Fellow to the College of Physicians, Philadelphia; Fellow to the American Gynecological Society; Fellow to the British Gynecological Society, and is editor of and contributor to the "American Text-Book of Gynecology."

BALDWIN, James Fairchild, of Columbus, Ohio, was born in Orangeville, N. Y., Feb. 12, 1850. His father was a Presbyterian minister. His mother was a sister of Pres. James H. Fairchild, of Oberlin, Ohio, Pres. E. H. Fairchild, of Berea, Ky., and Pres. George T. Fairchild, of Manhattan, Kan. He graduated in the Arts at Oberlin College in 1870, and Medicine at Jefferson College in 1874. His graduating thesis, on "The Relation of Ozone to Disease," was awarded the Faculty prize of one hundred dollars over one hundred and fifty competitors. He located in Columbus Sept. 1, 1874. In 1875 he assisted in the organization of the Columbus Medical College, with which institution he was connected until 1882, at first as professor of physiology, and afterwards as professor of anatomy. In 1882, he was summarily removed from his professorship by the Board of Trustees because of his vigorous opposition to the low standard of the school. In 1876, he began work in medical journalism, being then one of the editors of the Ohio Medical Recorder. He has continued in this work until the present, being now editor of the Columbus Medical Journal. It was an editorial in this journal that, although not written for that purpose, secured for him in 1883, the award of a full nickel bicycle, from the Pope Manufacturing Co., in a series of prizes offered for articles written by physicians on the use of the wheel. In addition to the two prize essays mentioned, and many articles in his own and other medical journals, he, in 1888, contributed to the Reference Hand Book of the Medical Sciences the article on Personal Nomenclature. July 17, 1889, he per-

formed the first Porro operation ever made in Ohio. The patient was a dwarf, forty-five inches in height, and both mother and child were saved. This operation was the ninth of the kind in the United States, and the third successful one. In the summer of 1889, he removed a tumor from the vocal cords of a lad from Licking Co., and also one from a girl from Madison Co., by means of intubation, this method of treating these tumors being original with him, and these the first cases so treated. (New York Medical Record, March 8, 1890.) In 1890, he, with other physicians, incorporated the Ohio Medical University, which gave its first course of instruction, in its departments of medicine, dentistry and pharmacy in 1892-3. He holds the position of Chancellor of this University, and also the chair of operative gynecology in the medical department. He is a member of the Columbus Academy of Medicine, of the Central Ohio Medical Society (president in 1891), and of the Ohio State Medical Society.

BARD, John, was born in Burlington, N. J., February 1, 1716, and died in Hyde Park, N. Y., March 30, 1799. He was the son of a New Jersey magistrate of Huguenot origin, and after attending a classical school was apprenticed to the elder John Kearsley, a noted physician of Philadelphia, Pa., who, if the account speaks truly, was no lenient master. "He treated his pupils with great rigor, and subjected them to the most menial employments." An apprenticeship at that time was no sinecure; it was a period of probation attended with toil and exactions. The pupil lived, for the most part, with his master—was constantly subject to his orders, whether in the task of preparing medicines to be used in his daily rounds, in carrying them to the patients, or in making fires, keeping the office clean, and other household duties now devolving upon domestics. "To these, Dr. Bard has been often heard to say, he would never have submitted but from apprehension of giving pain to his excellent mother, and the encouragement he received from the kindness of her particular friend, Mrs. Kearsley, of whom he always spoke in terms of the warmest gratitude, affection and respect. Under such circumstances he persevered to the end of seven tedious years, stealing his hours of study from sleep, after the family had retired to rest, and before they arose from their beds." After practicing his profession a few years in Philadelphia he established himself in New York (1746) and soon took rank as one of the ablest of American medical men. In 1759, when an epidemic of malignant fever threatened New York, having been commissioned to devise means to check the spread of the disease, he recommended the purchase of Bedloe's Island for the isolation of cases of infectious disease, and was placed in charge of the hospital that was built in accordance with his suggestion. He was the first president of the New York Medical Society. He has left a paper on "Malignant Pleurisy," and several treating of yellow fever, all of which were published in the *American Medical Register*. He was succeeded by his son, Dr. Samuel Bard, the subject of the following sketch, who was one of the founders of the first medical school in New York, and a distinguished practitioner of that city.

BARD, Samuel, of New York, was born at

Philadelphia, Pa., April 1, 1742, and died at Hyde Park, N. Y., May 24, 1821. One of his biographers, the late Dr. James P. White, says: "Among those who have been conspicuous in the profession of medicine, whose lives should be recorded with especial reference to their value as examples worthy of imitation by all just entering upon the discharge of its duties and responsibilities, few probably may claim a higher place than the subject of the following memoir. Without claiming for Dr. Bard great genius, or brilliant talents, without asserting that nature had bestowed upon him gifts superior to those possessed by many who daily embark in the same pursuit, yet will it, in the course of this narrative, be perceived that by industry in the study of its several departments, by diligence throughout a large professional career, in the discharge of all his obligations as a practitioner, and by cultivating all the social and Christian virtues he elevated himself to the very first rank as a medical scholar, a philanthropist and a citizen. What he attained may, by pursuing a similar course, be the lot of every neophyte. The path which he trod is open to all. The object for which he successfully contended encompass all that is most desirable in this life, and secures a fadeless inheritance in the life to come." "The unexceptionable character of the man, the value of the example furnished in the life of Dr. Bard, in his social, religious and professional intercourse with his medical brethren and with the world, will, it is believed, furnish an adequate apology for the length of the following narrative and the minuteness of detail in private, social and other matters, which may not possess interest to the medical practitioner exclusively." The ancestors of Samuel Bard, preferring adherence to their faith rather than submission to the requisitions of an arbitrary decree of the French government, became exiles under the provisions of the revocation of the Edict of Nantes. To the same decree was America indebted for many of the heroes of the revolution. To this intelligent class of refugees in this country she is also indebted for much of the spirit of civil and religious freedom which led to the declaration of American independence and the successful resistance to British oppression and intolerance. Peter Bard, the paternal grandfather of Samuel, on his arrival in America, established his residence upon the banks of the Delaware, a short distance above Philadelphia. Here he soon after united his fortunes with those of Miss Marmion, the daughter of an English gentleman, who also abandoned country and home from scruples of conscience and sought their enjoyment in the New World. From this marriage sprung the immediate ancestor of the subject of this sketch, Dr. John Bard, one of the most distinguished practitioners of his time, the friend and companion of Franklin. This renowned physician received his education and commenced the practice of his profession in the city of Philadelphia. Here he became attached to the granddaughter of Peter Falconer, another distinguished French refugee, who had emigrated to New York in the capacity of private secretary to Lord Cornbury, governor of the province and favorite cousin of Queen Anne. Not long subsequent to this event the subject of the present memoir was born, and whilst his father and family were yet residing in Philadelphia. In 1746, how-

ever, when his eldest son, Samuel, was but four years old, Dr. John Bard was induced to remove to the city of New York, where he long occupied a prominent position among the medical and literary men of his period. Soon after his arrival in New York, the education of his son commenced. Of precocity of talent no evidence appears; but the few anecdotes related of his early years show the peculiar traits of his character to have been rather a felicity of nature than the tardy fruits of discipline. He was, however, a quick, industrious and amiable child, and the instruction given by his observant mother to his master is frequently cited to show her opinion of his capacity. "If Peter," said she, "does not know his lesson, excuse him; if Sam does not, punish him, for he can learn at will." The subject of this sketch was early impressed by his parents with a sense of religion and disciplined in the path of rectitude. They often told him that any fault might be excused except a want of truth. After passing through courses of study with private teaching and the completion of his academic education at Columbia College, he was led by his own wishes and the choice of his father, to adopt the study of the medical profession. His opening talents were viewed by a partial parent in so strong a light, and so just an estimate did that parent place upon the importance of being fully and thoroughly taught in the several sciences upon which medicine is based, that he determined to educate him abroad. The School of Edinburgh was at this time in the highest repute, and was accordingly selected as the great source from which young Bard was to derive his medical education, and form his character for future life. After much anxious preparation, at the early age of nineteen, he accordingly bade adieu to his native country, with a mind stored with such learning as the colonies then afforded. This occurred in September, 1761, at a period when Great Britain was at war with France, nor did he escape the hazards incident to a sea voyage under such circumstances. The first intelligence which his father received from him was contained in a letter, dated Bayonne Castle, announcing that in three weeks after embarking at New York, he fell into the hands of the enemy, and was now in confinement. It was fortunate for our young prisoner that Dr. Franklin, the intimate friend of his father, then resided in London, as agent for several of the Colonies. By his kind assistance the gloom of a prison was soon exchanged for the freshness and freedom of the country, and after five months residence in France, he proceeded on his way to the British metropolis. Arrived in London young Bard now entered upon the great object of his visit with that intelligence and zeal which through life marked his character. His letters of introduction were to the first men of the age, by means of which he became immediately known to Fothergill, Hunter, Mackenzie and others. The gentleman under whose special instructions he placed himself, was Dr. Alexander Russell, an amiable and able man, well known in his day by various communications to the Royal Society and other writings. In September, 1762, he repaired to Edinburgh, and here he also enjoyed the privilege of associating with characters of the first eminence. At this time Robertson, the historian, was at the head of the University, and Rutherford, Whytt, the

two Monros, father and son, Cullen, Hope, Ferguson, Gregory and Blair, were among its teachers. Under such men was Bard trained, and here the torch was lighted which subsequently inflamed many kindred bosoms. On completing his studies he wrote an inaugural thesis entitled "*De Viribus Opii*" which was carefully prepared and ably defended at his examination, was spoken of with great respect by competent medical men and which admitted him to his medical degree. His diploma was dated September 6, 1765. Having completed his course of medical education, he employed some time in an excursion through the most interior parts of Scotland, and various parts of England, and the scenes which presented afforded him the highest gratification to which he often afterwards alluded with feelings of enthusiastic admiration. On his last visit to Dr. Fothergill he was given much salutary advice, who, in concluding, gave him what he termed the secret of his own success: "I crept," said this eminent physician, "over the backs of the poor into the pockets of the rich." This anecdote, giving the origin of a maxim which has since been often repeated, may again answer as a useful hint to the young practitioner who may chance to read it. Dr. Bard, himself, often repeated and urged upon young physicians a similar prudential maxim in that the basis of their practice and their fame, to be permanent, should be laid in the opinions of the many, and thus growing up by insensible degrees, it would be free from the dangers that attend on a premature reputation of a narrow and wavering patronage. After an absence of five years abroad, Dr. Bard returned to New York. The expenses of his education had exceeded one thousand pounds, a large sum to expend for such a purpose at that early period, and which had involved his father in debt. To relieve his self-sacrificing parent from embarrassment incurred in his behalf, he entered at once upon the exercise of his profession in partnership with him, devoting himself to it with native enthusiasm and faithful perseverance. For three years he drew nothing from the profits of their joint business, which amounted to nearly fifteen hundred pounds per annum, beyond his necessary expenses, allowing all the remainder, which he might justly have claimed, to go towards the liquidation of debts, which in honor he regarded as his own. Considering himself at that time exonerated from all other claim than that of gratitude, he proceeded to form a more tender and more lasting union, and trusting to Providence and his own exertion, his marriage to his cousin took place whilst his pecuniary resources did not exceed one hundred pounds. With this lady, in uninterrupted harmony and affection, he lived through the long and chequered period of fifty-five years. Dr. Bard had early formed a plan for a medical school, and within a year after his return from Europe, an organization was effected and united to King's College. His associates in this laudable enterprise were Drs. Clossy, Jones, Middleton, Smith and Tennant; while to him, then but in his twenty-eighth year, was given by common consent what was considered the most responsible and influential department of the Practice of Physic. Thus early did he begin to repay his debt of education to this literary institution, which for forty years he continued to serve, as circumstances

demand, in almost every branch of experimental and medical science; and for the last twenty years of his residence in the city, as trustee and dean of the Faculty of Physic. Medical degrees were first conferred by this school, in 1769, when a public address was delivered by Dr. Bard, in which he displayed that persuasive eloquence with which he always urged a good cause. It has been a disputed question as to the priority of the first medical school in this country. Referring to the school established by Bard, Dr. White, the biographer previously quoted, has written: "Though not the first lectures which were delivered on medical subjects, it would appear to be the first regularly organized complete Faculty for that purpose in America." Upon this point the late Professor Francis, of New York, has said: "Bard is most closely associated with the first medical school of the colonies; for though Philadelphia boasts an origin some two or three years earlier, it was in the New York school (King's College) that the first entire faculty of medicine was created, as that first association, for the first time in this country, established an independent Professor of Obstetrics, thus making for the first time, what is now universal in all the professorships of the regularly organized schools. Philadelphia did not establish midwifery as a separate professorship until some thirty years after when James, about 1810-11 was appointed; Shippen had given Anatomy and a few lectures on midwifery from the first foundation of the Philadelphia school until his death." On May 16, 1769, Dr. Bard delivered before the officers of Kings College and the governor and council of the Province, a "Discourse upon the duties of a physician," in which he enforced the usefulness or rather the necessity of a public hospital and the propriety of its immediate establishment as the most efficient means of relief to the suffering poor of the city and of instruction to medical students. So convincing were his arguments, and so well timed the appeal, that it aroused the sympathy of those upon whom it was most intended to operate, and secured liberal appropriation from the city authority and a suitable structure was soon after erected; but when on the point of completion the building was entirely destroyed by accidental fire so that this noble design remained unaccomplished until 1791. From the period of its commencement until his retirement, Dr. Bard continued to be one of its visiting physicians in which he never omitted a single day to perform its onerous and gratuitous duties. Among other obligations which the members of the profession of New York owe to this same discourse, is the exposure it contains of the unreasonable and dangerous practice which then prevailed, of their charges being grounded solely on the medicine given to their patient; thus unjustly depriving them of any remuneration for that wherein alone the value of their services consisted, and exposing them to the constant temptation, if not absolute necessity of prescriptions, often needless, and sometimes hurtful. This bold expostulation probably tended in no small degree to hasten the change, which on this point soon after took place, separating the duties of the physician from those of the apothecary. On the outbreak of the Revolution and the occupation of New York by the British troops, Dr. Bard removed to New Jersey, but again resumed his

professional duties in that city in 1784. While the General Government was sitting in New York President Washington had recourse to Dr. Bard's professional skill in his own case. In a letter to a friend he says: "The President's complaint continues to amend, so that I have not the least doubt of effecting a perfect, and I hope a speedy cure. It will give you pleasure to be told that nothing can exceed the kindness and attention I receive from him." On one occasion being left alone with him, General Washington, looking steadfastly in his face, desired his candid opinion as to the probable termination of the disease, adding with that placid firmness which marked his address, "do not flatter me with vain hopes; I am not afraid to die, and therefore can bear the worst." Dr. Bard's reply, whilst it expressed hope, acknowledged his apprehension. The President replied, "whether to-night or twenty years makes no difference. I know that I am in the hands of a good Providence." The elder Dr. Bard was subsequently called in consultation at the suggestion of General Washington, and by the blessing of that "good Providence" in which he trusted, his life was preserved to his country at a period when it never more needed the councils of his calm, prospective wisdom. The result of this illness was an intimacy with his patient, which Dr. Bard justly felt proud of. It continued unbroken until the removal of the seat of government to Philadelphia, an event which he much lamented for many and obvious reasons. Temperance, exercise and early rising had strengthened his naturally weak constitution and enabled him to go through a daily course of extraordinary professional labor. One of his early students thus speaks of a winter residence in his family: "He rose at the earliest hour; at five o'clock he was superintending the studies of his son and myself, and engaged in preparing his public lectures; from breakfast till night I saw no more of him, except in the streets on professional business; then indeed, himself, his phaeton and servant were to be seen at most hours, both of the day and night." Into his literary gratification Dr. Bard is said to have carried all the ardor of his character; he seized upon every new publication of merit with the avidity of a famished appetite, and during its perusal was both deaf and blind to all causes of interruption. Of personal courage, Dr. Bard had a great share, but it did not arise from forgetfulness of danger so much as from disregard to it. His mind was intent on the duty to be performed and weighed not the risk that attended it. In illustration, an instance may be mentioned of his conduct in the popular tumult commonly called "The Doctors' Mob," excited in the year 1788, against the physicians of the city, from suspicion of their robbing the graveyards. In this riot, which for two days set at defiance both the civil and military forces of the city, Dr. Bard exhibited a calm and dignified composure, which seemed to awe even the wild passions of the populace. Conscious of his innocence of the alleged charge, he resisted the most urgent solicitations of his friends to flee or conceal himself; but as the infuriated mob approached his house, ordered the doors and windows to be thrown wide open, and paced his hall in full view of them as they drew near. His calmness, or

his character saved him; they approached with horrible imprecations, gazed awhile in silence, and then passed on with acclamations of his innocence." That this composure was the triumph of mind over body may be safely inferred from the anxiety and sensibility he evinced when the sufferings of others were in question. This temperament unfitted him, as it did his favorite teacher, Cullen, and many other eminent physicians, for a calm surgical operator. The first operation he performed, having completed it with a steady hand, he fainted as soon as the wound was dressed and the patient safe. His anxiety of mind was so great on these occasions that he is known to have passed the entire night before making an important operation, without sleep, pacing his chamber, and absorbed in reflections upon the responsibilities involved in its performance. As a physician this acute sensibility, so far from an impediment, was, in no small measure, the ground both of his popularity and success. It stimulated him to greater efforts in storing his mind with the history, symptoms and location of disease and increased his vigilance in the application of remedial measures. Being of a hopeful temperament also, whilst it sometimes depressed his feelings, it never lessened his exertions. It gave the warmth of friendship to professional formalities, inspired the patient with confidence in his skill and thus giving relief to the mind, paved the way for that of the body. To the friends of the sick his manner, or rather his character, was peculiarly comforting—to the skill of the physician he added the interest of the relative. They were satisfied that everything was done his art could do; that neither coldness, nor selfishness, nor the pursuits of pleasure or ambition, withheld him from any personal exertion. His look and language and actions all spoke the deep interest he took in the result; showed a heart not then set on reputation or profit, but filled with sympathy for human suffering and alive in all its energies to devise means for its relief." The comparison Dr. Bard once made use of in a case of violent disease will illustrate this excitement. "I feel," said he, "as if I had a giant by the throat and must fight for life." Of the success of medical practice it is not easy to speak; but there is no doubt that this powerful union of heart and head often produced wonderful recoveries, and the universal attachment of his patient certainly evinced no common degree of reliance on his professional skill. "In practice Dr. Bard was guided more by the cautious experience of an observing mind than medical theories. In doubtful cases he was content to prescribe rather for symptoms present than the disease, and trusting much to the curative effects of nature, was content to consider himself nature's interpreter and ministering servant, following, not guiding her, and finding his chief employment in removing the obstruction which impeded her wise course to returning health. Whilst he did not undervalue the improvements in modern medical science, he cautioned young practitioners against too great readiness in receiving new names, new theories and new remedies." "New names," he said, "are always deceiving, new theories are mostly false or useless, and new remedies for a time are dangerous. This rage for novelty pervades our profession, es-

pecially in this country. Hence our extended catalogue of new fevers, and hasty adoption of new remedies; hence the unlimited and unwarranted application of mercury without weight, and brandy without measure, and the lancet without discrimination; and hence I am afraid I may say, the sacrifice of many lives which might have been preserved, had they been left water gruel and good nursing." With respect to his communicating to his patients a knowledge of their danger, he says: "There is in the human mind a principle of acquiescence in the dispensation of Divine Providence, which when treated with prudence, seldom fails to reconcile the most timid to their situation. Such information, I have generally found rather to calm perturbation of mind than to increase danger or hasten the event of disease. Whenever, therefore, the duties of piety, or even the temporal interests of friends, have demanded it, I have not hesitated making, and seldom or never repented, such communication." Having accumulated by his own industry a considerable sum of money, he sent it to England to be invested in British securities. The banker in whose hands the funds were deposited failed, and it became to him a total loss. Whilst reading a letter announcing this fact, his wife observed him to change countenance, and anxiously inquired its contents. "We are ruined" said he, "that is all." "If that be all," rejoined his calmer companion, "never mind the loss we will soon make it up again." Such a spirit was contagious. Dr. Bard took courage from the example of his wife, and returned to the task with cheerful resolution. It is said that the necessities of his father three times absorbed all his means, and involved him in debt; but the same resolute and prudent management as often freed him, and eventually secured for declining age that happy medium of wealth which the wise have ever preferred as affording the greatest enjoyments with the fewest cares; and which so fully answered all their desires, that they returned to the quiet of the country at a time when the extent of his practice and the rising charges of the profession would have doubled his fortune in the space of a few years. Of Dr. Bard's time most of the literary and benevolent institutions of the city, had a share. He was one of the founders and physicians of the City Dispensary, and one of the original and active members of the Agricultural Society of his State. His exertions contributed to the formation of the first public library in New York, and, in fact, his heart and hand were with every scheme of benevolence and public improvement of his time. In the year 1791 the trustees of Columbia College, with the co-operation of the Medical Society, re-organized the department of Medicine, which the war of the revolution had broken up, at the head of which, as Dean of the Faculty, was placed Dr. Bard, who, anxious to contribute his personal exertions to the advancement of medical education gave to the students in the wards of the hospital a course of clinical lectures. At the bedside of the patient he exhibited the finest model for imitation, as teaching not merely the learning, but the manners of a physician. His kindness, his patience, his minute examination and inquiries, his cheering words of consolation addressed to the poorest and meanest, had the value of moral as well

as medical instruction, impressing the minds of the students with a conscientious sense of the responsibility of life and health which rested upon them. "Avoid," he used to say, "that affectation of quick discernment and hurried practice which generally marks the ignorant and ostentatious; hurrying from patient to patient without once reflecting on the misery and mischief they may occasion, and that life thus trifled away, will one day be required at their hands." In one of his sketches of the good physician he said: "The physician who confines his attention to the body knows not the extent of his art; if he know not how to sooth the irritation of a troubled and enfeebled mind, to calm the fretfulness of impatience; to rouse the courage of the timid, and even to quiet the compunctions of an over-tender conscience, he will very much confine the efficiency of his prescriptions, and these he can not do without, he gains the confidence, esteem, and even love, of his patients." After forming a partnership with Dr. David Hassack, partly with a view to his own relief at a period of much exertion, but principally that he might introduce to his large circle of patients one to whose medical skill he was content to transfer their safety, he at length, in the spring of 1798, bid adieu to the city and retired to his elegant country seat. He soon returned, however, to take part in the management of a fearful epidemic which had once before desolated his city, and contracted the fever himself and his life was with difficulty saved by the kind attention of his medical brethren and devoted wife. After his restoration he resided at Hyde Park the remainder of his life and gave his attention to agricultural pursuits and anticipated in some degree the course of Sir Humphrey Davy in applying the power of chemistry to elucidate the principles and improve the practice of husbandry and by his experiments diffused much knowledge among practical farmers and wrote a book concerning the best mode of treating diseases of sheep and means of preventing their infection. This work was entitled "The Shepherd's Guide," and was the result of much investigation and repeated and careful experiment. He lived at his country seat for the last twenty-three years of his life, dividing his attention with the above pursuits and an occasional consultation with his medical friends in the city and the care of such cases of sickness as occurred in his immediate neighborhood. It is a matter of regret that Dr. Bard did not give more attention to public literature. The clearness of his mental perceptions, the inductive character of his reasoning, and the manly vigor of his style would have added much to his own celebrity and the advancement of science; while the tone of religious earnestness, which pervades all his writings, would have given them much additional value, and served to vindicate the character of the medical profession as regards the stain of infidelity which has too long and too unjustly rested upon it. Upon this subject he thus expressed himself in one of his academical charges: "Galen is said to have been converted from atheism by the contemplation of a human skeleton, how then is it possible that a modern physician can be an infidel! One who is acquainted with the mechanism of the eye, and ear, with the circulation of the blood; the process of nourishment, waste

and repair, and all the countless wonders of the animal economy! He must be blind, indeed, if he does not see in these the unquestionable marks of infinite wisdom, power and goodness!" Besides the works already mentioned, Dr. Bard's publications consist of a treatise written in the year 1771, upon "*Augina Suffocativa*," a disease which then appeared in New York, under a new form, or with new virulence; another, upon "The Use of Cold in Hemorrhage," many occasional addresses to public assemblies; anniversary discourses to medical students; and the largest of his works, "A Treatise on Obstetrics," which was prepared by him after his retirement from active practice. This is, perhaps, the earliest work written upon midwifery in America, and was of superior value if not merit, from the salutary caution which it teaches in the use of those instruments, which in rash and unskillful hands have rendered this part of the art rather a curse than a blessing. It inculcated the necessity of a more frequent resort to the safer instruments, the forceps, and of lessening the frequency with which practitioners were in the habit of using the more deadly instruments, the perforator and hooks. In 1813 when a separation took place between Columbia College and its Medical School, upon the remodelling of the latter, Dr. Bard became the President of the College of Physicians and Surgeons. This honorable position he continued to hold during life, and rendered his official duties valuable to the institution by the enthusiastic interest he took in its success, the judicious plans he framed for its improvement, and the impressive discourses with which he accompanied the delivery of its degrees. In these he drew with his accustomed energy a vivid picture of the accomplished physician—in his education, in his subsequent improvement, in his professional conduct and in his private deportment. Over all these sketches he threw a moral and religious coloring, which gave them richness and force; showing the happy influence which pure moral and firm religious principles must ever exercise over professional success; and concluded one of his last addresses by presenting the character of Boerhaave, as approaching to this rare union of the physician, the scholar, the gentleman and the christian. In one devotional habit Dr. Bard resembled Boerhaave; and perhaps was guided by his example. A part of his early mornings was regularly devoted to religious reading and reflection, by which, as he himself expressed it, he endeavored to "set his mind to a right edge for the business of the day." In 1811, circumstances favoring its establishment, the church of St. James at Hyde Park was erected, of which Dr. Bard was by his liberal contribution in effect the founder, and in which he continued to find to the very close of his life, a more than ordinary comfort and satisfaction. "No equal expenditure of money," he is quoted as saying, "had ever returned to him so large an interest." From its meetings surrounded by his faithful wife, children and grandchildren, thus sanctified alike by devotion and family affection, he was rarely absent. Sickness could hardly detain him; and absence from home he always felt as a misfortune. His eldest grandson having determined on medicine as his profession, renewed all the

ardor of his grandfather's mind to prepare him for and advance him in it. He became not only his instructor, but his companion in all his medical pursuits, aided him in the arrangement of his laboratory, led the way in experiment and ran over the whole circle of his former studies with equal enthusiasm and greater pleasure, as it was now connected with the improvement of one endeared to him by the ties of kindred, and the display of such traits of character as promised fully to repay his exertions. He was alike the counselor and companion, the instructor and the friend of all young persons who were so fortunate as to have a claim upon his attention. His plans for their improvement were novel and varied, his pursuit of them eager, his commendation warm and animated, and his reproof, though tender, "vehement in love." In passing through Princeton at a period of its public commencement Dr. Bard received a mark of the high respect in which his character was held. On this occasion he was waited upon by a deputation from the trustees of that institution, who conferred upon him the honorary degree of LL.D. In the flowers and fruits of his garden he became a learned and skillful horticulturist—conversed, read and wrote upon the subject; laid exactions on all his friends who could aid him in obtaining what was rare, beautiful, or excellent in its kind; drew from England its smaller fruits, the larger ones from France, melons from Italy and vines from Maderia,—managing them all with varied yet experimental skill, which baffled the comprehension of minds of slower perception. These plans though novel were in general judicious, being the result of much reading and long experience. In the construction of a conservatory he displayed much of his talent, it being one of the first in that northern climate. In this during the severity of the winter he would often pass the greater part of the day engaged in his usual occupation of reading and writing, or his favorite amusement of chess, and welcoming his friends who called upon him to use his own sportive language, to the "little tropical region of his own creation." In the month of May, 1821, while preparing for their annual spring visit to the city of New York, and after having passed a winter of more than usual enjoyment, Mrs. Bard was attacked with a pleuritic affection, which after a few days gave evidence of a fatal termination. Dr. Bard, though laboring under a similar attack, would not be separated from her, but continued as formerly, her companion, nurse and physician. Such a long and affectionate union as theirs had been had early excited the wish, the prayer, and the expectation, that in death they were not to be divided. What was thus both wished for and expected had become, it seems, the subject of their sleeping thoughts; and a remarkable dream of Mrs. Bard's to this effect was now remembered and repeated by her husband with feelings not of superstition, but pleasing anticipations. His last hours were spent in calm but affectionate inquiries about absent friends, with rational directions as to future arrangements, and his freedom from all perturbation of spirit were so foreign from the common conception of departing humanity, that the feelings of those near him could not realize it—there were in it no images of grief from which im-

agination might draw her pattern under these circumstances not of stoical, but Christian composure, he sank to rest, in the eightieth year of his age, twenty-four hours after the death of his wife—a common grave receiving their remains. The governors of the New York Hospital, and other public organizations with which he had been connected, manifested their appreciation of the loss they had sustained, and their respect for the memory of the deceased by passing resolutions suitable to the occasion.

BARKER, Fordyce, of New York City, was born, May 2, 1817, at Wilton, Me., and died May 30, 1891. He was of English descent, and the son of a physician. He graduated at Bowdoin College in 1837, and studied medicine with Dr. Henry I. Bowditch, in Boston,

Fordyce Barker

Mass., as also with Dr. Charles H. Stedman, at the Chelsea Hospital for one year; graduating in 1841, and subsequently studying in Edinburgh and Paris, in which latter city he received the degree of M. D. in 1844. He began the practice at Norwich, Conn., but in 1845 was Professor of Midwifery in the Bowdoin Medical College, and in 1850, having been elected Professor of Midwifery and the Diseases of Women in the New York Medical College, removed to New York city. In 1854 he was made Obstetric Physician to the Bellevue Hospital, holding the office until 1874; and in 1860 became Professor of Clinical Midwifery and the Diseases of Women in Bellevue Hospital Medical College. He was Consulting Physician to Bellevue Hospital, to the Nursery and Child's Hospital and St. Eliza-

beth's Hospital, and Surgeon to the Woman's Hospital of the State of New York. He was a member of the Academy of New York, of which he was Vice-President; of the New York County Medical Society, of the New York Obstetric Society, of the New York Pathological Society, of the Medical and Surgical Society of New York, of the Medical Society of the State of New York, of which he was formerly president; and of the American Gynecological Society, of which he was elected the first president in 1876; he was also elected President of the New York Academy of Medicine in 1882, and was Honorary Fellow of the Royal Medical Society of Athens, Greece; and of the Obstetrical Societies of Edinburgh, London, Philadelphia, and Louisville; of the Philadelphia College of Physicians and of several State societies. Dr. Barker was vice-president of the International Medical Congress held in London in 1881, and the first American president of the Anglo-American Society of Paris, France, in 1889. He has contributed to medical literature numerous papers and lectures, published in different medical journals; and is the author of a treatise entitled "Puerperal Diseases." This work was translated into Italian, and published at Milan in 1875, and has also appeared in the French and German language. In addition to his College and Hospital work he had an extensive private practice. He bequeathed the greater part of his large and valuable medical library to the New York Academy of Medicine.

BARNES, Joseph K., of Washington, D. C., was born in Philadelphia, July 21, 1817, and died April 5, 1883. He studied medicine in the office of Dr. Thomas Harris, and graduated from the medical department of the University of Pennsylvania, in 1838. He then served one year as resident physician at the Blockley Hospital, and one year as out-door physician to the poor for the northwestern district of Philadelphia. He entered the army as assistant surgeon, June 15, 1840, and July 10, following, was assigned to duty at the United States Military Academy, whence he was transferred to Florida, November 9, 1840, seeing his first field service in Harney's expedition to the everglades, during the war against the Seminole Indians. He left Florida in 1842, and was stationed at Fort Jessup, Louisiana, until it was abandoned in 1846, when he conducted the convalescents of the 2d Dragoons and 3d and 4th Infantry to Corpus Christi. He was chief medical officer of the cavalry brigade during the Mexican war, and participated in every action on both General Taylor's and General Scott's line, except that at Buena Vista. After the close of the Mexican war, he was in charge of the general hospital at Baton Rouge, La., and subsequently on duty at various posts in Texas and the western departments, and as Medical Director of the Department of Oregon. He was stationed at West Point from January 3, 1854, to June 1, 1857, and during that period was commissioned surgeon, August 29, 1856. The outbreak of the war in 1861 found him on duty on the Pacific coast, and he was among the first officers ordered thence to Washington. He was appointed medical inspector, February 9, 1863; inspector-general, August 10, 1863, and surgeon-general, August 22, 1864, having then been on duty as acting surgeon-general

since September 3, 1863. He was made a brevet brigadier-general as well as a brevet major-general of the United States army for faithful and meritorious services during the rebellion, both commissions dating from March 13, 1865. For the position of chief medical officer of the army he had fitted himself by twenty years' experience, under all the conditions afforded by our military service. Under his care the medical department, then organized on a gigantic scale, attained an admirable degree of efficiency and discipline. It was at his suggestion and through his influence that the Army Medical Museum and the library of the surgeon-general's office were established, and the "Medical and Surgical History of the Rebellion" was completed. He was present at the deathbed of Lincoln, attended Secretary Seward when he was wounded by the knife of an assassin, and attended Mr. Garfield through his long confinement. He was trustee of Peabody Educational Fund, a commissioner of the Soldiers' Home and custodian of other important public trusts. The royal medical societies of London, Paris and Moscow made him an honorary member, as did also many of the other important European medical and scientific organizations. Gen. Barnes was placed on the retired list the year before his death. He was buried at Oak Hill Cemetery, Georgetown, D. C., with military honors befitting his rank.

BARTLETT, Elisha, was born at Smithfield, Rhode Island, October 6, 1804, and died in his native town July 19, 1855. Referring to the subject of this sketch; one of his biographers, the late Dr. Samuel H. Dickson says: "Within this brief term of less than fifty-one years, Dr. Bartlett occupied many positions of dignity and importance, distinguished himself as a teacher of medicine in several of its departments, lectured with great acceptance in schools of medicine in almost every section of our country, and published numerous valuable writings which will long preserve his name and memory among his professional brethren of America and Europe. Although he was not at any time in his youth a member of any collegiate institution of academic learning, Dr. Bartlett's education was a sufficiently thorough one, according to our not very lofty cis-Atlantic standard. It was the result of attendance at the best seminaries in several places in which he occasionally resided; and in a similar unfixed way, he pursued his early professional studies, with physicians of distinction established at Uxbridge, Worcester, and Providence. Thus also he heard courses of medical lectures both in Boston and Providence, and took his degree of M. D. from Brown University in 1826. Dr. Bartlett was, to use a German phrase, a many-sided man; familiar, apt, and attractive in all social circles, cosmopolitan in his wide and quick affinities; easy and graceful in his manners and universally popular, he readily gained "golden opinion from all sorts of men." It has been said that no man loves his home more than the New Englander; no one leaves it more readily, or changes it more unhesitatingly, whenever such change is attended with advantage, or offers suitable inducement or promise of benefit. And perhaps there is no better mode of obtaining a free deportment and a thorough knowledge of the world than by large travel and varied experience. Such we shall find to be in

a remarkable degree the habit of Dr. Bartlett; commenced in childhood and extending to the very close of his life. Soon after his graduation he crossed the Atlantic far better prepared to improve the opportunities enjoyed in foreign seats of learning than most of those who flock annually to Europe from our shores. He passed a year of assiduous labor and fruitful study at Paris, taking notes of lectures, attending the practice of the hospitals, and in every way profiting by the ample field of observation and instruction opened before him in that great metropolis. A tour in Italy, full of enjoyment and interest, preceded his return to America, which took place in 1827. At the end of that year he went to reside at Lowell, Mass., and commenced his professional career in that busy and prosperous city. He soon married, and obtained a highly respectable practice which adhered to him as long and closely as he desired while rising into a popularity that expanded far beyond his mere professional relations to the community. In 1828 he was offered the Professorship of Anatomy at Woodstock, Vermont, in the school then recently established there and which though he declined at first, afterwards accepted, lecturing there for eight or nine years, while he held a chair also in Kentucky. In 1832 he was appointed Professor of Pathological Anatomy in the Berkshire Institute at Pittsfield, Mass., where he lectured several years. It appears that he occupied for a year one of the chairs in the medical department of Dartmouth College. In 1844 he was elected Professor of the Theory and Practice of Medicine in the University of Maryland at Baltimore. We find him for six consecutive years filling the same place in the Transylvania Medical School at Lexington, Ky., of which the distinguished surgeon Dudley was the founder, and acknowledged head. Thence he removed by invitation to Louisville in the same State, where he held the Professorship of Theory and Practice, in the University of that city, at the period of its highest prosperity, to which doubtless he contributed by his reputation and exertion his full share. In 1850 he was prevailed upon to accept the chair of Institutes and Practice in the University of the City of New York, which had become vacant by the removal to the South of Prof. S. H. Dickson; being accompanied in the change by his friend Prof. S. D. Gross, who took the chair of surgery, then vacated also by the resignation of Prof. Valentine Mott. In the year 1852 occurred the death of the lamented Prof. J. B. Beck, for so long a time the useful and esteemed incumbent of the chair of Materia Medica and Medical Jurisprudence in the College of Physicians and Surgeons of New York. Being called to fill this place, Dr. Bartlett readily consented, as he thus became associated many old friends whom he highly valued, and attained a position which was especially desirable to him. But now, at last, his admirable powers of action and endurance began to yield under the sufferings of a neuralgic affection of long standing, the gradual, but irresistible, progress of which forced him within a brief period to retire from the lecture-room, as he had previously given up all other labor. He therefore left New York and went to reside in his native town in Rhode Island, where he was surrounded by a host of connections and admirers, and where, after nearly three years'

patient and resigned confinement to his invalid chamber, his suffering ended. Such is a rapid enumeration of the leading events in the life of this noted physician. He has left behind him a large catalogue of writings upon a considerable diversity of subjects, each one of which was effective and appropriate to the time and occasion. We will not attempt to recount here the entire list of his passing contributions to literature and science, but it may be affirmed that his pen was never idle. He was sole editor for awhile of a *Monthly Journal of Medical Literature*, published in Lowell; this was soon merged in *The Medical Magazine*, in the conduct of which Drs. Pierson and Flint were his coadjutors, and which continued in existence for about three years. He was an occasional and not unfrequent contributor after that time to the periodicals of several sections of our country, and his name appears on the list of collaborators to the most valued and successful of them all—the now venerable and time-honored *American Journal of the Medical Sciences*, so long and so ably edited by Dr. Isaac Hays. He then gave the most convincing proofs of his indefatigable industry, and his unyielding capacity for useful labor; for it should be remembered that he was all this while engaged in preparing and delivering courses of lectures in the several medical schools in which he occupied important and prominent professorships, and was said to be one of the most popular and attractive lecturers. One of his biographers writes that never was the professor's chair more gracefully filled than by Dr. Bartlett. "The driest and most barren subject, under his touch became instinct with life and interest; and the path in which the traveler looked to meet with briars and weeds only, he was surprised and delighted to find strewn with flowers, beautiful and fragrant." His person and demeanor, his urbane and courteous manner, and the singular beauty and sweetness of his style has been described as a magical fascination. While Professor of Theory and Practice of Medicine in the Transylvania University, at Lexington, Ky., he published "An Inquiry into the Degree of Certainty in Medicine, and into the Nature and Extent of its Power over Disease," which attracted no little attention. But his greatest work is a "Treatise on the Fevers of the United States," of which the first edition was published in 1842, and a fourth under the care of his distinguished friend and colleague, Professor Alonzo Clark, of the College of Physicians and Surgeons, New York, was issued several years afterward. Upon this publication principally rests the reputation of Dr. Bartlett both at home and abroad, and is a monument to his memory more enduring than marble or bronze. Referring to this production of Dr. Bartlett, the late Professor Dickson says: "Difficult, indeed, would it be to speak in terms of too high eulogy of this excellent volume. It is a model of its kind unequalled in value by any similar work upon the same subjects. The extensive research, the exact precision, the careful accuracy, the judicious selection of particulars, the convenient arrangement and collection of details, all show the clearness of the author's intelligence and his peculiar fitness for the task undertaken by him. Nothing known at the time seems to have been omitted; nothing exaggerated,

nothing colored for effect." In order to manifest the lofty estimate placed by our trans-Atlantic brethren upon the character and standing of Dr. Bartlett as an author the following paragraph from the *British and Foreign Review* (Jan., 1858), may be quoted. "We hail with pleasure the fourth edition of a work on which many years ago one of our predecessors bestowed the attention demanded by the importance of the subject and the skill and learning with which it was discussed. It is pleasing to us to learn that the public voice has confirmed the opinion we then formed of 'Bartlett on Fever,' but the pleasure is not unmixed, for the gifted author is cold in the grave, to observe, to think, and write no more for the benefit of mankind, but as the Greek proverb says: 'A tree never wholly perishes;' and much of the worth, much of the ability of men now living, is probably due to the example and labors of Elisha Bartlett. A man's good deeds live after him; and it is good that it should be so, for thus the world is progressive." So labored, so lived, and so died the subject of this memoir; and thus deservedly attained an eminence among the physicians of our age and country enjoyed by few. May his virtues and his worth be held in perpetual remembrance.

BARTON, Benjamin Smith, of Philadelphia, Pa., was born in Lancaster, that State, February 10, 1766, and died in the former city December 19, 1815. He was the son of Thomas Barton, an Episcopal clergyman, and his mother was the sister of the celebrated David Rittenhouse. Upon the death of his father he was transferred to the charge of the Rev. Dr. Andrews, afterwards provost of the University of Pennsylvania, who then resided at York. He studied medicine under the direction of Dr. Shippen, at the period when the University of Pennsylvania had superseded the College of Philadelphia, and in 1786 embarked for Europe to continue his studies. He was a student of the University of Edinburgh for two years, but did not graduate at that institution, determining, from personal reasons, to obtain his diploma at the University of Gottingen. The predilection of Dr. Barton for natural history, and more especially for botany, evinced itself very early. He manifested very soon in life a taste for drawing, and "in the execution of his designs with the pencil, at an immature age, he discovered that taste and genius in the art which he afterward cultivated with much success." It is said that his knowledge of drawing was acquired from the instruction of Major André, who was a prisoner of war at Lancaster. "This talent was often rendered subservient to his pursuits in natural history and botany, branches of science which are greatly assisted in their acquisition by the investigator having himself a facility in copying the subjects appertaining to them." On completing his studies in foreign schools, he settled in Philadelphia, where he soon acquired an extensive and lucrative practice. In 1789 he was appointed Professor of Natural History and Botany, and in 1795 of *Materia Medica* in the College of Philadelphia. In 1813 he succeeded Dr. Benjamin Rush as professor of the Theory and Practice of Medicine in the University of Pennsylvania. Although Dr. Barton was not the first professor of botany, he was the first of natural history, and so far as known the

first teacher of natural science in this country. He was eminently a pioneer in exploring the treasures of the western continent. He employed competent persons to collect the botanical productions of various sections of the country, who, while thus engaged in the service of a patron, laid the foundation of their own reputation. If the subjects of the theses enumerated on the Catalogue of Graduates during the connection of Dr. Barton with the Medical School be examined, one can not but be forcibly impressed with the number which treat of the vegetable materia medica of the United States. It was a department which he fostered, writing not only upon it himself, but instigating his pupils to its cultivation. Nor are these essays jejune, for under the conducting hand of the master, they took the form of experimental and practical utility, and the present generation is under obligation for valuable researches, in the field of home productions, to many aspirants for medical honors. Under his training skillful botanists were formed, whose contributions have been creditable to their native country. The works of Dr. William P. C. Barton, the nephew of the Professor, are evidences of zeal and ability in the endeavor to render available a knowledge of the medical and general botany of the United States; while of equal merit are the contributions to the same department of Dr. Jacob Bigelow, of Massachusetts. Professor Barton erected the first green-house in Philadelphia. It was in the rear of his residence on Chestnut, below Eighth Street. Although Dr. Barton had been a private practitioner, and one of the physicians of the Pennsylvania Hospital, he did not live to determine to what eminence he might have attained in the Chair of Practice, as, after one course of lectures had been delivered, and as the other was about to commence, death terminated his career. It has always been a matter of question whether Dr. Barton would have distinguished himself as a teacher of purely practical medicine, as he had done in the chair which afforded the opportunity of indulging in the especial bent of his genius. His reputation rests upon his success as a naturalist, and cultivator of the branches of knowledge depending upon the natural sciences for their elucidation. He was elected president of the Philadelphia Medical Society in 1809, and was some time vice-president of the American Philosophical Society and also a member of many other American and European societies. He contributed numerous papers to the "Transactions of the American Philosophical Society" and to the "Medical and Physical Journal," which was published by him. His most important works are: "Observations on Some Parts of Natural History," "New Views on the Origin of the Tribes of America," "Elements of Botany," an edition of Cullen's "Materia Medica," "Eulogy on Dr. Priestly," "Discourse on the Principal Desiderata of Natural History," and "Collections toward a Materia Medica of the United States."

BARTON, James M., of Philadelphia, Pa., was born in that city October 16, 1846. His parents were both born in Lancaster county, Pa. He attended the public schools of Philadelphia, going through the entire system, and graduated in 1865, receiving the degree of A. B., and later that of A. M. He entered Jefferson Medical College in 1865,

as the private student of Dr. B. Howard Rand, at that time the Professor of Chemistry, and later the dean of the college, and received his degree in 1868, presenting a thesis on the "Study of Pathology." He was immediately appointed resident physician to the Episcopal Hospital, where he remained until August, 1869. From 1869 to 1879, a period of ten years, he was chief clinical assistant to Professor S. D. Gross, the professor of surgery in Jefferson Medical College. During this time Dr. Barton also acted as private assistant to the professor, occupying offices with him, assisting him many times daily in public and private operations, and attending to his practice during his frequent absences from the city. From 1869 to 1876 Dr. Barton had charge of the Department of Surgery in one of the "Quiz" organizations connected with the college, and from 1869 to 1874 he was one of the assistant demonstrators of anatomy in the college anatomical rooms. From 1874 to 1881 he taught

James M. Barton.

Operative Surgery at the "Philadelphia School of Anatomy and Operative Surgery," to the largest classes, on that subject, in the city. From 1869 to 1879 Dr. Barton was surgeon to the Charity Hospital, of Philadelphia, and from 1879 to 1886 he was surgeon to the German Hospital. In 1882 he was elected surgeon to the Jefferson College Hospital, and in 1889 to the Philadelphia Hospital—both of which positions he still holds. He is an active member of the American Surgical Association, of the Philadelphia Academy of Surgery, Pathological Society, Medico Legal Society, of the County Medical and its allied societies, the "State" and "American Medical Association," and an honorary member of the Delaware State Society. In 1880 he spent some months attending the medical schools and hospitals of England, France and Germany. In 1887 he was again in Europe, and included the schools and hospitals of Ireland and Scotland in his visits. From 1882 to 1890 he had charge of the Surgical Department of the Philadel-

phia Medical Times, and, in addition, wrote many reviews and made a number of translations for the journal. Since 1889 he has been, and still is, editor of the department of "Anesthetics" in the *Annual of the Universal Medical Sciences*. Dr. Barton has written quite a number of papers, many of which have been read before different societies, and some of which have attracted considerable attention, among them may be mentioned: "On the Removal of the Uterus and Ovaries for Fibromyomata," "Digital Divulsion of the Pylorus for Cicatricial Stenosis," with a report of two cases on which he had operated; "Report of Sixteen Abdominal Sections of Unusual Character."—*Journal American Medical Association*, 1888; "Fractures of the Femur in Children Treated by Bryant's Method of Vertical Extension;" "Strangulated Hernia in the Aged;" "Strictures of the Male Urethra;" "Tumor of the Male Bladder;" "Report of a Successful Operation upon a Patient, thirty hours old, with Congenital Absence of a Portion of the Abdominal Wall;" "Excision of Ribs for Empyema;" "Effects of Amputation on a Patient Suffering with Phthisis;" "Separation of the Epiphyseal Head of the Femur and its Treatment;" "Details of Antiseptic Dressing;" "Hypertrophy of the Mammary Gland;" "Excision of the Hip Joint for Coxalgia," and "Nitrous Oxide Gas in the Examination of Fractures."

BATTEN, John Mullin, of Pittsburgh, Pennsylvania, was born on the bank of the Brandywine, Chester county, Pa., April 19, 1837, and is of Scotch-Irish and English ancestry. He worked on a farm and attended school in the winter until his eighteenth year, after which he taught school at various localities during the winter months very successfully and attended the Pennsylvania State Normal School at Millersville, in summers, where he afterwards graduated. He also commenced the study of medicine in the winter of 1856-7 under the preceptorship of William Compton, M. D., of Lancaster, and continued that study when opportunity presented, until his graduation from the medical department of the University of Pennsylvania in March, 1864. For eighteen months previous to his graduation he was a U. S. Medical Cadet, located in U. S. Army Hospitals at Christian Street and Broad and Cherry Streets, Philadelphia, whence he attended medical lectures. On March 22, 1864, he was appointed Acting Assistant Surgeon in the United States Navy, and was indirectly associated with Lieutenant William B. Cushing in sinking the Confederate ram, "Albemarle," at Plymouth, N. C., in October, 1864. He was on the U. S. Steamer Minnesota, the night in April, 1864, that an attempt was made by the Confederates to blow that vessel up by exploding a hundred pound torpedo under her, and he was with the celebrated expedition up Roanoke river in December, 1864, when our fleet had two vessels sunk and penetrated the enemy's country for fifty miles, fighting Confederate batteries and sharpshooters every inch of the distance and taking up and exploding eighty torpedoes. After serving on various United States Vessels of War he was honorably discharged from the United States Navy with the thanks of the Department on March 23, 1866. He then located at Exton, Chester county, for six weeks, after which he

came to Pittsburgh, Pa., and commenced practice in which he has been continuously engaged since. He is a member of the Allegheny County and of the Pennsylvania State Medical Societies and of the American Medical Association. He was also member of the Ninth International Congress that met at Washington, D. C., in September, 1887, and was a member for a long time of the "Mott Medical Club," of Pittsburgh, Pa., of which he was president for one year. He was elected President of the Allegheny County Medical Society in January, 1886, and filled that office for one year, and in January, 1888, was elected treasurer of that society and occupied that office for the same length of time. He has been for several years an attending physician at the Pittsburgh Infirmary, and also served for a time as director in the Market Bank. He is author of "Two Years in

John M. Batten

the United States Navy," and is a contributor to several prominent medical journals. He is a charter member of the Pittsburgh Medical Library.

BATTEY, Robert, of Rome, Ga., was born November 26, 1828, in Richmond county, that State. He is a son of Cephas Battey, a native of Peru, Clinton county, N. Y., and Mary A., daughter of George Magruder, of Richmond county, Ga. His ancestors, who were English, settled at Providence, R. I. He was educated at Augusta, Ga., and at Phillips' Academy, Andover, Mass., and studied medicine at Booth's Laboratory, Philadelphia, the Philadelphia College of Pharmacy, the University of Pennsylvania, and Jefferson Medical College, graduating from the Philadelphia College of Pharmacy, March 17, 1856, and from Jefferson Medical College, March 7, 1857. He has resided in Rome, Ga., from December, 1847, to the present time, excepting the interval from November, 1872, to October, 1875, during which he resided temporarily at Atlanta, Ga., as Professor of

Obstetrics in the Atlanta Medical College, and editor of the Atlanta Medical and Surgical Journal. He originated and successfully performed, in August, 1872, an operation, since known as Battey's operation, for the removal of the ovaries, with a view to effect the change of life in women, and thereby effectually remedy certain otherwise incurable maladies, an operation which has been many times repeated by himself and others. He devised, and used successfully in 1859, an improved apparatus for vesico-vaginal fistula; and in 1872 he discovered that water, introduced by the rectum, may be readily passed in the living body, the patient being etherized, throughout the colon, the small intestines, the stomach, coming out at the mouth, and he has repeatedly so passed it, as others after him have done, the entire practicability of doing it having been demonstrated upon the cadaver, at the Atlanta Medical College, in December, 1873, in the presence of the professor of anatomy, Dr. Johnson, and his class. On June 3, 1869, he performed successfully the operation of perineal section (suggested by Prof. Willard Parker, of New York), for chronic cystitis in a man of sixty-two. In April, 1874, he successfully performed the new operation of vaginal ovariectomy, being the third instance of the operation. In November, 1876, he removed from a man of forty-three a fibro-cystic tumor of the carotid region, weighing four and a half pounds, the patient making a good recovery in fourteen days. He devised, in 1858, and has often practised, a new method of treating club-foot, by the use of carved wooden splints and roller bandage. He is a member of the Georgia Medical Association, of which he was elected president in April, 1876, and of whose Board of Censors he has been chairman for many years. He is also a member of the Atlanta Academy of Medicine, the American Gynecological Society and the American Medical Association, in which he was chosen a member of the judicial council in May, 1875, and secretary of the obstetrical section at the same time, as also in June, 1876. He has contributed numerous essays and reports of cases to the various medical journals both in this country and in England. In July, 1861, he was commissioned a surgeon in the Confederate army, serving as Surgeon of the Nineteenth Georgia Volunteers; as Senior Surgeon of Hampton's Brigade; as Senior Surgeon of Archer's Brigade; as Surgeon in Charge of the Fair Ground Hospital No. 2, at Atlanta, Ga.; as Surgeon in Charge of Polk Hospital at Rome, Atlanta, and Vineville, Ga., and at Lauderdale, Miss., and subsequently at Macon, Ga., until the close of the war. He was elected President of the American Gynecological Society in 1889, and received the degree of LL. D. from Jefferson Medical College in 1890. Since the year 1876 until the present (1893) date, Dr. Battey has been established in the town of his present residence, devoting his attention to gynecological practice. He is one of the most noted surgeons of the South and his skill as an operator has gained for him a world wide reputation. He was married December 20, 1849, to Martha B. Smith, at Rome, Ga., who has borne him fourteen children.

BAUDUY, Jerome K., of St. Louis, Mo., was born in Cuba, in the year 1840. He was the

grandson on the paternal side of Pierre, only brother of Alexander Bauduy, who bore the title and rank of Baron de Bauduy, served under Napoleon I. and died a general in the French service. Upon his maternal side he was the great grandson of Baron John de Keating, who was also a colonel in the French service—a Chevalier of the Order of St. Louis—and the last of the Irish Brigade. When the Bourbons fell, he refused all solicitations to continue in the French army, and coming to the United States, with letters of introduction to General Washington, settled in Philadelphia. Dr. Bauduy was educated at Georgetown College, D. C., and afterwards completed his academic education at the University of Louvain, in Belgium. He took a three years' course of medicine in Philadelphia. His first course was in the medical department in the University of Pennsylvania; his two subse-

J K Bauduy

quent courses were at the Jefferson Medical College in Philadelphia, from which institution he graduated in 1863. He then joined the army of the Potomac, and was in the celebrated second battle of Bull Run. He was afterwards transferred to the army of the Cumberland, and was attached to the personal staff of Major-general Rosecrans. While in Tennessee he married Miss Caroline Bankhead, of Nashville. Early in 1864 he settled in St. Louis, and was chosen as physician-in-chief to St. Vincent's Private Insane Asylum, which position, with an immense outside practice, he held for twenty-four years. He was for one year consulting physician to the St. Louis County Insane Asylum; he has held for twenty-two years the chair of Nervous and Mental Diseases and Medical Jurisprudence in the Missouri Medical College, which, now in its fifty-second

year, is the oldest school west of the Mississippi river. He is one of the ex-presidents of the St. Louis Medical Society—is the author of a well-known medical work on nervous diseases, published by the Lippincotts of Philadelphia, and has been a constant contributor to medical journal literature. He has been a member of the American Medical Association, American Neurological Association, American Association of Medical Superintendents of Insane Asylums; corresponding member of the New York Society of Neurology and Electrology, and also a member of the New York Medico Legal Society.

BAXTER, Jedediah Hyde, of Washington, D. C., was born in Stafford, Orange county, Vt., May 11, 1837, and died December 3, 1890. He was educated in his native State, receiving the degree of B. A. from the Academic Department of the University of Vermont in 1859, and that of M. D. from the medical department of the same institution in 1860. He then went to Washington, but in 1861 relinquished private practice and entered the United States service as Surgeon to the Twelfth Massachusetts Regiment, Col. Fletcher Webster commanding. He was promoted to be Surgeon of the United States Volunteers in 1862, and was brevetted Colonel in 1865. In 1867 he was appointed assistant medical purveyor, and in 1874 was made chief medical purveyor, which office was created expressly for him. He was a member of the Public Health Association, and American Medical Association, a corresponding member of the Boston Gynecological Society and of the Philadelphia Academy of Natural Sciences. He was a contributor to scientific periodicals and the author of "Medical Statistics of the Provost Marshal General's Bureau." On August 16, 1890, he was appointed Surgeon-General of the United States Army in the place of Surgeon-General Moore, retired. His friends had frequently urged his appointment to the office whenever a vacancy occurred, and when Surgeon-General Barnes died in 1881 he was promised the post, but lost it through the assassination of President Garfield.

BEACH, William M., was born in Amity, Ohio, May 10, 1831, and died near London, that State, May 5, 1887. After receiving an academic education at Ohio Wesleyan University, he attended Starling Medical College, Columbus, Ohio, from which he was graduated M. D. in 1853, and practiced his profession at Unionville and Lafayette of his native State until the beginning of the civil war. He enlisted with the Seventy-Eighth Ohio Volunteers, and was assistant surgeon of this regiment until 1864, when he was transferred to One Hundred and Eighteenth Ohio Volunteers in the Twenty-third Army Corps, Army of the Tennessee, serving until the close of the war. During the Vicksburg campaign he was the hospital director of Gen. John A. Logan's division, and was one of the surgeons constituting the Division Operating Board. After the war he resided on his farm in Madison county, Ohio, practicing his profession there until his death. He was a member of the Legislature and was the Republican candidate for lieutenant-governor in 1873. Dr. Beach was also a member of the principal medical societies of his State, was the first president of the Ohio Sanitary Association and was president of the Ohio State Medical Society in 1885. He

served in this capacity for other medical organizations and has contributed valuable papers to their proceedings, which have been extensively published in medical journals. Among these was one on "Milk-Sickness," which was read before the American Medical Association and subsequently published in the "Reference Hand Book of Medical Science."

BEALE, Joseph, of the United States navy, was born in Philadelphia, December 30, 1814, and died there, April 23, 1889. He was of mixed English and Scotch-Irish extraction. He received his classical and medical education in the University of Pennsylvania, graduating M. D. in 1836. He settled in Philadelphia, where he practiced for one year and then entered the United States navy as assistant surgeon. He rose to the position of surgeon-general of the navy, to which he was appointed in July, 1873. He was retired from active service in February, 1877, with rank of commodore. He served during the war of the rebellion, in the blockade of Charleston, Savannah and Mobile, and participated in the naval engagements and capture of forts Hatteras and Clark, North Carolina, and the forts of Port Royal, South Carolina. During his career in the navy he was on sea duty seventeen years and one month, on shore or other duty sixteen years and seven months, and was unemployed four years and eight months.

BEARD, George Miller, of New York, was born at Montville, Ct., May 8, 1839, and died January 23, 1883. His father, the Rev. S. F. Beard, was a Congregational clergyman of New England. His grandfather was a physician. He prepared for college at Phillips' Academy, Andover, Mass., under the late Dr. Samuel H. Taylor, and entered the academical department of Yale in 1858, graduating in 1862, after which he studied one year in the medical department of Yale, and in 1866 graduated at the College of Physicians and Surgeons, New York, in which city he at once settled, devoting himself, in connection with Dr. A. D. Rockwell, to electro-therapeutics, which, with nervous diseases, constituted his specialty. He was a Fellow of the New York Academy of Medicine; member of the New York County Medical Society; of the Kings County Medical Society; of the New York Society of Neurology; of the American Medical Association; of the American Neurological Association; and of the American Association for the cure of Inebriates. He published in 1866 a paper on "Electricity as a Tonic," and in 1867, with Dr. Rockwell, a work on "The Medical Uses of Electricity, with Special Reference to General Electrization," and in the same year a paper on "The Longevity of Brain Workers," in which it was demonstrated that those who live by brain live longer than those who live by muscle, and that great men live longer on the average than ordinary men. In 1868, he translated from the German, and edited, with an introduction, Tobold's "Chronic Diseases of the Larynx;" in 1869 published a popular work for the family, entitled "Our Home Physician;" in 1871, with Dr. Rockwell, a work on "Medical and Surgical Electricity," which was translated into the German by Dr. Väter; and in the same year two popular treatises entitled respectively, "Eating and Drinking," and "Stimulants and Narcotics," and also a paper on "Electricity and the Sphygmograph," wherein was ex-

plained the method of central galvanization; with Dr. Rockwell a paper on "Galvanization of the Sympathetic;" in 1872 a paper on "Recent Researches in Electro-Therapeutics," and one on "Electricity in Diseases of the Skin;" in 1873, with Dr. Rockwell, a monograph, entitled "Clinical Researches in Electro-Surgery;" a paper on "Atmospheric Electricity and Ozone; their Relation to Health and Disease;" in 1874 a monograph on "Legal Responsibility in Old Age, Based on the Author's Researches into the Relation of Age to Work," founding in the same year a semi-annual journal, *The Archives of Electrology and Neurology*, which continued two years, and also beginning the study of physiology and pathology of delusions, and explained the performances of the Eddy brothers, and Brown, the mind-reader; in 1875 published a paper on "The Relation of the Medical Profession to Popular Delusion of Animal Magnetism, Clairvoyance, Spiritualism and Mind-Reading," and also, with Dr. Rockwell, a revised and enlarged edition of "Medical and Surgical Electricity;" in 1876 a work on "Hay Fever, or Summer Catarrh," based on original researches, and advocating the nerve theory of that disease, and in the same year a paper on "New Facts and Suggestions Relative to Hay Fever;" in the same year published a paper on "The Causes of the Recent Increase of Inebriety in America;" and in 1877 a monograph on "The Scientific Basis of Delusion, Being a new Theory of Trance and its Bearing on Human Testimony," with one on "Mental Therapeutics, or the Influence of Mind in the Causation and Cure of Disease;" and a paper on "The Physiology of Mind-Reading;" also a paper on Writers' Cramp, its Nature, Symptoms and Treatment," and a paper on "Practical Points in the Electrolysis of Cystic and Fibroid Tumors," and in 1879 a monograph on "The Scientific Study of Human Testimony and Experiments with Living Human Beings;" "The Psychology of Spiritism;" "The Results of a Long Study of Writers' Cramp." In 1880 he contributed a monograph on the "Problems of Insanity," and a systematic treatise on "Nervous Exhaustion (Neurasthenia)," also a work on "Sea Sickness, its Nature, and Treatment," and other valuable papers. From 1863 to 1864 (eighteen months), he was Acting Assistant Surgeon in the United States Navy, in the western gulf squadron. In 1868 he was lecturer on Nervous diseases in the University of New York; and from 1873 to 1876, Physician to the Demilt Dispensary, in the department of electro-therapeutics and nervous diseases. Dr. Beard gave much attention to the functional nervous disease known as inebriety, and published papers making clear the distinction between the vice of drinking and the disease and indicating the treatment by sedatives and tonics. He also delivered popular lectures on psychological and neurological subjects.

BECK, John B., of New York, was born at Schenectady, N. Y., September 18, 1794, and died in New York City April 9, 1851. When seven years of age he left his home to reside with his uncle, Rev. John B. Romeyn, then pastor of the Reformed Dutch Church in Rhinebeck, New York. Here he began his classical studies, encouraged by the kindness and scholarship of his noted relative. In 1804 Dr. Romeyn removed to New York City, his

nephew accompanying him. Here the young man's education progressed under the same judicious care. In 1809 young Beck entered Columbia College, and his industry and ability soon secured him the warm approbation, and in due time the cordial friendship, of the celebrated John M. Mason, D. D., the provost of that institution. In 1813 the subject of this sketch graduated with the highest honors of his class. He ever retained a kindly feeling for his *Alma Mater*, and when in after years it manifested its appreciation of his general ability by appointing him one of her trustees, he took an active part in every effort to sustain and elevate her reputation. Immediately after his graduation young Beck went abroad, and spending some time in London, he there applied himself to the study of Hebrew. In this study he made such advances as to enable him in after life to take an intelligent interest in Biblical criticism. On his return from England, having determined to study medicine, he entered the office of Professor David Hosack, of whom he soon became a favorite pupil. In 1817 Dr. Beck graduated at the College of Physicians and Surgeons, New York, presenting as his thesis that treatise on infanticide which subsequently incorporated into the great work on Medical Jurisprudence, by his brother, T. Romeyn Beck, laid the foundation of his fame as an author. It may be truly said that, in this treatise, the subject was so thoroughly presented that subsequent writers have done little more than reproduce copies, more or less imperfect, and that it is still the standard work on infanticide in the English language. In 1822, Dr. Beck aided in establishing the *New York Medical and Physical Journal*. To this journal he devoted a large portion of his time, and in it were published many able articles from his pen. Among them may be specially mentioned his paper on Laryngitis, several reviews on the Contagiousness of Yellow Fever, a favorite doctrine of his great teacher, Hosack, and then the leading *questio vexata* of medical science, and others on the *Modus Operandi* of Medicines, in which the doctrine of their absorption into the blood was ably sustained. "In 1820 he was elected professor of *Materia Medica* and Botany in the College of Physicians and Surgeons of New York, then newly organized in consequence of the simultaneous resignation of all the previous faculty. This step, the crowning act of a long series of dissensions, thrust upon their successors a weight of responsibility difficult to bear. The names of Post, Hosack, Mitchell, Mott, Macnevin and Francis were known throughout the country. The whole influence of these names was thrown against the organization, and it had in its very inception to struggle against the imputed odium of having driven those distinguished men from positions they adorned. Of this responsibility Dr. Beck was prompt to take his full share, and his ability as a controversialist was too well known, and had been too sorely felt, not to insure to him a full share of any odium which the friends of the old could throw on the leaders of the new organization. But it was not alone against the influence of names that the school had to struggle; active rivalry was soon attempted, and a new medical school—the Rutgers Medical College—was organized with Hosack, Mott, Macnevin and Francis in their old departments, while the

places of Post and Mitchell were filled by John D. Godman and Dr. Griscom." In the rivalry no man did more than Dr. Beck to sustain the reputation of his college. In his own department he was impregnable; of those, and there were many, who desired that he should fail as a public teacher, few expected it, and those few were miserably disappointed. His success from the first was signal, and his popularity as a lecturer went on steadily increasing till the close of his career. In 1835 he was appointed one of the physicians of the New York Hospital, a situation he filled for ten years, discharging his duties with fidelity and zeal. His services at the hospital had a very favorable effect on his reputation as a practitioner. Hitherto Dr. Beck had been known as a learned physician, a practiced and able writer, and a judicious and attractive lecturer. At the hospital he proved himself no less sagacious in investigating disease at the bedside, than skillful in the application of remedies to its cure. Dr. Beck aimed to be judicious in the use of a few remedies, and did not attempt to overwhelm disease by a multitude of them. While thus applying the fruit of previous study for the relief of the sufferer at this great public charity, he did not lose the opportunity of giving the students and young physicians connected with the establishment those clinical lessons which are of the most practical value. His clinical instruction was like all his public teaching, distinguished by great simplicity of language, clearness and a devotion to utility rather than show. In 1843 he collected together, and published in a volume, a few of the most important of his contributions to periodical medical literature. In 1849, his work on "Infantile Therapeutics" appeared, and was received with the greatest favor, both at home and abroad. Few medical books of its size contain an equal amount of sound learning and practical good sense. Dr. Beck enjoyed in an eminent degree the respect and confidence of his professional brethren. Of this he received continued proofs from the commencement to the close of his professional life. He was elected, when a very young man, trustee of the College of Physicians of New York, and censor of the County Medical Society. He held at subsequent periods the offices of vice-president and president of the Tapler Medical Organization, and then became president of the State Medical Society of New York, before which he delivered an inaugural address, on the "History of American Medicine Before the Revolution," which was afterward published, and amply sustained his well-earned reputation. He took an earnest interest in the organization of the New York Academy of Medicine, and was early elected one of its vice-presidents, and subsequently orator to the Academy. This was the last opportunity his professional friends enjoyed of manifesting their unabated respect for him and regrets as sincere as general were felt that his failing health compelled him to decline the duty he would, under more favorable circumstances, have performed with his eminent ability. One of his biographers, Dr. C. R. Gilman, in a survey of the intellectual character of the subject of this memoir, says the first quality that deserves special notice was *energy*; in this he had few equals; an end being set before him he pursued it with vigor, a steadiness of purpose, and a force of will

which rarely failed to command success. Another trait, which was very marked in him, was clearness of perception; he saw the object to his mind's eye with all the distinctness of the most perfect physical vision. This quality was undoubtedly the secret of much of his success as a practitioner of medicine, and a medical writer and a public teacher. He saw disease just as it was; theories never distorted nor did prejudice obscure it; all was clear and perfectly distinct from every other object. Having this quality in so eminent a degree and being both in the English and the classics a thorough scholar, he could not fail as a teacher to communicate in words a just and accurate idea of the object before him. So in argument and controversy, he saw the question to be discussed, or the point in dispute clearly. He thus united in a degree, quite peculiar to himself, the qualities often seen apart, that made him as a public teacher both useful and popular. His lectures were clear, precise, and singularly practical; no merely specious theories, no rash generalizations, no loose assertions found place there; all was logical, accurate, true. The qualities and the ready courtesy with which when the lecture was over he answered the questions and solved the doubts of the students, his happy faculty of removing by repeated and varied illustrations the difficulties in the way of their perfect comprehension of a subject, gained a very strong hold on the respect and affection of his classes, and secured entire and implicit confidence. The personal character of Dr. Beck was of a very high order; a steady adherence to principle, an ardent love of truth, an unhesitating, unwavering, almost instinctive preference of the right over the expedient, marked him in the best and highest sense of the words as a man of honor, and it is delightful to think, says the biographer last quoted, that these qualities were adorned and harmonized by the graces of a sincere and consistent Christian. Of his faith and patience a long and hard trial was made by an illness protracted during many years, and attended by sufferings nearly constant and often agonizing. This was so unremitting and so long continued, that some months before his death he is quoted as saying that for five years he had not been free from pain for one single half hour. "He derived at one time some relief from the use of anæsthetics and opiates, but towards the last was unwilling to use them. "I do not wish," said he to a medical friend, "to die stupified or insane. He desired to look the king of terrors full in the face and watch with steady eye his slow approach. Meanwhile, it is said, his sufferings seemed at times to have no other limit than the capacity of the system to the sensation of pain, and were so intense as to induce his best friends to pray for his early release. At last human nature could endure no more, but without repinings to disturb the calm serenity of his soul, the gracious messenger came and set him free.

BECK, Theodric Romeyn, of Utica, N. Y., was born at Schenectady, N. Y., August 11, 1791, and died in the former city November 19, 1855. He was a brother of Drs. John B. Beck and Lewis C. Beck, both physicians of eminent medical attainments. His father, Caleb Beck, died during the childhood of the subject of this sketch, and

from that period the care of his education, and that of his brothers, rested chiefly with his excellent mother, who was the only daughter of the Rev. Theodric Romeyn, D. D., long the Principal of the Academy of Schenectady, and one of the most active founders of Union College. Referring to the subject of this sketch, the late Dr. Frank H. Hamilton writes in the "American Medical Biography" as follows: "The rudiments of Dr. Beck's education were acquired at the grammar school of his native city, under the more immediate supervision of his maternal grandfather. He entered Union College, at Schenectady, in 1803, and was graduated in 1807, when only sixteen years old. Immediately after this he went to Albany, and was admitted to the office of Dr. Low and Dr. McClelland. His medical education was completed, however, in the city of New York, under the personal instructions of Dr. David Hosack. At the same time, also, he attended the lectures at the College of Physicians and Surgeons in that city; and in 1811 he received the degree of Doctor in Medicine, on which occasion he presented, as the subject of his inaugural thesis a paper on "Insanity"—the first fruits of the study of that subject which afterwards engaged so large a share of his attention, and upon which he expended such stores of learning, and exhibited such powers of research. The thesis was published in a pamphlet form, containing thirty-four pages, and received from various quarters highly flattering notices. On his return from New York, he commenced at once the practice of medicine and surgery at Albany, and the same year he was appointed physician to the almshouse. On resigning this office, he presented a memorial to the supervisors on the subject of work-houses, the practical wisdom of which daily experience proves at this time. Dr. Beck was married in 1814, at Caldwell, Warren county, New York, to Harriet, daughter of James Caldwell. In the year 1815, at the age of twenty-four, he received the appointment of Professor of the Institutes of Medicine, and of Lecturer on Medical Jurisprudence, in the College of Physicians and Surgeons for the Western District, established under the auspices of the Regents, at Fairfield, in Herkimer county, New York; an institution then in the third year of its existence. Notwithstanding this appointment, which required his absence from home only a small portion of the year, he continued in the practice of his profession at Albany. At the opening of the term in 1824, Dr. Beck delivered an introductory lecture on the "Advantages of Country Medical Schools," which was published by request of the class. The subject had been suggested by a remark made in an introductory lecture by one of the professors in New York, disparaging to country schools, and which had found its way into some of the New York prints, to which this discourse was a severe, but dignified and dispassionate reply." Already, in 1817, Dr. Beck had withdrawn entirely from the practice of medicine, having in this year accepted the place of Principal in the Albany Academy. His success in his profession had been quite equal to his expectations, and with less devotion to science, or with less care for his patients, he might have continued in practice. But it was soon manifest, both to himself and to his friends, that he could not long bestow equal attention upon both. He was

unwilling to assume the responsibilities of a physician without devoting to each case that exact amount of careful investigation which his high standard of fitness demanded. Every new feature in disease provoked, in a mind trained to accuracy and observation, new solicitudes, new doubts, and claimed new and more thorough examinations. Added to this, the scenes of suffering which he was compelled to witness were gradually upon a frame naturally sensitive, and his health began visibly to decline. At first, one must naturally regret that a mind so well stored, and so eminently qualified, in many respects, to minister successfully to the sick, should have been diverted thus prematurely from its original purpose. It would be difficult to measure the amount of good which, as a practitioner of medicine, he might have accomplished; how much individual suffering such talents might have alleviated, and how many valuable lives such attainments might have saved. This is a loss which the citizens of his adopted town, and of the country adjacent, have chiefly sustained, and which they must estimate. "It is a question to them," writes Hamilton, the biographer previously quoted, "whether he made himself as useful as a teacher as he might have been as a physician; but I believe they will be slow to find fault with his choice, when they have carefully figured up the account, and have balanced the reckoning. In fact, I think that in the fame alone which his illustrious name has given to their city, they must find an adequate apology and compensation for all his apparent neglect of their physical sufferings. But this would be indeed only a narrow view of the question upon which the young, and, I have no doubt, conscientious Beck, assumed thus early the right to decide for himself." Although Dr. Beck formally, at this time, relinquished the practice of medicine, and never again resumed it, yet his interest in the science did not cease; but to the improvement and perfection of some one or another of its departments, the balance of his life was, in a great measure, devoted, and especially to such portions as were of general or of universal interest. He seemed, in fact, to have called in his attention from a narrow range of objects, only that he might fasten it again upon a much wider. He withdrew himself from the almshouses and the jails, in which the unfortunate maniacs were treated rather as criminals than as proper objects of sympathy and of medical care, that he might, in the retirement of his study, within which he had accumulated nearly all the experience of the world, devise the more unerringly the means of unfettering their intellects and their limbs, then so cruelly chained. In a letter to his uncle, Dr. Romeyn, then in Europe, dated June 30, 1814, he says: "I have begun to look upon medicine in a very different manner from what I formerly did. Although delighted with the study, yet I dislike the practice, and had not acquired sufficiently comprehensive views of its value and great importance as an object of research. I now find it a subject worthy of my mind, and for some time past I have brought all my energies to its examination." From this remarkable passage, in which we have definitely the plan of his future life, we learn also what enlarged and intelligent views he entertained of the

value of true medical science. In 1829, Dr. Beck was appointed President of the New York State Medical Society, and he was re-elected the two succeeding years—in itself a sufficient testimony of the esteem in which he was held by his fellow-members. His first annual address was devoted mainly to the subject of "Medical Evidence," which he regarded as embracing not only the interests of the profession, but of the community generally. In this address, he urges the propriety of appointing in certain counties, districts, or parts of the State, medical men who shall be especially charged with the duty of making the examinations upon the cadaver, in order that by experience and study they may become better fitted for the performance of this important duty. In all cases, he believed the medical witness ought to be permitted to present a "written report" of his examination, and not be required to give it verbally and without sufficient preparation. Nor could Dr. Beck see any good reason why, if such services are important to the community in promoting the proper administration of justice, the medical men who render them are not entitled to receive an adequate compensation. "There is not," he says, "an individual attending on any of our courts, who is not paid for his time and services, with the exception of such as are engaged in these investigations." In his second annual address, he calls the attention of the society to the rapid progress of the science of medicine, especially in its growing distrust of mere theories, and in its devotion to pathology, anatomy, chemistry, materia medica, and the collateral branches. In defense of those who pursue the study of anatomy, he utters the following just sentiment: "All will grant their pursuit would not have been selected except from a high sense of duty. It requires some lofty incitement, more moral courage to be thus employed. The mysterious change which death induces is alone sufficient to startle the most buoyant spirit; but with this the pathologist must familiarize himself. He proceeds to his high office at the risk of health, often, indeed, of existence." As a theme for his last annual discourse, Dr. Beck selected the subject of small-pox as one of "permanent and abiding interest, not only to us as medical men, but to the whole community, indeed to the whole human race." This paper consists mainly of a rapid history of the origin and progress of this terrible scourge, and of the value and necessity of thorough vaccination, with a view to its ultimate extinction. Dr. Beck continued to feel an interest in, and to cultivate laboriously, the science of medicine until a late period of his life. Selecting always those themes for his discourses which were of the largest interest to the largest number, he was able to discuss them in a manner which indicated an intimate acquaintance with all their relations and bearings. His suggestions were constantly such as might become a physician, a philanthropist and statesman; and that they were not utopian is proved by the fact that very many of them, either in their original forms, or only slightly modified, have been adopted as measures of state policy and general hygiene, or, if not adopted, they still continue to commend themselves to the intelligence of enlightened men everywhere, and physicians still continue to reiterate his sentiments, and

to urge their adoption upon those who have the care of the public interests. In 1826, Dr. Beck was made Professor of Medical Jurisprudence, at Fairfield Medical College, instead of lecturer; and in 1836 he was transferred from the chair of Practice to that of Materia Medica, in accordance with his own request. These two chairs he continued to occupy until the abandonment of the college in 1840. Medical schools had been established both at Albany and Geneva, under new and favorable auspices, each having received liberal endowments from the State; and although the college at Fairfield still retained the confidence of the profession to such a degree that in its last catalogue its pupils numbered one hundred and fourteen, and its graduates thirty-three, yet as it was apparent that the wants of the community did not require three colleges situated so near each other, and as both Albany and Geneva had the advantage in their relative size and accessibility, it was determined by the several professors to discontinue the lectures at Fairfield. From the rude walls of this college, built upon cold and inhospitable hills, have gone out more than three thousand pupils, and nearly six hundred graduates; of whom nineteen have held, or do now hold, professorships in colleges, eight are in the United States service as surgeons, and very many more have risen to distinction in the practice of medicine and surgery. Immediately on resigning his place at Fairfield, Dr. Beck was elected to the chair of Materia Medica in the Albany Medical College; the chair of Medical Jurisprudence, to which he would most naturally have been chosen, being already occupied by a very able teacher, Amos Dean, Esq. This professorship Dr. Beck continued to hold until 1854, when his declining health, together with an accumulation of other pressing duties, induced him to resign his place as an active officer, having now taught medicine in some of its departments for thirty-nine years, and the trustees then conferred upon him the honorary distinction of emeritus professor. Outside of his own peculiar sphere of duties, no object of public interest was undertaken without finding in him a warm supporter. When the project of a university in the city of Albany was started, intended to supply the scientific and literary wants of the whole United States, Dr. Beck while seeing clearly all the difficulties and discouragements attending such a scheme, gave it his full countenance and encouragement. Of the American Association of Science he was an active member, and rendered to it many services. In obedience to those promptings of humanity which seem in a great measure to have determined his course in life—laboring always most zealously for those who were least able to appreciate his services, or to recognize them—he read before the New York State Society, in 1837, a paper on the statistics of the deaf and dumb, which had the effect to direct the attention of the public and of the legislators more fully to the condition and necessities of this unfortunate class, and the results of which may be seen in the establishment in the city of New York of a school for deaf mutes, unrivalled in the excellence of its system and in the perfection of its details. By the act of its incorporation, in April, 1842, Dr. Beck was made one of the Board of Managers of the New York State Lunatic Asylum at Utica; and

he was reappointed by the governor and senate at the expiration of each successive triennial period. Upon the death of Mr. Munson, in 1854, he, although a non-resident member, was unanimously elected president of the board. This important institution, established and endowed by the State upon a scale of almost unparalleled munificence, is no doubt indebted largely to Dr. Beck for his wise counsels and efficient personal aid, which he at all times freely contributed. Dr. Beck was also an occasional contributor to the pages of the *American Journal of Insanity*, published at Utica, under the editorial management of Dr. Brigham, the former principal, and when, upon the death of that gentleman, in 1850, the management of the *Journal* fell into the hands of the board, Dr. Beck was chosen its editor, a place which he continued to hold "until the close of the last volume, when advancing years and more imperative duties compelled him to relinquish his editorial connection." But of the chief labor of Dr. Beck's life, and that which has made his name illustrious wherever science and literature are cultivated, must now be mentioned his work on Medical Jurisprudence. From how early a period in his life the subject of this work occupied his attention may be inferred from the following brief extracts from letters written to his uncle, the Rev. J. B. Romeyn. The first is dated in 1813: "Permit me to press upon you the obtaining of one or the other of the French authors on legal medicine. It has long been a favorite idea with me to prepare a work on that subject, and should I be enabled to procure Foderé or Mahon, my design may be completed." The second is dated June 30, 1814, and was addressed to his uncle, at Lisbon, Portugal: "As the communication is now open between Great Britain and France, you will doubtless be enabled to procure the books I wished. Dulan advertised them some years since." The treatise alluded to appeared in 1823, in two volumes, octavo; and not only attracted great attention at the time, but has ever since continued to be a standard work on the subject. The science of medical jurisprudence is one of great interest and importance. It treats of all those questions in which the testimony of a medical man may be required before courts of justice, and from the nature of many of the questions, it is obvious that their discussion requires the widest range of medical and scientific knowledge. Although deeply studied in Italy, France, and Germany, this science has scarcely attracted any attention, either in this country or in England, previous to the publication of the work of Dr. Beck. To him is certainly due the high credit, not merely of rousing public attention to an important and neglected subject, but also of presenting a work upon it which will probably never be entirely superseded. In foreign countries, its merits have been duly appreciated and magnanimously acknowledged. In 1825, the work was republished at London, with notes by Dr. William Dunlop, and it passed altogether through ten editions, including the four English editions, during the author's life. Since his death, a new and enlarged edition has been issued under the supervision of Dr. C. R. Gilman, of New York, assisted by an able corps of collaborators. In 1828, the work was translated into German, at Weimar, and has been favorably received in

various parts of the continent of Europe. Considered all in all, it is unquestionably the most able, learned, and comprehensive treatise on Medical Jurisprudence in any language, and may, therefore, justly be regarded as the crowning glory of Dr. Beck's literary and scientific life. Although the two volumes originally comprised more than two thousand pages octavo, yet to each successive American edition he did not fail to add largely from his apparently inexhaustible stores of knowledge and research. Not even here did his labors cease, but he continued to contribute, almost to the period of his death, to one or more of the medical or scientific journals of the country, such additional facts or discoveries as from time to time came to his knowledge. In the *American Journal of the Medical Sciences*, edited by Dr. Hays, may be found many of his most valuable papers. There is, perhaps, no testimony more pertinent, as to the rank occupied by Dr. Beck in the literary and scientific world, than the large number of societies, both abroad and at home, which conferred upon him either honorary or active memberships. To the inquiry, so natural to one who reflects upon the life and labors of Dr. Beck, "How has any man been able to accomplish so much in a single life?" The reply is,—it was the result of system, indomitable perseverance, of ardent devotion, and honesty of purpose, united to excellent talents. But no one quality so much contributed to his extraordinary attainments as that methodical improvement of time which he adopted from the first and retained to almost the last hours of his life. Every duty had its time and place, with which no other duties were allowed to interfere. A given portion of each day was assigned to a particular subject, and this arrangement was not to be interfered with. The morning study was never postponed to the evening, nor relaxation nor miscellaneous reading permitted until the allotted tasks were respectively dispatched. Having determined also upon any great purpose, it was never relinquished until it was accomplished. With him there was no vacillation or uncertainty of design; and at his death nothing seems to have been left unfinished, but that one labor which he had undertaken too late for its full completion,—a memoir of his early friend and counsellor, the lamented De Witt Clinton; a work for which his long and intimate acquaintance, his sympathy of feelings and tastes, with his rare literary attainments, eminently qualified him. To his wife, who died in 1823, at the early age of thirty-one years, a woman of rare accomplishments and of refined sentiments, he was devotedly attached; and it is said that the greater part of his work on Medical Jurisprudence was written while watching at her bedside during her last and painfully protracted illness,—a most touching memorial to her virtues and to the kindness of his own heart. Of his brothers, he was the eldest; and, although accustomed always to exercise over them a kind of parental care, he was singularly attached to them; and when, one after another, they died, until he alone was left, he seemed to suffer the most poignant grief; especially did the death of his last and youngest brother—the late Lewis C. Beck—with whom his associations and pursuits were the most constant, fall heavily upon him.

His mother—that venerated woman, who herself had watched over his infancy, and guided him carefully through his youth, up to manhood—found under his roof a welcome shelter in her declining years, where at all times her wants were more than supplied, and her counsels and precepts were reverentially respected. Brought up under her father's care, her education was solid and judicious, and, until the last three or four years of her life, when her mind gave way, she preserved her interest in all literary pursuits. She lived to see all her children attain eminence and respectability, and died at last at the advanced age of eighty-five years. Referring to his personal characteristics, the late Dr. Frank H. Hamilton writes that in the presence of strangers Dr. Beck was somewhat reserved, and not unfrequently seemed unsocial; but, with his more intimate acquaintance, he was remarkably free, affable, and unrestrained; and through all his familiar social conversations there was a rich vein of humor mingling with the profounder currents of thought and discussion. His knowledge of books was not confined to scientific treatises. He read most of the standard works in history, romance, poetry, and in all departments of light literature. He read rapidly, and soon possessed himself of the meaning or value of any author; a faculty which, united to a retentive memory, made him almost the final umpire whenever questions of text or authority arose. In the language of one who knew him intimately, and who had been a collaborer with him in the establishment of the State Library, "His knowledge of what I would call the science of literature, I have never seen equaled." He was liberal to the poor, and kind to all. Not even the brutes escaped his sympathy. Cruelty to animals excited in him always the most intense disapprobation. His belief in the divine revelation, and in its doctrines, as held by the great body of Protestant Christians, was firm, decided, and often expressed; and he could never tolerate any attempts on the part of any person to impugn or to throw discredit upon them.

BEHRENS, Bernt Martin, of Chicago, Ill., was born September 25, 1843, in Bergen, Norway. Received his preliminary education at Christiania, with the intention of becoming officer of the army, but had to give it up on account of a long sickness after typhoid fever. Entered upon the study of classics in Greek and Latin for admittance to the university and passed examination with honors in 1868. Under the preceptor, Johan Voss, the distinguished professor in medicine, he graduated in 1875, was the same year in service at the State Hospital, and moved thereafter to Bergen, his native place, where he practiced his profession until 1881, when he left his native country for America. He settled down in Chicago, where he has been practicing since. For supplementing his medical education, he visited the principal seats of learning in Europe, in the winter of 1876 to 1877, and in the summer of 1887, and studied with Professors Pollitzer, Schroeter, Von Spaeth, Shade, Knester, Hahn and Wilk Meyer, in the cities of Vienna, Hamburg, Berlin and Copenhagen respectively. He was a member of the Chicago Medical Society for eight years; American Medical Association for four years; Scandinavian Medical Society for four years, of which

he was chairman for two years. In 1890 to 1892 he made several contributions on diseases of ear, nose, and throat, and was in 1891 ap-

B. M. Behrens.

pointed Professor of Diseases of the Ear at the Chicago Post-Graduate School. His wife is the celebrated soprano, Miss Anna Smith, of Christiania, Norway.

BELL, Agrippa Nelson, of Brooklyn, N. Y., was born in Northampton county, Va., August 3, 1820. His parentage, English and Scotch. Education: common school in Virginia, academic and classical in Connecticut. Has received honorary degree of A. M. from Trinity College, Hartford. He studied one year in the Tremont Street Medical School, Boston, taking a first course of lectures at the Medical Department of Harvard University, and a second course at Jefferson Medical College, Philadelphia, where he graduated in 1842. He first settled at the village of Franktown, Northampton county, Va., from which place he applied for permission to be examined by the naval board of examiners; passed the greater part of the year 1844 in New York, and his examination for the navy being a successful one (November, 1844), he received the commission of assistant surgeon, in March, 1847. Intermediately he resided and practiced in Waterbury, Conn. During 1847 and 1848 he was on active duty, during the Mexican war, in the vicinity of Vera Cruz, serving in several vessels in the squadron and also on shore and at the Yellow Fever Hospital on Salmadina island. His subsequent naval service was one year on the coast survey, in New York harbor and bay; in the West Indies; Central America; and west coast of Africa. He passed an examination for promotion in 1854, and after being nearly two years on board the receiving ship at New York, resigned from the navy, 1855, and entered upon private practice in Brooklyn. He is an active member of the Kings County Medical Society (Brooklyn); of the New York Academy of Medicine; permanent member of the Medical

Society of the State of New York; American Association and American Public Health Association; was an active member of the National Quarantine and Sanitary Conventions in 1859 and 1860, and chairman of the committee on quarantine regulations, whose report at the convention in Boston in 1860 has been the basis of most of the quarantine regulations in the United States and abroad since. He has always given special attention to sanitary matters. During the first year of the rebellion he had charge of the floating hospital for yellow fever patients under quarantine in New York harbor, and drafted the law for the New York quarantine establishment as it is now and has been since 1863. He has been member of nearly all of the New York and Brooklyn committees which have been appointed on health reforms and for the establishment of boards of health—the metropolitan, and others. He also held the position of quarantine commissioner and supervising commissioner of the construction of quarantine buildings from 1869 to 1873. Since 1856 has been one of the physicians of the Brooklyn City Hospital, being now senior member of the medical staff. For many years he has been chairman of the standing committee on hygiene of the New York State Medical Society, and took the first "Meritt H. Cash prize" of that society in 1864, on "How Complete is the Protection of Vaccination, and what are the Dangers of Communicating Other Diseases With the Vaccinia?" He has also contributed several papers to the Transactions of the society on sanitary subjects, viz: "Malignant Pustule," 1862; "Disinfection," 1864; "Marine Hygiene," 1867; "Marine Hygiene and Experiments with Steam as a Disinfectant," 1868; "Quarantine Establishment of New York," contributed in 1873, but not published till 1875; "Defective Drainage," 1874. The latter paper was ordered to be printed by the society as a separate paper from the Transactions, and was sent by the society to every physician in the State of New York. It was printed in full in the *Sanitarium* in March, 1874. He has contributed the following to the Transactions of the American Medical Association: on the "Introduction of Disease by Commerce," volume xvi, 1865; he was chairman of the committee report, same year, on "Protection from Small-Pox by Means of Vaccination and Revaccination." He was the first chairman of the section on State medicine and public hygiene of the association, 1873 and 1874; the subject of his address was, "Waste of Life," and report on "Defective Drainage as a Cause of Disease in the State of New York," volume xxv, 1874. To the proceedings of the American Public Health Association he has contributed papers on "Perils of the School-room," and the Hygiene of Passenger Vessels in Communication with New York." He is author of a work entitled "Knowledge of Living Things," published in 1860, now out of print. In 1873 Dr. Bell established the *Sanitarian*, a monthly magazine devoted to the preservation of health, mental and physical culture, and has been the editor of this excellent periodical for the last twenty years.

BELL, Guido, of Indianapolis, Ind., was born September 4, 1839, in the Granddukedom of Baden, Germany. After the ordinary education required, he studied medicine in

Tubingen and Freiburg, from 1859 to 1864. He was graduated in Freiburg in 1865, and came to this country the same year, and established himself at Indianapolis, where he has been engaged in a large and successful general practice of medicine and surgery ever since. Dr. Bell has improved the methods of performing several surgical operations, among which may be mentioned, 1. The supra-pubic section for stone, by sewing up and discarding the catheter (before the antiseptic time); 2. That of intubation by discarding the "gag" in non-asphyctic cases, and by allowing the finger to meet the rising glottis the catheter is dispensed with entirely; 3. In perineorrhaphy, by devising the perineal speculum, which retains and adjusts itself by automatic action, thereby making assistants unnecessary. Dr. Bell recently reported his discovery of a rare and peculiar sound of the heart in cases of shock, which was audible at a distance of several feet from the patient. This peculiar and unusual sound was detected in three cases, and was systolic in character. The sound did not appear immediately after the injury, but according to the severity of the shock later, and more forcibly, gradually disappearing after recovery from the condition. He states that all the cases presenting this phenomenon recovered, and concludes that the heart's action is governed mainly by the cardiac ganglia, and cites the above pathological condition coming under his clinical observation, as well as facts from embryology and comparative anatomy to prove that the innervation of the heart is in a high degree independent from the brain and the spinal cord. Dr. Bell has made important contributions to medical periodicals, both in this country and Europe. In the *Indiana Medical Journal* (June, 1893) is found an interesting article from his pen, "On the Internal Use of Creosote in Large Doses." He advocates in this paper the use of this agent in doses aggregating twenty drops daily, as being curative in pyemia, chronic suppurative diseases, and as a preventive of a possible tubercular affection. Dr. Bell is a member of the judicial council of the Marion County Medical Society, and was president of this society from 1891 to 1892. He is also a member of the Indiana State Medical Society and a permanent member of the American Medical Association.

BELL, John W., of Minneapolis, Minn., was born in Butler county, Ohio, March 18, 1854. He graduated from the Ohio Medical College in 1876, and later spent some time studying medicine in foreign schools, mainly in Germany. He practiced his profession in Reily, Ohio, until he came to Minneapolis, Minn., in 1881. In 1886, he was appointed Professor of Theory and Practice of Medicine in the Minnesota Hospital College. Upon the opening of the Medical Department of the University of Minnesota he was elected to the chair of Physical Diagnosis of the Chest. In 1891 he became professor of clinical medicine and physical diagnosis in the same school. In 1883 he was appointed visiting physician to St. Barnabas Hospital—later, consulting physician. On the opening of St. Mary's Hospital, in 1887, he was appointed visiting physician. In 1892, on the opening of the Methodist Hospital, he was appointed one of the visiting physicians. He was a member of the Minnesota State Medical Society, of the

John W. Bell.

Minnesota Academy of Medicine, and the Hennepin County Medical Society. In addition to the practice of his profession, Dr. Bell has taken a warm interest in public affairs, and in 1890 was elected a member of the State senate.

BENJAMIN. Dowling, of Camden, New Jersey, was born in Baltimore, January 23, 1849, and comes of an old Southern family distinguished for patriotism from the revolutionary war to the present time. After receiving a thorough common school education he was prepared by private tutors for the sophomore class in Dickinson College, Pa. He graduated in pharmacy in Baltimore in 1873, and began the study of medicine in 1871, with Dr. J. H. Jannar, Port Deposit, Md., afterwards with J. M. Ridge, Camden, N. J., and later with Prof. D. Hayes Agnew, Philadelphia. He graduated at the University of Pennsylvania, at the head of the '77 class, having answered all the questions (over three hundred) in all branches. Received also honorable mention at the commencement exercises for his thesis on contagion or "Germ" diseases. Dr. Benjamin urged the adoption of higher grade practical teaching in colleges of pharmacy in 1876 (see transactions of American Pharmaceutical Association), which was adopted by the Philadelphia college the following year. Representing the State of New Jersey in the American Medical Association at Washington in 1884, he succeeded (after a stormy debate) in having his resolution adopted to advance instruction in medical colleges in America from a two term course to a third year course, a much needed reform (see *Journal of American Medical Association*). In 1877 he was appointed assistant in the nervous department at the University hospital; performed the first successful hysterectomy in the State of New Jersey for a large fibroid tu-

mor of the uterus. In 1887 he was appointed Surgeon to Cooper Hospital, Camden; and Lecturer on Fractures and Dislocations in the Medico Chirurgical College, Philadelphia, in 1890, the same year becoming the President of the New Jersey Sanitary Association; his article on "The Relations of Temperatures to Health in Dwellings," being deemed so valuable and practical that copies were sent out by the State of Iowa for free distribution, the State board of health stating officially that it would save many lives (report S. B. H. 1887); other States also adopted the same plan. He was appointed Surgeon to the Sixth Regiment Corps, N. J., in 1891; was elected to the chair of Surgical Teaching in the Camden Training School for Nurses, and is considered a fluent lecturer. It should be said that the great reputation of the subject of this sketch as a physician and surgeon has been acquired by the merits of his work. Dr. Benjamin is also noted for making valuable contributions to medical science and literature during the past few years, some of which may be found in such journals as the *Medical and Surgical Reporter*, *Medical Bulletin*, *Medical Record*, N. Y., and *Journal of the American Medical Association*, etc.

Dowling Benjamin.

BENSON, John Alfred, of Chicago, Ill., was born in Hudson county, State of New Jersey, in 1859, and is a member of an old Knickerbocker family, his ancestors having belonged to the original Holland colony that settled New Amsterdam (now New York) and Communipaw, New Jersey. His father was the late Dr. David Benson, of Hudson county, New Jersey, an authority on electro-therapeutics, under whom he studied the rudiments of medicine, finishing his medical studies at the College of Physicians and Surgeons of New York (Medical Department of Columbia College), graduating from that institution of learning in the year 1880. Having successfully passed the government examination

scientific societies, among them being the immediately after graduation, he was commissioned as a medical officer in the United States marine hospital service, remaining in the service until 1885, when he resigned to enter civil practice in Chicago, Illinois, and was at once elected Professor of Physiology in the College of Physicians and Surgeons, of Chicago, which chair he now holds. While in the marine hospital service, on duty at the port of St. Louis, Mo., a very severe epidemic of small-pox broke out, and he was detailed for quarantine work in connection with the steamers arriving and departing daily from that city. He performed the duties of this department so efficiently, that in a letter from Captain John P. Keiser, he received the thanks of the Anchor Line Steamers Company. In addition to his physiological work in the College of Physicians and Surgeons of Chicago, he has successfully taught obstetrics and medical jurisprudence, and when, during the session of 1892, Professor Quine found that his health would not permit him to continue and finish the course on "Principles and Practice of Medicine," he selected Professor Benson to act in his place, and the correctness of his choice was proven by the results. While at college Dr. Benson had rare advantages in having been closely associated with some of the greatest lights of the nineteenth century. He was an office student of the eminent surgeon, Professor Thomas M. Markoe; was assistant to the distinguished and learned James W. McLane, professor of Obstetrics, and now president of the Medical Department of Columbia College, in New York; and for several years he was special assistant and chief of laboratory to Professor John Call Dalton, one of the greatest authorities on physiology, and one of the most celebrated physicians of the age. While with Dr. Dalton, he assisted this great author in the preparation of his magnificent work on the "Topography of the Brain." In 1888 he was appointed attending physician to the Cook County Hospital, elected secretary of the medical staff, and in 1890 he was unanimously selected by the board of commissioners of Cook county to take charge of the County Hospital for the Insane, a position which he held for two years. He established at that institution many much needed reforms, prominent among these being the Art School for female patients and the School of Manual Art for patients of both sexes. Under his mild and gentle rule, the condition of the patients improved as evidenced by the high percentage of recoveries during his administration. Owing to his fearlessness in defending the rights of the county and preventing dishonest contractors and officials from preying on the treasury, he was annoyed, and his administration crippled in every way possible. Valuable and necessary positions were abolished by the county board; honest and efficient subordinate officers were removed without even the semblance of a trial, and the doctor was harrassed by silly and idiotic investigations, while serious charges made by him against prominent county officials were absolutely ignored. Seeing the futility of attempting to conduct the institution properly under the existing condition of affairs, at the end of his second year of office he declined reappointment, and resumed civil practice. He is a member of a number of

American Anthropometric Society, the American Medico-Psychological Association, the Chicago Pathological Society, is Associate Chief of the Department of Clinical Medicine of the West Side Free Dispensary, and although yet rather a young man, has distinguished himself in the field of neurology and psycho-pathology.

BERK, Carl, of Chicago, Illinois, was born at Milin, in Austria, March 26, 1864, of German parents. His first education was received at the Altstaedter Real and Gymnasium in Prague, where he entered the Medical Faculty of the R. I. University Carolo Ferdinanda and graduated as the first of his classmates in 1889. As a young physician he traveled through Austria, Germany, France and Italy, everywhere stopping at the celebrated universities and attending clinics and lectures. Returning to Prague he entered the Resident Staff of the General Hospital, as assistant to Prof. Schanta, now of Vienna. In 1887 he had served as volunteer in the Austrian army and was promoted to the rank of an officer of the same. In 1890 he took a place as surgeon on a trans-Atlantic steamer and crossed the ocean several times. In the fall of the same year he settled in Chicago, devoting his studies and work mostly to surgery, and surgical as well as general pathological anatomy, microscopy and bacteriology, in which lines he has published several articles in domestic and foreign medical journals. He is Professor of General Surgery to the Post Graduate Medical School, Chief Surgeon to the Columbia Charity Dispensary and Hospital, member of the Chicago Medical Society, Chicago Pathological Society, and Verein Deutscher Arzte in Prag.

BESHOAR, Michael, of Trinidad, Colorado, was born at Mifflintown, Pa., February 25, 1833, descended from a family which immigrated from the Palatinate, on the Rhine, before the revolutionary war, and settled in Cumberland county, Pa. He was educated in the common schools and at Tuscarora Academy, studied medicine under private preceptors at Lewiston, and attended lectures at Jefferson Medical College, and universities of Pennsylvania and Michigan; graduating in medicine from the University of Michigan in 1853. He attended a course of lectures in the St. Louis Medical College in 1863-4 and in Miami Medical College, Cincinnati, in 1873-4, and received the *ad eundam* degree from the latter. He pursued the practice of medicine at Pocahontas, Arkansas, from the spring of 1853 till the outbreak of the war in 1861. During this time he represented his county two terms in the State legislature, was surgeon of militia six years and took meteorological observations for the Smithsonian Institute seven years. At the commencement of the war he was made chief surgeon of the first regiment raised in his part of the State, and when the Arkansas troops were transferred to the Confederate service, he became a full surgeon of the provisional armies of the Confederate States, and served as such under Gen. Hardee, Solon Borlan, Lee Crandall, Jefferson Thompson, Albert Pike and T. C. Hindman. In the autumn of 1863 he left the Confederate service and practiced a few months in St. Louis, then two years at Fort Kearney, Nebraska, through the worst Indian troubles that have ever existed in the western country. In the fall of 1866 he

located at Pueblo, and in 1867 at Trinidad, where he still resides. Since coming to Colorado he was a member of the legislature, one term in territorial times and one term under the State government. He has been coroner, assessor, physician, clerk, judge, and superintendent of schools in his county. In 1876, he was the democratic nominee for lieutenant-governor and ran considerably ahead of his ticket. There is not a man in Colorado more widely and more favorably known than Dr. Beshoar. He is a permanent member of the American Medical Association, the American Public Health Association, the Colorado State Medical Society, and Las Animas County Medical Society. He founded the *Pueblo Chieftain* in 1868, and *Trinidad Advertiser* in 1882—the two leading daily newspapers of southern Colorado. Clear headed as a physician and surgeon he has the esteem and friendship of the better members of his profession; sagacious in politics he has the confidence of the

Michael Beshoar.

more honest elements of his party; and successful as a journalist, he has the enmity of those who bear the scars and scratches produced by his keenly pointed pen.

BETTMAN, Boerne, of Chicago, Ill., was born September 6, 1856, in Cincinnati, Ohio. His parents came to the Queen City in 1846, from a small village in Bavaria, not far from Wurzburg. His father is a retired general practitioner, a graduate from the University of Munich, in 1836. Dr. Boerne Bettman received his preliminary education in the public and high schools of his native city. He attended a three years' course of study, under the preceptorship of his father, in the Miami Medical College, and graduated in 1877, afterward serving the well-known oculist, Dr. E. Williams, as assistant. Later he worked under the guidance of Dr. Heitzman, of New York, in his laboratory; and then for a year and a half acted as assistant to Dr. Herman Knapp, and during a portion of the same

time also to Dr. Frank Bosworth, the well-known rhinologist and laryngologist. His course of study was then continued for three years in Europe, in the following manner: A half-year in Vienna was devoted principally to ophthalmological, otological, rhinological and laryngological work, his more celebrated teachers being Arlt, Stellwag, Yaeger, Mauthner, Fuchs, Pollitzer, Gruber and Storch. After an extended trip through the Tyrol, northern Italy, and southern Germany, he arrived in Heidelberg in the fall of 1879, and was soon after honored by being selected second assistant to Dr. Otto Becker, who at that time occupied the chair of ophthalmology in the renowned Carolina University. A few months later, on the departure of Dr. Kuhnt, now professor in Marburg, Dr. Bettman was elected to the position of first assistant. During this time he also worked in the pathological laboratory of Prof. Arnold, and did some original work on the pathological condition of the eyes in pernicious anæmia published in Knapp's *Archives of Ophthalmology*, 1881. Leisure time was devoted to the examinations of Becker's valuable collection of pathological eyes, to the study of embryology, physiological optics, to the attendance of Keno Fischer's lectures on philosophy, German, literature and other subjects. The remainder of the European stay was devoted to travels in Switzerland and northern Germany. Six weeks were devoted to Paris and to the clinics of De Weckers' Galozewski Pauss, Laudolt and Edward Meyer. In London he met the celebrated physicians of the world at the International Medical Congress of 1880. He arrived in New York, September 23, 1887, and two weeks later, having come to Chicago, opened an office there. He soon became connected with the Illinois Charitable Eye and Ear Infirmary as microscopist, later as assistant, and now is the third in seniority of the surgeons connected with that institute. He was the first lecturer of ophthalmology and otology in the College of Physicians and Surgeons of Chicago, and delivered lectures on the anatomy, histology, and functions of the eye and ear. He resigned his position in 1883. He called into life the Chicago Society of Ophthalmology and Otology, assisted at the organization of the Chicago Medico-Legal Society, serving two terms as second and first vice-presidents. Soon after his advent to Chicago, he joined the Chicago Medical Society; Microscopical Society; is also a member of the South Side Medical Club, and of the Practitioner's Club. In the fall of 1892 he was tendered the chair of Ophthalmology and Otology in the College of Physicians and Surgeons, in Chicago. He has held the same in the Chicago Post Graduate School since its inception. He served as Oculist and Aurist to the Cook County Hospital for two successive years, and at present is connected in the same capacity with the Michael Reese, German, and Chicago Charity Hospitals. Among his publications are the following: "The Operative Treatment of Episcleritis," *Weekly Medical Review*, March 17, 1883; "Ocular Troubles of Nasal Origin," *Journal American Medical Association*, January 17, 1887; "Traumatic Iridodyalyses," *North American Practitioner*, December, 1890; "Mastoid Periostitis," read before the Chicago Medical Society, November 4, 1889; "Dislocation of Lens into Anterior

Chamber," *Chicago Medical Record*, June, 1891; "Aural and Nasal Surgery," by Drs. Boerne and Jefferson Bettman, *Journal American Medical Association*, November 10, 1884; "Translation of Dr. Carl Koller's article on Cocaine," *Chicago Medical Journal and Examiner*, February, 1885; "Blindness following Hemorrhage." His most important work was on the introduction of a new operation for speedy ripening of cataracts. Three articles on this subject have appeared, one in the *Journal of the American Medical Association*, December 3, 1887; second in *New York Medical Record*, July, 1892; and the third in the *Annals of Ophthalmology and Otology*, February, 1893. He was one of the first to introduce peroxide of hydrogen into aural surgery. "Peroxide of Hydrogen as a Medicinal Agent," *Chicago Medical Journal and*

Long as his preceptor, and was graduated M. D., March, 1870, from Bellevue Hospital Medical College, and immediately engaged in the general practice in New Maysville. In October, 1871, he was married to Alice, daughter of Dr. William and Harriet Long, of his native county. In 1878 he sought a less laborious field of labor, by locating in Dallas, Texas, where he remained two years. In 1880 he located in Emporia, Lyon county, Kansas, where he has continued to reside, engaged in general practice. He is a member of Lyon County Medical Society and Kansas State Medical Society; he has been for the last six years, and is yet, United States Examining Surgeon for Pensions. He was elected mayor of the city of Emporia, Kansas, in April, 1891.

BIGELOW, Henry Jacob, of Boston, died at his summer home in Newton, Mass., October 30, 1890, aged seventy-two years. He was educated in the Boston Latin School and the Harvard Medical College (class of 1841), besides seeking further instruction in foreign cities. Later he was for a long time Surgeon to the Massachusetts General Hospital; and for twenty years filled the chairs of Surgery and Clinical Surgery at Harvard without an assistant. He was active in the earlier experiments with anæsthetics, and in November, 1846, made the original announcement in this country of their discovery. He has been an extensive writer and lecturer on surgical topics. One of his works on the mechanism of dislocation by the flexion method (1869) is still an authority. He contributed many valuable papers to the American Medical Association, such as the "Action of Water on Lead Pipes," articles on "Anæsthesia," embracing its statistics, "Cinchonia Cultivation," "Gutta Serena in Urethral Strictures," "Operation for Hernia," and a very suggestive treatise on "Nature and Disease." The above, however, lays no claim to being a complete list. Dr. Bigelow's labors and attainments secured for him membership in many American and European societies, among them the American Academy of Arts and Sciences, the Société Anatomique, the Société de Biologie and the Société de Chirurgie of France. He was the father of Dr. William S. Bigelow, of Boston.

BIGELOW, John Milton, of Albany, New York, was born in that city August 22, 1846. He is a descendant from the Bigelow family of Massachusetts of English origin. He is the oldest son, as was his father, grandfather, and great grandfather respectively, each of whom were physicians of great repute. He was graduated at the Albany Academy for Boys in 1863, and at Williams' College in 1866. He studied medicine at the College of Physicians and Surgeons, of New York City, from which he was graduated in 1869, and received the following year the honorary degree of M. D. from the Albany Medical College. He received the degree of Ph. D. from Rutgers College in 1892. He is a member of various medical societies, and has made important contributions to medical literature. He was appointed county physician for Albany in 1876, and was appointed Professor of Materia Medica and Therapeutics in the Albany Medical College, and is now professor of the same chair, to which diseases of the nose and throat have been added. Dr. Bigelow is attending Physician to Albany Hospital, Consulting Physician to St. Peter's Hospital, Albany, N. Y.

Boerne Bettman

Examiner, 1883. Dr. Bettman also served as assistant surgeon with the rank of captain, in the second regiment of the Illinois National Guard.

BIDDLE, George Allen, of Emporia, Kansas, was born in Putnam county, Indiana, October 15, 1845, near New Maysville, in that State. His early education consisted principally of practical lessons in agriculture, interspersed with the great variety of labor incident to a well-conducted farm, with about sixty days during the winter in the "district school." He enlisted as a private soldier in August, 1864, for a term of one year, and was assigned to company "E," First Indiana heavy artillery, and served out his term of enlistment. Immediately after his discharge from the army he entered the Danville (Indiana) Academy, where he continued two years, and then entered Asbury, now DePauw, University for one year. He then commenced the study of medicine at New Maysville, with Dr. R. W.

BILLINGS, John Shaw, of Washington, D. C., son of James Billings, of Saratoga county, New York, and Abby Shaw, of Rhode Island, was born April 12, 1838, in Switzerland county, Indiana. He was educated at Miami University, Oxford, Ohio, from which he graduated in 1857, taking the degree of A. M. three years later, and graduating from the Ohio Medical College, at Cincinnati, in 1860. He first settled in Cincinnati, but in 1861 entered the United States army, in which he still continues having resided since 1864 in the city of Washington. In November, 1861, he was appointed Acting Assistant Surgeon in the United States Army, and in April, 1862, assistant surgeon, having charge of hospitals at Washington, D. C., and West Philadelphia, until March, 1863, subsequently serving as operating surgeon in the field hospital of the second division, fifth corps, army of the Potomac, at Chancellorsville, Va., and in May, 1863, joining the seventh and tenth United States Infantry, taking charge afterwards of the field hospital of the second division of the fifth corps of the army of the Potomac, at Gettysburg, Pa. From October, 1863, to February, 1864, he was on hospital duty at David's and Bedloe's islands in the New York harbor, serving also as a member of the board of enrollment. In February, 1864, he attended the special expedition to the isle at Vache, W. I.; and in April, 1864, was acting medical inspector of the army of the Potomac. From August to December in 1864, he was on duty in the office of the medical director of the army of the Potomac, and since December, 1864, has been in the office of the surgeon-general, at Washington, D. C. He was successively brevetted captain, major, and lieutenant-colonel in the United States army for faithful and meritorious services during the war. In December, 1876, he was appointed surgeon, with the rank of major in the regular army. He is author of "Surgical Treatment of Epilepsy;" of reports in the "Medical and Surgical History of the Rebellion;" of "A Report of Investigations on Cryptogamic Growths," in connection with "Reports on the Diseases of Cattle in the United States;" of a "Report on Barracks and Hospitals;" of a "Catalogue of the Library of the Surgeon-General's Office, United States Army;" of "Notes on Hospital Construction;" "Reports and Papers of the American Public Health Association;" of a paper on "A Sanitary Survey of the United States, with Remarks on Medical Topography;" of "Bibliography of Cholera;" "The Cholera Epidemic of 1873 in the United States;" of "Literature and Institutions;" of "Medical Libraries in the United States;" of "A Report on the Hygiene of the United States Army;" and of "Reports and Papers on the Johns Hopkins Hospital;" and "Mortality and Vital Statistics of the United States, in the United States Census Reports." His great work, however, has been the "Index-Catalogue of the Library of the Surgeon-General's Office, United States Army," containing the bibliography of every medical subject as far as found in the library at present under Dr. Billings' care. This work consists of fourteen large quarto volumes. He is a lecturer on municipal hygiene in the Johns Hopkins University, and medical adviser of the Johns Hopkins Hospital. Dr. Billings is a member of numerous scientific organizations, including the Ameri-

can Medical Association and the National Academy of Sciences (1883), and he is also an honorary member of the Statistical Society of London, Royal Medical and Chirurgical Society of London and Medical Society of Sweden. In 1884 he received the degree of LL. D. from Harvard and the University of Edinburgh, and D. C. L. from the University of Oxford. In 1889 he addressed the British Medical Association on "Medicine in the United States."

BISHOP, Seth Scott, of Chicago, was born in Fond du Lac, Wisconsin, February 7, 1852. His parents, who left New York to become pioneers in the west, were of English and Scotch extraction. The subject of this sketch obtained his early education in the public schools of Fond du Lac, and graduated from a private academy, in 1870, with a high-school education, supplementing this with three years in the classical course at Beloit College.

Seth Scott Bishop

While attending the schools of his native town, and studying the piano and organ, impaired health necessitated an interruption of his studies, and he turned his attention to the art of printing. He worked at this trade in the office of the *Fond du Lac Commonwealth* until returning health permitted him to resume his studies. During this digression he printed the first successful daily paper on the first power press that ever appeared there. After returning to his academical studies he edited and published a paper called *The Pen*, in the interests of the school, setting the type and printing it out of school hours. About this time he began to read medicine in addition to his school course. Having prosecuted his studies as far as the home schools carried them, he went to New York and attended two courses, a preliminary and a regular one, in the medical department of the University of the City of New York, in 1871-72. He

studied medicine under the preceptorship of Dr. S. S. Bowers, for several years mayor of Fond du Lac, and graduated from the Northwestern University School of Medicine, in Chicago, in 1876. Dr. Bishop commenced the practice of his profession in Fond du Lac, but in a short time the "western fever" induced him to try the experiences of a country doctor. In midwinter he drove his horse and buggy from his old home to the vast prairies of Minnesota, where he practiced until the fall of 1879, when he sacrificed the delightful experiences of a country practice to locate in the city. Soon after settling in Chicago, he identified himself with the interests of various medical charities. In 1881 he was elected a member of the medical staff of the Southside Free Dispensary, where he served, first in the children's and afterward in the eye and ear department, for a number of years. Later he conducted clinics in the Westside Free Dispensary, and has held the appointment of consulting surgeon to the Illinois Masonic Orphans' Home from its foundation. He is an attending surgeon to the Illinois Charitable Eye and Ear Infirmary, where he has been in active service ever since 1882. Dr. Bishop is the discoverer of camphor-menthol, and is the inventor of numerous surgical instruments. He is the author of the following monographs, most of which he has read at the conventions of medical associations: "Hay Fever," the First Prize Essay of the United States Hay Fever Association; "Cocaine in Hay Fever," a lecture delivered in the Chicago Medical College; "The Pathology of Hay Fever," read at the ninth International Medical Congress; "A Statistical Report of Five Thousand Seven Hundred Cases of Diseases of the Ear," read at the same place; "The Treatment of Suppurative Inflammation of the Middle Ear;" "Operations on the Drum Head for Impaired Hearing," with report of cases; "Operations for Mastoid Disease;" "Compressed Air and Sprays in Diseases of the Nose, Throat and Ear;" "Atresia of the External Auditory Canal," read at the tenth International Congress, in Berlin; "The Rational Treatment of Common Aural Catarrh;" "Menthol in Diseases of the Respiratory Organs;" "Lessons from Fatal Mastoid Disease;" "Camphor-menthol in Catarrhal Diseases;" "The Treatment of Cold in the Head and Nervous Catarrh." Among the surgical instruments invented or devised by Dr. Bishop are the following: a pneumatic otoscope; an adjustable lamp bracket; an improved tonsilotome; a middle ear mirror; a caustic applicator; a middle ear curette; an ossicle vibrator; a compressed air meter; a light concentrator; a cold wire snare; a nasal speculum; a camphor-menthol inhaler; a pocket powder-blower; an office powder-blower; a nasal knife, and an automatic tuning fork. The following societies have elected the doctor to membership: The State medical societies of Wisconsin, Minnesota and Illinois; the Chicago Pathological Society; the United States Hay Fever Association; the Mississippi Valley Medical Association; the ninth and tenth International Medical Congresses; the American Medical Association; the Knights of Honor; the A. O. U. W.; Odd Fellows; Beta Theta Pi; Beloit College Chapter; and Masonic bodies. Dr. Bishop's family consists of his wife Jessie, daughter of the late Peter Button, the well-

known contractor and builder, and a Mason in high standing, and two children, Myrtle and Mabel. In 1890 the doctor and his wife took a trip to Europe, attending the meetings of the British Medical Association, in Birmingham, and the tenth International Medical Congress in Berlin.

BISHOP, William Thomas, of Harrisburg, Pa., was born at Hummelstown, that state, in 1840. He is of English descent and is a son of the late W. T. Bishop, a well known lawyer born in Baltimore, and grandson of Charles C. Bishop, a prominent merchant of the same city. The latter's father was the Reverend William Bishop of the Methodist church, whose ancestry were among the early settlers in the vicinity of Snow Hill, Maryland. The subject of this sketch received his academic education in the schools of Harrisburg, and in 1867 was married to Miss Emily Laning, of

W. T. Bishop

Wysox, Pa. He then studied medicine and attended lectures at the Rush Medical College, Chicago, from which he received his medical degree in 1879. Dr. Bishop, soon after this, established himself in the city of his present residence, where he has ever since been engaged in the general practice of his profession. On the organization of the Pennsylvania Railroad Volunteer Relief Department in 1886, Dr. Bishop was appointed medical Examiner, which position he still holds, and under his care this department has been most successfully managed since its establishment. He is ex-president of the Dauphin County Medical Society, and of the Harrisburg Pathological Society. He is a member of the Medical Societies of the State of Pennsylvania; the National Railway Surgeons Association; the American Public Health Association; the

American Electro Therapeutic Association; the American Medical Association, and a member of its judicial council. He is also identified with numerous other medical and scientific organizations and a regular attendant at their conventions and takes an active interest in their deliberations upon all questions, whether of scientific importance or those relating to their business phases. He is known as a ready, well posted, and convincing speaker. As a debater he is quick and sharp at repartee, as well as a forcible and logical reasoner. A well-trained mind with close application has rendered him an appreciative listener and an interesting conversationalist, as well as an able writer. In addition to his contributions to medical literature he has written many valued articles upon Masonic, temperance, and political questions.

BLACKBURN, Luke Pryor, of Frankfort, Kentucky, was born in Fayette county, Ky., June 16, 1816, and died September 14, 1887. He received his medical education and training at the Transylvania University, Lexington, Ky., whence he was graduated in 1834. He immediately began practice in that city in 1835. When cholera developed in the town of Versailles he went there and remained during the prevalence of the malady, giving gratuitous service to the sufferers. He afterwards made that town his home, and in 1843 was sent to the legislature as representative of Woodford county. In 1846 he removed to Natchez, Miss. Two years later, on the outbreak of yellow fever in New Orleans, as health officer of Natchez, he established the first effective quarantine against the former city that had ever been known in the Mississippi valley. At the same time he founded, at his own expense, a hospital for river men. He also served through the epidemic of 1854, and after its extinction obtained the passage of an act of congress establishing the quarantine station below New Orleans. During the rebellion he served on the staff of Confederate General Sterling Price as surgeon, and afterward visited the Bermuda islands, for the relief of sufferers there, at the request of the Governor-General of Canada. In 1867 he retired to his plantation in Arkansas, where he remained until 1873, when he returned to his native State. In 1875, when yellow fever was raging at Memphis and threatened the entire Mississippi valley, he hastened to the city and organized and directed a corps of physicians and nurses. Again in 1878, he gave his entire services and time for the relief of the victims of yellow fever at Hickman, Ky. In 1879, he was elected on the democratic ticket governor of Kentucky, and in that office distinguished himself by the large number of pardons issued to convicts for humane and sanitary reasons.

BLAINE, Harry Gordon, of Toledo, Ohio, was born in Wheeling, West Virginia, November 25, 1858. He is son of William I. and Nancy (Voshall) Blaine, the former a native of Carlisle, Pa., of English descent, the latter of Cadiz, Ohio, of Welsh lineage. The subject of this sketch, the third in a family of six children, by the misfortune of his parents was left to the cold mercy of the world at the age of three years. The ravages of the war of the rebellion had devastated the home of his childhood, his parents having at that time moved south. Cast upon the charities of

distant relatives he was brought to Ohio, and finally found shelter in the home of William F. Leonard, a farmer, living in Seneca county, Ohio, who reared him to manhood. His early education was received in the district schools of that county and the normal schools of Fostoria and Republic. Relying wholly upon himself, without resources, he started in life alone. When sixteen years old he commenced teaching school. He continued to teach winters and work summers until he was twenty years of age. When eighteen years old he resolved to make medicine the field of his future career, and soon after entered the office of Dr. James M. Parker, of Attica, Ohio, as a student, and in the fall of 1880 he matriculated at the Columbus Medical College, Columbus, Ohio, and attended his first course of lectures in that institution. He continued his study for another year, and graduated at Indianapolis, Ind., in the spring of 1882, and also

H. G. Blaine.

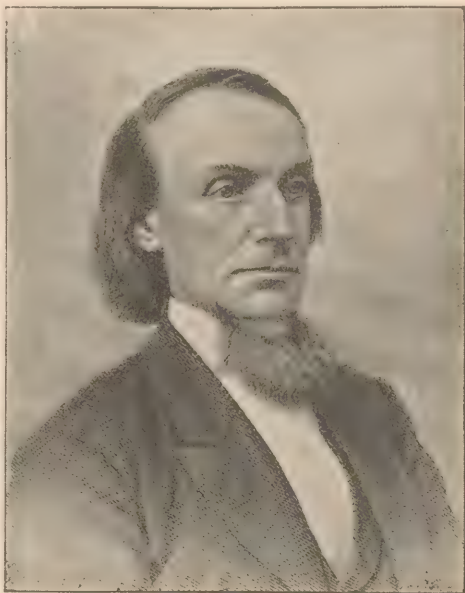

received a second diploma from the Toledo Medical College in 1886. A month after graduating he opened an office in the village of Reedtown, a small hamlet in Seneca county, Ohio, and remained there for about a year. In February, 1883, he formed a partnership with Dr. Alfred Force, at Attica, a town of about a thousand inhabitants, situated about six miles distant, and at once removed to that place, where he remained for nine years. The partnership with Dr. Force continued until July, 1884, when it was dissolved by mutual consent. With his love of work and indomitable spirit of medical enterprise, Dr. Blaine did not feel that his practice called forth all his powers, or satisfied his professional ambition. He therefore set to work to establish a medical journal, in which he would be able to ventilate his own ideas relating to medical science, and at the same time open an avenue through which he might become more familiar with the opinions of the profession at large, and Octo-

ber 1, 1884, he issued the first number of the *Medical Compend*, a practical monthly epitome of medicine and surgery, and the allied sciences. This he published at Attica until April, 1889, when his private office, the *Medical Compend* office and printing office, together with all their contents, were destroyed by fire. In June following, Dr. Jonathan Priest, of Toledo, Ohio, became associated with him in the publication of the *Medical Compend*, and the office of the journal was moved to that city. Dr. H. S. Havighorst succeeded Dr. Priest upon the death of the latter, in July, 1890, when the name of the journal was changed to the *Toledo Medical Compend*, and is still published by Drs. Blaine and Havighorst, under that title. In 1885 Dr. Blaine was appointed to the chair of Diseases of Women and Children in the Toledo Medical College, Toledo, Ohio, and was afterward chosen to fill the chair of Diseases of the Nervous System in the same institution, which position he held until May, 1892, when he resigned from the faculty. In May, 1891, the doctor moved from Attica, Ohio, to Toledo, where he soon gained a lucrative practice, and where he still remains, engaged in active work. Dr. Blaine was married in 1877, to Lucy E., daughter of James Shanks, of Chicago, Ohio, who has borne him four sons, the oldest being twins.

BLISS, D. W., of Washington City, D. C., was born in Auburn, N. Y., August 10, 1825; and died at his residence, February 21, 1889. He was named Doctor Willard, after the eminent physician. He pursued his medical studies at the Cleveland Medical College, Cleveland, Ohio, from which he received the degree of M. D. in 1846. He practiced the ensuing year in Iona, Mich., and then located at Grand Rapids, where a considerable reputation as a surgeon was obtained. At the outbreak of the war between the States he was commissioned surgeon of the third Michigan volunteers. In the latter part of 1861, he became a division surgeon and from the organization of the army of the Potomac till after the battle of Seven Pines he was attached to the staff of Gen. Philip Kearney. He was then ordered on hospital duty in Washington, where he superintended the construction of the Armory Square Hospital, and became its surgeon-in-chief. After the war he was connected with the board of health of Washington, and also became widely known as the champion of a South American cancer cure, but extensive trial of the remedy (*Conduran-go*) proved it to be of little value except as a palliative in malignant gastric disease. Dr. Bliss was one of the physicians and surgeons called to attend President Garfield after he was shot on July 2, 1881, and was unremitting in his professional attention until the President's death. When with his associates he was called upon for a bill for his services under an act of Congress making provision for the medical staff, and for the extra labor of the White House employes necessitated by the assassination, he presented one that Comptroller Lawrence felt obliged to reduce in order to apportion the \$57,000 appropriated for the medical staff among them. Dr. Bliss declined to accept his apportionment on the grounds that his private practice had been ruined and his health seriously impaired by the close attention to the President that the

exigencies of the case demanded. At the time of his death a special bill was pending in Congress to compensate him for his services in this notable case.

BOBBS, John Stough, of Indianapolis, Ind., was born at Greenvillage, Pa., December 28, 1809, and died at his place of residence May 1, 1870. One of his most intimate friends and biographers (the late Dr. G. W. Mears) of Indiana, writes that the boyhood of the subject of this sketch was spent, his parents being poor, in the acquisition of such knowledge as could be obtained at the then very common schools of a country village. "At the age of eighteen he wended his way on foot to Harrisburg, then as now the seat of government of Pennsylvania, in quest of employment. Being a lad of much more than ordinary intelligence, he attracted the attention of Dr. Mar-

J. S. Bobbs

tin Luther, then a practitioner of some eminence in that city. Upon a more thorough acquaintance, the doctor's interest increased, and feeling that the delicate and slender physique of his young friend unfitted him for the more rugged encounter with the world, proposed, upon the most liberal terms, his entrance to his office as a student of medicine. Unhappily this noble patron did not long survive to see with what fidelity to his own interest, and with what devotion to study his protegee had rewarded his generosity. Such indeed was the diligence with which he applied himself to books, that, notwithstanding the obstacles of a deficient preliminary education, he fitted himself, with the aid of a single course of lectures, for the successful practice of his profession in less than three years.

His first essay in this direction was made at Middletown, Pa., where he remained four years. Having early determined to make surgery a specialty, he found the locality he had chosen unsuited for the work, and soon decided upon selecting some point in the great west as the field of his future labors. In 1835, he moved to Indianapolis, Ind., with a view of making that city his permanent residence. True to his great purpose of securing for himself distinction in his chosen profession, he now gave himself up to the most laborious and unremitting study of books, both classical and professional. Soon sufficiently familiar with the languages, he bent his entire energies to investigations in his favorite department. As a means of furthering the objects of his very earnest pursuit after surgical knowledge, he concluded to avail himself of the advantages of a winter's dissection and clinical observation at Jefferson Medical College, Philadelphia, where the degree of doctor of medicine was conferred upon him in the spring of 1836. Rapidly attaining a reputation throughout the length and breadth of Indiana which might satisfy the most vaulting ambition, he was tendered by the trustees of Asbury University a chair in the medical department of that institution, then about being established at Indianapolis. The position was accepted. How well he acquitted himself in his new relations has been well stated by the late Hon. J. W. Gordon, one of his former students who long enjoyed his most intimate friendship. To quote his exact language he says: "I made the acquaintance of Professor Bobbs during the winter of 1850. He was then Professor of Surgery in the Indiana Central Medical College and dean of the faculty. I was a member of the class, and while making all due allowance for the partiality likely to arise in my mind from the relation between us, as professor and student, I believe I but express the judgment of a fair and just appreciation of his lectures and operations before his class, when I say, that in both respects he was fully up to the highest standards of the profession. His description of healthy and diseased action and the changes from the one to the other, have never been surpassed in point of clearness, accuracy, graphic force and eloquence. All that is possible for words to accomplish in bringing before the mind those great changes upon which health or disease, life or death depend, was effected by him in his lectures. The student who did not carry away in his memory such a portrait of each disease described by the professor as to be able to detect the original when presented for examination, must have lacked some mental endowment essential for success in his profession. Nor was he less remarkable for self-possession, steadiness, rapidity and accuracy in the use of the knife. No man ever saw his hand tremble or his cheek lose its color, in the presence of the most terrible complications attendant upon great and dangerous operations. But his self-control on such occasions was never the result either of ignorance or indifference to the consequences threatened and imminent in such cases; for he combined the clearest insight with the most thorough knowledge of the situation in which he was placed, and with a tender sensibility almost feminine in its character, felt every pang which disease or his

efforts to remove it inflicted upon his patient. Shallow observers, incapable of penetrating through the mask which his stern self command held up between them and his profound soul of love and pity, often pronounced him harsh and insensible to human suffering. Nor did he ever stop in the high career of duty to correct their unjust judgments, satisfied that it is better to 'feel another's woe,' and labor effectually to relieve it, than to receive the applause of the multitude for services never rendered, and pity never felt for the suffering children of men. He scorned to seem, but labored to be a true benefactor of mankind. Such was the impression of the man, which I carried away with me at the close of the term in the spring of 1851; and an intimate acquaintance of nearly twenty subsequent years never presented a single fact or ground to lead me to doubt its entire accuracy. He always held his profession sacred, high above all trickery and quackery, and labored with incessant diligence to place it in public estimation upon the same footing it held in his own regard. The most earnest and eloquent words that I have ever heard came from his heart and lips, when urging upon the minds of his classes the duty of fidelity to the cause of scientific medicine. In that duty he was ever faithful even to the moment of his death, and left his brethren, both in his words and deeds, a lesson they should never forget, to be true to the great field of truth and duty committed to their culture. To the poor and needy he was always wisely kind and beneficent. When called upon professionally to attend the sick of this class, he was known in innumerable instances to furnish, besides gratuitous service and necessary medicine, the means of life during their illness. The great beauty of his character in this respect was, that his charities were always rendered without display or ostentation. Many illustrations of this are worthy of record: One pathetic instance of this is related by a resident physician, who invited the professor, not long before his death, to a consultation in the country. Returning from the object of their visit, the doctor was hailed by a person from a cabin on the wayside, and requested to see a sick child. Discovering that the case was a bad one, he slipped to the door and asked the professor to see it. Having examined the patient, he returned to his carriage, leaving the doctor to make out his prescription. As the latter approached the carriage, he said to him: 'Doctor, this child is going to die, and the poor woman will not have wherewith to bury it.' Withdrawing his hand from his pocket, and presenting it with the palm downward, as if to conceal from the left what the right hand was doing, he dropped into the extended hand of the narrator a ten-dollar gold piece; 'Give that,' he said, 'to the widow; it will comfort her in the approaching extremity.' In this pharisaic age, it is indeed refreshing to find instances of unobtrusive charity which tell of the exercise of that noble virtue without public demonstration. He was a model friend. He saw the real character of all whom he admitted to his intimacy, and while to all the outside world he faithfully hid their faults, he candidly and fully presented them to him whose character they marred. This duty, the highest and most delicate and difficult of all, the duties of friendship and of life, owed by

man to man, he had the good sense, discrimination and tact, to perform always without insulting or wounding his friends. He was superior to all dissimulation, and spoke the truth with such frankness and earnestness that it was impossible to take offense at it. His friendships all stood upon a higher plane than any mere selfish interest. He accepted or rejected men as friends for their manhood, or want of it. The personal or social trappings and circumstances of men neither attracted nor repelled him. He felt and knew that

'The rank is but the guinea's stamp,
The man's the gowd for a' that.'

And elected his friends not for the image and superscription which family or position had impressed upon them, but for the original metal. So selected, he grappled them with hooks of steel, and never gave them up until they had shown, by some violation of principle that they were unworthy of his regard. He discriminated wisely the faults that proceeded from impulse and enthusiasm from those that grew out of calculation and self-interest. To the former he was as kind and forgiving as a mother to the faults of her child. The latter he never forgave. For a short time he engaged in politics; not, however, as a matter of choice, but from a sense of duty. He carried with him in the political arena the same thorough and exhaustive preparation, the same scrupulous regard for truth and fair dealing, the same severe devotion to reason, and the same lofty and fiery eloquence that lent such a charm to his professional addresses. It is almost needless to say, that in this episode of his life, he met the obligations of his position and performed them so as to win the confidence and approbation of his constituents. Dr. Bobbs was a man of the highest and coolest courage. Nothing could daunt him. During the first campaign of the civil war in West Virginia he accompanied the command of General Morris, and on one occasion, while the army was engaged in irregular skirmishing with the enemy in the woods that lay between the lines at Laurel Hill, he accompanied the skirmishers to the front. There being no regular line maintained on either side every man acted pretty much upon the suggestion of his own inclination. In this way one young soldier got far in advance of the rest and thus isolated was fatally shot by one of the enemy. His screams when struck created a momentary panic in those who were nearest him, and they all started on a precipitate retreat. Dr. Bobbs was near and promptly stopped the retreat; led the party to the spot whence the screams had come, and brought off the remains of the young man who was found quite dead. Throughout the entire affair he bore himself as a veteran and won the admiration of the entire party which he led to the rescue. He was a man of indefatigable industry. Up to the period of his death he was a devoted student, laboring at his books as few men work. With a slender constitution at best, and a system worn down by disease contracted in the army, he labored incessantly. His days were given to the duties of an ardent surgical practice, his nights spent almost wholly in his library, the arsenal's morning gun very frequently summoned him to the few hours of repose allowed himself. Nothing daunted by his enfeebled health, he did not hesitate to enter with his usual spirit

into the project of a new medical school in his city, giving to the enterprise the prestige of his high reputation, and to the faculty the aid of his distinguished ability as a teacher. The very able and conclusive manner in his inaugural address before the Indiana State Medical Society (three years previous) in which he combatted the arguments directed against the establishment in his state of a journal and a school in the interest of medical progress, and the very liberal bequest to the college his efforts had contributed so largely to found are among the numerous proofs he has left behind of his loyalty to legitimate medicine and earnest zeal in the cause of a science he so much loved, and to the advancement of which he had devoted his short, but active and useful life. Dr. Bobbs was appointed by Gov. Morton during the rebellion as an agent for his State and in this capacity he visited the soldiers of Indiana in fields and hospitals and had supervision of their medical and surgical treatment, and did valuable service in looking after their general welfare. As has been mentioned he was the professor of surgery in the first medical college organized in Indiana. He was a forcible writer on all questions that engaged his attention and wrote much on professional and public subjects both in newspapers and medical journals. In all public movements affecting the interest of his city, whether concerning him professionally or not, he was always active and effective. He was an adroit and thorough politician, as well as a skillful and accomplished physician. He was the first surgeon to perform the operation of cholecystotomy. The account given by Dr. Kemper derived from the "Transactions of the Indiana State Medical Society for 1868," should be noted in this connection as affording not only the initial step, but the earliest result on record of the fulfilment of a radical measure for the relief of occlusion of the gall-bladder, and serves as an illustration of the practical insight gained by this successful operative procedure of Dr. Bobbs. "His patient was a lady thirty years of age. The growth of the gall bladder had been gradual for about four years. The true nature of the enlargement was in doubt prior to the operation, but the patient insisted upon operative measures. Accordingly on June 15, 1867, assisted by a number of medical gentlemen, Dr. Bobbs performed the operation as follows: An exploratory incision was made through the abdominal wall, extending from the umbilicus to the pubis. This revealed extensive adhesions of the omentum to the adjacent tissues. The incision was then extended two and a half centimeters above the umbilicus and latterly over the most prominent point of the tumor. Tearing through the adhesions with his fingers he reached a sack about thirteen centimeters long and five centimeters in diameter evidently containing a pellucid fluid. As no pedicle could be discovered, the lower point of the sac was incised 'when a perfectly limpid fluid escaped, propelling with considerable force several solid bodies about the size of ordinary rifle bullets.' The gall bladder was thus emptied, the incision in its walls stitched, and the ends cut closely and returned into the abdominal cavity. The external wound was properly closed. Her recovery was rapid without an untoward symptom. In four weeks she was able to ride out." Mrs.

Barnesworth, the lady upon whom the operation was performed, more than a quarter of a century ago, is at this date (1893) still living, and resides near the village of Oaklandon, about twenty miles east of Indianapolis, and her physician, Dr. Kimberlin, states that she often refers to the ordeal, and its happy termination, as the great event of her life. Referring to this case, Dr. Kemper, in Woods' "Reference Hand-book of the Medical Sciences" (Vol. II, p. 118), says: "When the operation of cholecystotomy shall have been placed on a firm and scientific basis, and recognized and acknowledged by our profession—as assuredly it will—and its literature fully considered, the luster of no name on its roll shall exceed that of Dr. Bobbs." In his recent address before the New York State Medical Society, Dr. D. F. Dennis, speaking of the operation under consideration, gives full credit to the subject of this sketch for having first performed it, and several times of late in historical addresses the same credit has been given, and the fact is now well established and understood. Referring to this case, Dr. Gaston writes: "Though not a premeditated cholecystotomy, it serves to guide us in similar proceedings, authorizing in suitable cases the suturing of the opening in the gall-bladder separately from the abdominal wall, and dropping it back into the abdominal cavity. With the practical outlook, as it is at present, we can glance back to the allusions of Sharp, Goode, Black, Morgagni, André, Petit and Morand, as paving the way to the more precise suggestions of Thudicum, Daly, and Maunder which preceded the performance of the first cholecystotomy in due form, by Bobbs." Dr. Bobbs was married in 1840, to Miss Catherine Cameron, a sister of the Hon. Simon Cameron of Pennsylvania. He has left the record of a life fragrant with kindly deeds and memorable for its usefulness. He bequeathed \$2,000 to establish the "Bobbs Dispensary," for the benefit of the suffering poor of Indianapolis, managed by the faculty of the Medical College of Indiana. He also founded the "Bobbs Library," which is under the same direction, and contains the most valuable collection of medical works in the State.

BOND, Young H., of St. Louis, Mo., was born in Calvert county, Maryland, July 18, 1846, and is a son of the Hon. James A. Bond, of his native State. Dr. Bond was educated at Princeton College, N. J., and was graduated in medicine at the University of Maryland in 1867. The subject of this sketch is one of the few men in the profession who, immediately after being graduated, leaped as it were into a gilt-edged practice and succeeded from the start. Dr. Bond located in St. Louis just after the war and was fortunate in selecting his time and place of locating, for uninterrupted success has attended his work from the day he entered that city. Now in the prime of life, having achieved a fortune by hard work and good investments, a rich man having made every dollar that he has, doing one of the largest practices in the city of St. Louis, he is justified in feeling a reasonable pride in that which he has done, and indeed secure and reliant as regards the future. He is at the head of the Marion-Sims College of Medicine, being dean, and in addition to medical attainments of a high order, he possesses the business qualities which are so essential to the

success of such ventures. The getting together of a successful working body of men as a faculty and the organization of the same, the securing of ground on which to build a palatial structure, the getting together of the proper equipment for a well conducted medical college, is no small work. The Marion-Sims College of Medicine is fortunate in having for its head a man possessed of such a head for organization, with such superb executive ability and with the energy and youthfulness to carry on the work for many years to come. His associates in his work are almost entirely young men, with few exceptions they are all hovering in the neighborhood of forty years, and are uniformly well established in practice, experienced teachers and equipped in a manner to do good work. This college was established in 1890, and its list of male students the first year numbered one hundred

Young H. Bond

and fifty and the succeeding year, two hundred and sixty. The institution now has a larger class of students than any other medical college in Missouri. Dr. Bond has been president of the St. Louis Medical Society, and many years ago at a time when the health board of St. Louis had authority, he was a member of that body and a very efficient one. He has been Vice-President of the Mississippi Valley Medical Association and there are evidently many honors yet in store for him in consequence of his well earned professional popularity, both in his city and adopted State.

BONTECOU, Reed Brockway, of Troy, N. Y., was born in that city April 22, 1824. He is of Huguenot descent on his father's side, and on his mother's Scotch. He was educated at the high school academy, and Rensselaer Polytechnic Institute, of Troy, and Poultney Academy, Vermont. He studied medicine with Dr. A. G. Skilton, Dr. Thomas C. Brinsmade

and Dr. John Wright of Troy. He attended the medical department of the University of New York, in 1844 and 1845, and graduated at the Castleton Medical College, Vermont, May, 1847, when he at once entered into practice with his preceptor, Dr. Thomas C. Brinsmade, and has always resided in his native city. In 1846 he made a voyage up the Amazon river, passing the whole of that year exploring the regions round about in the interests of natural science. His notable cases embrace the "Ligature of the Right Sub-clavian Artery for Traumatic Aneurism;" "Operation for the Radical Cure of Umbilical Hernia;" "Ligature of Right Iliac Artery for Aneurism;" "Ovariectomy, including both Ovaries;" "Lithotomy;" numerous cases of "Tracheotomy," "Strangulated Hernia," and several cases of "Pelvic Abscess, from Perforation of the Appendix Vermiformis," cured by operation; two cases of "Inverted Uteri, Reduced by an Improved Method;" and has contributed to various journals reports of interesting cases. He is a member of the Rensselaer County Medical Society, permanent member of the New York State Medical Society, the American Medical Association and American Surgical Association. For several years he held the office of coroner and examining surgeon for pensions. He was surgeon of the 2d New York Volunteers, from the organization of the regiment, April, 1861, until he was commissioned surgeon of volunteers, September, 1861, taking part in the battle of Big Bethel, Va., June 10, 1861, and present at the fight between the Monitor and Merrimac. He was in charge of the Hygiene United States Army General Hospital at Fortress Monroe, Va., from September, 1861, until its destruction, September, 1862, when he was ordered to the army of the Potomac, and put on duty by the surgeon-general in his office, for a short time, after which he was ordered to the department of the south, and placed in charge of one of the hospitals at Beaufort, S. C., and subsequently appointed chief medical officer of all the hospitals there. He went with Medical Director H. C. Crane, United States army, to the iron-clad attack on Fort Sumter, and shortly afterwards was put in charge of the hospital steamer Cosmopolitan, lying off Charleston, during the siege of that place, and collected the sick and wounded from all points below on the Atlantic coast, and transferred them to Hilton Head, Beaufort and New York city. In the early part of October, 1863, he was ordered to Washington, D. C., to take charge of the Harewood United States Army General Hospital, where he continued on duty until its discontinuance, in May, 1866, and thereafter being employed until mustered out, in June, 1866, on various boards of investigation, by order of the surgeon-general. During this period of military service, exceeding five years, he repeatedly performed all the important operations in military surgery, and originated and practiced the application of photography in military surgical histories. He was one of the largest contributors to the "Surgical History of the War," and to the Army Medical Museum. The Transactions of the American Medical Association, for 1876, giving a résumé of the operations on the larger joints, frequently refer to him as an operator. He was brevetted lieutenant-colonel and colonel of volunteers, March 13, 1865, for faithful and meritorious

services during the war. He was married, July 18, 1849, to Susan Northup. Of six children, one was born in the hospital at Fortress Monroe, Va., November, 1861, and one at Harewood Hospital, Washington, D. C., 1864. Dr. Bontecou, although advanced in years, is still (1893) in active practice, and is now surgeon to Marshall Infirmary of his native city.

BORCK, Mathias Adolph Edward, of St. Louis, Mo., was born at Hamburg, Germany, April 18, 1834. His father was a noted German surgeon and his mother an educated Danish lady, and to the latter he is indebted for his primary education. Energy and ability always merit, and usually win, distinction. These traits of character appear united in the subject of this sketch to an eminent degree. At the age of eleven he gained, by successful competition, a free scholarship

Edw. Borck.

in the Hamburg Gymnasium, and also in the Anatomical and Surgical School of Hamburg. The war for the independence of Schleswig-Holstein from Denmark drew the young republican from his studies. He served as a volunteer dresser in the Military Hospital. After the war closed he returned, and in 1851 graduated with high honors. An American in sympathy, he immediately came to this country and made Baltimore his home. By teaching caligraphy he maintained himself while he mastered the English language. At the same time he pursued his medical studies under the precept of such eminent men as the late Prof. Nathan R. Smith, the late Prof. Samuel Chew, Dr. Edward Dwinnell and others, and during this time he also practiced minor surgery and dentistry. In 1862 he was graduated from the Maryland University School of Medicine in Baltimore. In the

beginning of our civil war he served as an Acting Assistant Surgeon United States Army at the West Building Hospital, Baltimore, Md. In 1863 he was commissioned assistant surgeon of the tenth Maryland infantry, army of the Potomac, and February 3, 1864, he was promoted to a surgeon of the third Maryland cavalry, eighteenth army corps department of the Gulf. On detached duty he went with Major General Banks on the Red river expedition; after the surrender of Fort Gaines, Daulphine Island, he was there the post surgeon under Major General Gordon Granger. Taken with typho-malarial fever and not expecting to recover, he resigned December 10, 1864, at New Orleans, La., returned home to Baltimore. After having gained health again he moved to Hancock, Washington county, Md., a small town on the Potomac, where he enjoyed a very large and laborious practice until 1868; when his health gave away again, he returned for a short time to Baltimore, and then went to Paducah, Ky., in 1869. Restored to health he moved to St. Louis, Missouri, and settled down again for active life. He slowly but surely acquired a good practice. His success is attributed to his skill as a surgeon. He attended the late Prof. John T. Hodgen's lectures in the St. Louis Medical College, from which school he received an additional degree in 1874. Dr. Borck was a member and the secretary of the faculty of the college for medical practitioners of St. Louis, holding the chair of Professor of Surgical Diseases of Children from 1882 to 1884. He is a fluent speaker, in debate forcible and as sharp as his scalpel; but he never speaks unless he has something to say; as a teacher he is admired for his thorough demonstration, and for many years gave private lectures and instruction in surgery to graduates. His manner of writing is *multus in parvum*. He is a good performer upon the piano and a vocalist, and an artist with the brush. Many of his double life size anatomical oil drawings can be seen at the Marion-Sims Medical College of St. Louis. He speaks, reads and writes: English, German, French, Dutch, and Danish. He is a member of the surgical and medical faculty of Maryland, and the Baltimore Medical Association; St. Louis Medical Society (vice-president); Tri-State Medical Association, now the Mississippi Valley Association, (vice-president), and is a permanent member of the American Medical Association. He was a delegate to the Eighth International Medical Congress at Copenhagen, Denmark, in 1884. He remained abroad for study and observation, visited the hospitals in London and Paris, spent several months at the Hamburger Krankenhaus with the celebrated surgeon, Max Schede. On his return to St. Louis in 1885, he established his Private Surgical Home. His practice is confined to surgery exclusively, and he devotes his whole attention to his institution. His little monograph, "Home Again," contains a report of the congress and general observations, which is very instructive and was most favorably received by the profession and the press. He was also a member of the Tenth International Medical Congress, Berlin, 1890. He was the first surgeon who advocated and practiced the subcutaneous division of the capsule during the second stage of hip disease, "stage of serous or synovial effusion," with success. He is the

author of many valuable contributions to medicine, among which his "Monograph on Fracture of the Femur," "Ovarian Tumors and Method of Operating," "Observations on Surgical Diseases of Children," "Reflections upon the History and Progress of the Surgical Treatment of Wounds and Inflammations," are predominant. Some of his papers have been translated and published in foreign journals. In 1885 he reported his first fifty cases of ovariectomy with but five deaths. His surgical operations are appreciated by his professional brethren as well performed and are in a high degree successful. His success as an ovariectomist has received favorable comment. He is known abroad. The *Obstetric Gazette*, July, 1879 says: "Dr. Edward Borck's ovarian cyst elevator was presented by Mr. Spencer Wells to the museum of the Royal College of Surgeons." This instrument is now most universally in use by operators, which is certainly a compliment to him as well as American surgery. He is widely known as an untiring worker and close student who gives the utmost attention to the smallest details, factors which have doubtless largely contributed to his professional success. Dr. Borck was married in 1854, has no children, and contemplates endowing a Children's Hospital with his earthly goods.

BOWDITCH, Henry Ingersoll, of Boston, Mass., was born at Salem, Mass., August 9, 1808, and died in the former city, January 14, 1892. "His father was Nathaniel Bowditch, the eminent mathematician and translator of the "Mechanique Celeste," and his mother, Mary Ingersoll; parents who have transmitted in a remarkable degree to their descendants the honesty and strength of character peculiar to them. The father, as is well known, educated himself in hours which by others were taken for rest or recreation; and this hard experience led to restrictions in the education of the children, which, though some of them were afterwards regretted by the latter, many have been, on the whole, beneficent. Thus, for example, they were never allowed to devote any time to music, the study of which, considering the hard struggle in life before them, the father considered a waste of time, and likely to lead to greater waste in the enjoyment of it. The subject of this sketch attended a private grammar school in Salem, Mass., and in a programme of an exhibition at this school, in 1822, he appears for a Latin dialogue with J. B. Bigelow, which argues that he was at this early age a considerable student, but is said to have been fond of outdoor exercise, full of life and innocent fun. The family moved to Boston in 1823, where his father had been invited to the presidency of the Massachusetts Hospital Life Insurance Company, which afterwards, under his management, attained wonderful growth and prosperity. In Boston, young Bowditch attended the Public Latin School, entered Harvard College as a Sophomore and graduated in the class of 1828." One of his biographers, Dr. Frederick I. Knight, who enjoyed his intimate acquaintance, referring to his industrious habits, says: "He was always occupied. I have wondered whether the non-use of tobacco might not have had something to do with this, knowing how often it serves its devotee as both companion and occupation. He apparently had one of those brains rested by change of work. He never sat still musing,

or walked up and down thinking out the solution of any subject, but he thought with pen in hand." After taking his academic degree, Dr. Bowditch entered the Harvard Medical School. What determined his choice of a profession is unknown, except that his mother was desirous that her sons should take different professions, and he felt himself more inclined to medicine than to theology or law. There are now few living associates who can tell us of his immediate enthusiastic devotion to his chosen profession, but of this fact there can be no question. In September, 1830, he entered the Massachusetts General Hospital as medical house-pupil, and served one year. He received his medical degree in 1832, and went to Paris, as was the custom in those days, to complete his medical education. It was natural that a man of his mind and home training in regard to exact truth should have been soon attracted to Louis and his teachings, and eventually to have been thoroughly devoted to them. The numerical method as it was called, the recording and analyzing of symptoms in a large number of cases without any preconceived theory of the disease, simply the recording of facts and drawing logical deductions from them, was then being expounded by Louis, whom Dr. Bowditch delighted to call master. So thoroughly did Dr. Bowditch always practice this method, so thoroughly did he identify himself with it, and so consistent was it with his own character, that one can hardly help feeling that even if he had not the advantage of Louis's teaching, he would have adopted such a method himself. His friendship with Louis was kept up until the death of the latter. If asked what he had learned abroad that was especially valuable, he, while admitting the many things in clinical and pathological work which was new to him, would undoubtedly have said, "What I value most is the proper method of observation and recording of cases." It was in Paris that Dr. Bowditch first met Miss Olivia Yardley, who was destined, a few years later to become his bride, and who it is said had all the qualifications for his complement, whether it was in managing the exchequer, in making drawings of his microscopical preparations, or in the exercise of accomplishments who go to make up the amenities of life. After a residence of two years in Paris he returned to Boston (in 1834), and established himself in practice. With enthusiasm he devoted himself to the propagation of the teaching of Louis, and founded in 1835 a society for medical observation, on the plan of the one in Paris, for practice in the correct observing and recording of cases. Its membership was small, chiefly medical students, and was discontinued in 1838. Soon after this Dr. Bowditch was associated with Drs. Marshall S. Perry, Charles H. Steadman and Henry G. Wiley, in a private medical school. They had about fifteen students. There were recitations and clinical instruction. The recitations were held at an infirmary for chest diseases, with which most, if not all, the teachers were connected. Dr. Bowditch, in addition to his duties as admitting physician to the Massachusetts General Hospital, made the autopsies. These the students of his private school were permitted to witness. He retained the position last referred to from 1838 to 1845.

From the date of his first settling in Boston Dr. Bowditch interested himself in all that concerned the welfare of his fellow-men. He aided in establishing the Warren Street Chapel for the education and elevation of the young. He was superintendent of its Sunday-school, and endeared himself to every one in it. The children went to his office every Saturday afternoon for books, and the young men used to meet him on the Common at five o'clock in the morning to play cricket, they being clerks in stores and not able to go at any other time. One of them, however, says in a recent letter that he used to steal time from his dinner hour to call for a talk with Dr. Bowditch who at that time was not oppressed with patients, and always glad to see him and well remembers that Dr. Bowditch was quite elated that his first year's income equaled that of Dr. John Wares' first year, namely seventy-five dollars. Dr. Bowditch had just settled in Boston when the mobbing of Garrison occurred, and henceforth till the proclamation of emancipation he was an active, zealous, uncompromising anti-slavery man. He was the intimate friend of Sumner, Andrew, Bird, May, and other leaders of this at that time unpopular cause. He was a philanthropist in the fullest Bostonian sense of the term. Having joined forces with Wendell Phillips and Garrison in the work of breaking down slavery he was singled out to be named "the anti-slavery fighter," a title which he afterwards said that he held to be the proudest one he could ever hold during his life. He was the first in Boston, says Frederick Douglass, "to treat me as a man." In 1846 the visiting medicine staff of the Massachusetts General Hospital, consisting of three physicians, namely: Dr. Jacob Bigelow, Enoch Hale, and J. B. S. Jackson, was augmented by the addition of three more, namely, Dr. John D. Fisher, Oliver Wendell Holmes, and Dr. Bowditch. He served in this capacity eighteen years. Any one who ever made a visit with him knows how thoroughly he did his duty to both the hospital and the patient. In 1846 he also aided in reviving the Society for Medical Observation. In 1852 and afterwards he gave courses of instruction in auscultation and percussion in the Boylston Medical School. This was a private school which, however, gave a complete course of medical education, had its own dissecting room and infirmary, but did not confer degrees. It is said that this school was established for the purpose of getting more thorough hard work out of medical students than was the fashion of the time, and to encourage the graded system of study. It possessed an able faculty but was discontinued in 1855. Dr. Bowditch was appointed to the Jackson Professorship of Clinical Medicine in the Harvard Medical School in 1859, succeeding Dr. George C. Shattuck who was transferred to the Hersey Professorship of the Theory and Practice of Medicine, vacant by the resignation of Dr. John Ware. He continued in this position eight years. As a teacher he is said to have had as little capability for oratorical display as his master Louis, but his careful examination of patients and analysis of symptoms, rendered his exercises very attractive and highly valued by students. His utterly unselfish zeal in his search after truth and the welfare of his patients is said to have exer-

cised a beneficent influence upon those who came near him, and to-day hundreds are working on a higher level in consequence of their having known him. In 1852 he wounded his hand in an obstetric operation. Septicemia and a long illness followed. This caused him to give up midwifery, and as the years went on, although he did not call himself a specialist, and although he continued to see all kinds of medical cases, especially in consultation, his practice became more and more limited to thoracic diseases on which he now became an authority. During the civil war he did everything in his power for the cause of the government and good of the soldier. Especially did he labor hard for the adoption of a proper ambulance system in our army, which was finally accomplished, largely through his efforts. He gave his first born to the army, and bore his death in battle with heroic resignation. Dr. Bowditch, during the last years of his life, devoted himself to his large office and private practice and to State medicine. He was largely instrumental in the establishment of the State Board of Health in Massachusetts (the first one in the country), and was its chairman for ten years. In 1876 he delivered an important address before the International Medical Congress, held at Philadelphia, in which he sketched the progress of public hygiene and its resultant, State preventive medicine, from the standpoint of an observer looking over the centennial period then closing. In that address he claimed that more practical work had been done among the people, during the ten years then ending, with the intention to prevent and crush out disease, and more publications illustrative of public hygiene had been given forth the world over, than since the Christian era began. He also dwelt with commendatory emphasis upon the part taken by the American Medical Association in helping forward the cause of sanitary science and in endeavoring to obtain a national health organization from the Federal Government. During this time, however, many reforms were carried through against determined opposition. He was for a short time a member of the National Board of Health, established after the yellow fever epidemic of 1878. For many years he was a regular attendant at the meetings of the American Medical Association, and one of the most respected and beloved of its members. He was president of the society in 1877, the meeting being held in Chicago. Dr. Bowditch revisited Europe three times—namely, in 1859, 1867 and 1870. These trips gave him an opportunity of renewing old acquaintances and making new ones among the profession abroad, and is said to have enjoyed such vacations more than by most professional men, for he was a man of much general culture, who read and reread his classics, and was exceedingly fond and appreciative of art and the best music. He appears to have greatly enjoyed the meetings of the "Thursday Evening Club," in Boston, of which Holmes, Longfellow and other wits and poets were members. Dr. Bowditch's life was a very full one, distinguished, whether we consider him as a physician, teacher, citizen, or simply as a man, by courage, simplicity, zeal, industry and an intense interest in progress. There never was a man who more completely disregarded consequences when he felt that duty dictated

action; whether this was a criticism of current medical practice, or of the selfish motives of obstructors of sanitary legislation, the defense of a runaway slave, or the branding of a deserter from the army. His simplicity was such that on acquaintance his bitterest enemies became his best friends. How true was this with regard to our Southern brethren! When the war was over it was ended as far as he was concerned; and he was one of the first to welcome the grandsons of John C. Calhoun to his own hospitable fireside. Members of our profession in the South, who had regarded him as an arch-enemy, soon became his dearest friends. His remarkable industry is testified by his numerous contributions to medical and general literature. Dr. Bowditch did not rush into print prematurely, but waited till experience gave him the right to speak with authority. He published *The Young Stethoscopist* in 1848, when forty years of age, and his first communication on "Paracentesis Thoracis" in 1851. Probably his communications on the subject, appearing at intervals during the remainder of his active professional life, are more widely known, and have done more to extend his reputation, than anything else he has written. While he never thought of claiming the discovery of the method of removing fluid from the chest by aspiration, he appreciated at once the value of the procedure and made such practical use of it as finally, after constant iteration and reiteration in societies and medical journals, to compel the profession, not only in this country, but also of the whole civilized world to the same appreciation of it. In 1862 he published his exhaustive investigations on soil-moisture as a cause of consumption in Massachusetts, which with the subsequent work of "Buchanan in England," in the same field, have proved beyond question that this condition may be an important factor in the production of the disease. He also translated Louis' "Researches on Phthisis," his "Memoirs on Clinical Instruction," and "Observations on Gastro-Enteritis." His spirit of reform led him in the later years of his life to warmly espouse the cause of the admission of women to the Massachusetts Medical Society which was accomplished in 1884, and to advocate a more liberal attitude towards educated medical men who may profess doctrines to which we can not subscribe. In regard to his views on this subject the reader is referred to a paper read by him before the Rhode Island Medical Society in 1887. In this essay he called attention to the past, present, and future treatment of homeopathy, eclecticism, and kindred delusions which may hereafter arise in the medical profession, as viewed from the stand-point of the history of medicine and of personal experience. Dr. Bowditch, besides holding the principal positions which have already been mentioned, was consulting physician to the City, Carney, and New England Hospitals, a member of the principal medical societies of Boston, Fellow of the American Academy of Arts and Sciences, of the Paris Obstetrical Society, of the Paris Society of Public Hygiene, and honorary member of the Royal Italian Society of Hygiene, of the New York Academy of Medicine, of the Philadelphia College of Physicians, and of the New York, Rhode Island and Connecticut State Medical Societies. Before the time of his death Dr. Bowditch was

spoken of as the oldest physician in Boston, and he was certainly in the front rank of the veterans, having passed more than half a century in the profession. The fineness of his feeling toward his life-work and toward his fellow-workers may be judged from some words of his own—written in 1862—changed in a few points so that they may be read as applicable to himself. He has filled with honor the sacred office of family physician. He needs no higher or sweeter eulogium; for that office worthily filled carries within itself as rare a combination of virtues possessed and of duties done as usually falls to the lot of man.

BOWEN, Asa B., of Maquoketa, Iowa, was born at Eastford, Conn., April 12, 1842. His ancestors came from Wales and settled in Massachusetts, in 1640. He attended the district schools in his native town, and an academic course at Mexico, Oswego county, N. Y., where he also studied his chosen profession

Asa B. Bowen

with Doctors B. E. Bowen and G. A. Dayton; he also acquired some experience as a teacher in the town. He graduated at the Albany Medical College, in 1868, after which he devoted some time to hospital and clinical practice in New York city. He located in Maquoketa, Iowa, in 1869, where he has since resided. He served one year in the United States navy during the war, on the United States man-of-war Neptune, which cruised a portion of the time in the West Indies, acting as hospital steward. He is engaged in general practice, and among his important surgical operations is a successful ovariectomy. The doctor has held the position of United States pension surgeon under the administration of Presidents Grant, Garfield, Arthur and Harrison, and is also local surgeon to the C. & N. W. R. R., and is a member of the National Association of Railroad Surgeons. He has contributed to medical literature an article before the Iowa State Medical Society on "Ty-

phoid Fever," and one entitled "The Management of Compound Fractures." He is an active member of the American Medical Association, before which, at its Newport meeting, he read a paper entitled "Laparotomy for Uterine Fibroids, with an Unique Case."

BOYD, James P., of Albany, N. Y., was born in that city February 23, 1847. He is a son of an eminent physician of the same name and was educated at the Albany Academy and Princeton College, New Jersey, at which institution he was graduated in 1867. He studied medicine at the College of Physicians and Surgeons of New York, from which he received the degree of M. D. in 1871. After visiting Europe and attending the schools and hospitals of Vienna, Berlin, and Heidelberg for two years, he settled as a practitioner in his native city where he has been established for the last twenty years. In 1876 he was chosen Professor of Obstetrics and Diseases of Women and Children in the Albany Medical College. He is attending physician to the Albany Hospital, consulting physician to St. Peter's Hospital; member of the American Medical Association, American Association of Obstetricians and Gynecologists, Medical Society of the State of New York, and the Albany County Medical Society.

BOYER, Samuel S., of Throckmorton, Texas, was born in Mifflintown, Pa., June 9, 1840. He was graduated M. D. at Jefferson Medical College, Philadelphia, Pa., in 1864, soon after which he was appointed Acting Assistant Surgeon U. S. Army, and has since served almost continuously in that capacity in various hospitals and posts in Virginia, North Carolina, South Carolina, Sitka, in Alaska, Nebraska, Idaho and Texas. Dr. Boyer having retired from army service is now established in the latter State, at Throckmorton, where he is engaged in a successful general practice of medicine and surgery.

BRADBURY, Osgood N., of Norway, Maine, was born in that city October 28, 1828. He was graduated M. D. at the Maine Medical School, Brunswick, June 1, 1864. He was immediately appointed Acting Assistant Surgeon U. S. Army, and served in that capacity until December 31, 1865, at Cony U. S. General Hospital, Augusta, Maine, and was in charge of the Post Hospital in that city from January 1 until June 16, 1866. He has served more than fifteen years as Examining Surgeon for the U. S. Pension Bureau. He is also Medical Examiner and Adviser for numerous life insurance companies. Dr. Bradbury is one of the most accomplished physicians of his vicinity and has been engaged for many years in an active and successful practice of general medicine in his native city.

BRAINERD, Ira Newton, of Alma, Michigan, was born in Grand Blanc, Michigan, February 3, 1852. His ancestors were, for many generations, New Englanders; but in 1833, his grandfather, Alfred Brainerd, moved to Michigan, locating in the township of Grand Blanc, where the Brainerd families have, for the most part, since resided. The subject of this sketch graduated from Fenton Seminary, in 1875, and from Michigan State Normal School in 1876. In 1879 he entered the Department of Medicine and Surgery in the University of Michigan as a Junior, and that year took a special course in Microscopy and Histology, and one in Electro-therapeutics.

Neither course was required at that time. He took his degree in medicine from Columbus Medical College (Ohio), March 4, 1881. Immediately thereafter he began practice in Fenton, Michigan, and continued there until June, 1886, when he moved to Alma, Michigan. Dr. Brainerd makes a specialty of surgery, and is a ready operator in any field, doing an amputation, a resection, a plastic operation, a laparotomy or a cataract operation with equal facility. In 1888, he read a paper on "Colles's Fracture," before the Gratiot County Medical Society, and exhibited a splint that he had designed for the treatment of this accident. The paper (illustrated) was published in the *American Lancet*, April, 1888. In 1891 he presented a paper to the American Medical Association, on "Some Clinical Experiences with Eucalyptol," setting forth his original research with that drug. Other published papers of his, in the leading medical journals of

I. N. Brainerd

recent date, are entitled: "The Identity of Diphtheria and Membranous Croup," "Tuberculosis of the Lung," "Pilocarpus," "Croupous Pneumonia," "Insanity," "Pus," "Philosophy in Catharsis," "Hystreria" (*Medical Bulletin*, 1889); "Hydro-sarcocele," "An Attempted Resection of the Stomach," "How I Have Cholera Morbus," "Expert Testimony?" "The Mineral Waters of Gratiot County, Michigan;" "The Mineral Waters of Ypsilanti, Mount Clemens, and Eaton Rapids, Michigan;" "Simplicity and Efficiency in the Antiseptic Dressing of Wounds;" and "Acute Miliary Tuberculosis" (Transactions Michigan Medical Society, 1892). Dr. Brainerd was Professor of Natural and Physical Sciences in Fenton Seminary, Fenton, Michigan, from 1881 to 1885; and he held the same chair in the Eastern Michigan Normal School during its last year (1885) in Fenton, and its first year (1886) in Alma. He is

the author of "A Syllabus of Forty Lectures in Physiology," "A Syllabus of Forty Lectures in Physics," "A Syllabus of Forty Lectures in Chemistry," "A Syllabus of Thirty Lectures in Zoology," and "A Key to Robinson's New Elementary Algebra." Dr. Brainerd is a member of the Saginaw Valley Medical Club, of the Michigan State Medical Society, and of the American Medical Association.

BRAYTON, Alembert Winthrop, of Indianapolis, Ind., was born in Avon, New York, March 3, 1848. His father, Elijah F. Brayton, a native of New York State, now living in Chicago, is of Scotch ancestry, and is possessed of the natural and inherent instinct of that race for education and religion. In his early life he was a lumberman of the romantic Lake George region, and later the village miller of Pike, Wyoming county, also in New York. His mother, Helen Parker, is of English descent, a Vermont Puritan. From her the subject of this sketch learned to read at so early an age he does not remember the time when he could not read, and never to the present time saw her sit down to rest without a book or paper in her hand. That he might withdraw a family of five sons from the enforced physical idleness and demoralizing intellectual frivolities of a petty village life, his father, in 1856, submerged his family of five sons, of whom the subject of this was the second, in the billowy meadows and corn fields on an Illinois farm in Kankakee county, fifty miles south of Chicago. The country was fenceless and treeless; wolves and rattlesnakes were common, but were little feared, and the red deer at times still gathered in the fields, and might have been shot from the doorway. But hunting wild game was not taught on this farm; the early feet of the lads trod the early furrow, planting half-mile rows of "sod corn," and harrowing in spring grain. Thirty acres of corn from the seed to the crib, was the yearly stint of a twelve year old boy on an Illinois farm. Thus the years passed in seclusion; reflection and observation were developed; life was introspective, temptation was almost unknown, and the struggle between vice and virtue, so characteristic of city life, was reduced to a minimum. On the first day of the week, at 8 o'clock in the morning, the entire family emerged from this grassy and cereal seclusion and in a farm wagon crossed the open prairies to the Manteno Methodist church, where Sunday-school, preaching and class meeting crowded the hours from nine o'clock till past noon. Sunday-school books were exchanged, and by two o'clock the farmers were again secluded in their corn fields, the cob-fires were lighted, the best meal of the week prepared, and the remainder of the day passed in reading. A few weeks too inclement to husk corn in the open field were occupied at the district school. This, with the Sunday-school books, and such better literary works as the more intelligent farmers—mainly New York and New England people—bought and exchanged with each other, and the excellent collection of the Illinois Township Library, constituted the educational opportunities and material. The books were supplemented in the Brayton home by Horace Greely's *Weekly Tribune*, the *New York Christian Advocate* and *Journal*, the *Ladies' Repository*, and the *Atlantic Monthly*. It may be said

upon the whole that the material was ample and of a high grade. Times were hard and amusements were primitive and limited. Spelling schools, corn husking bees, the county fair, quarterly meetings, the national holidays, and an occasional trip to the river for fish or to mill, or for a load of wood varied the monotony of this life in the furrow or corn rows. The corn was worth ten cents a bushel and so was used for fuel; yearling calves were worth one dollar, butter seven cents a pound, and prairie hay twelve shillings a ton; life was, as a matter of course, correspondingly reduced to the simplest elements of food, shelter and clothing. The main value of such a boyhood is probably in its lessons of endurance, solitude and independence, of how little is absolutely necessary to maintain life decently, comfortably and honorably. The moral and religious features of it were, as has been intimated, dominant. Ever before the family was kept a sense of the invisible world of which this life of daily toil and privation was but the threshold, a world of transcendent joys which the universe prepares for virtue, and this beatific vision was projected upon a dark background of unspeakable pain and misery, the eternal brand fixed upon evil doing. Life was not to be lived on its own account; it was not a matter of pain or of pleasure, but serious business with reference to a future of which much was believed and but little known. This Scotch-Puritan serious view of life was intensified by the political issues of the time, the extension of slavery and the final advent of the civil war. It might have been over harsh and somber; it at least enforced the great underlying law of moral progress; that every man's deed comes home to himself, and aside from all purely traditional belief in a system of future rewards and punishments the greatest safety and happiness of the individual is in right thinking and right acting. In 1863 the family moved to Blue Island, a few miles south of Chicago, and this growing city was thereafter a great factor in the experience and education of its members. The Blue Island High School was completed in three winters and from this Dr. Brayton and his brothers passed to the Cook County Normal School, located at Englewood, Ill., and so came under the daily tutelage of that most thorough, fascinating and successful of Western educators, President Wentworth, the founder of the Chicago school system, and of the Chicago and Cook county Normal schools. From this school Dr. Brayton graduated in 1879, and at once became principal of the Glencoe schools, a northern suburb of Chicago. The following year he was elected Professor of Natural Science in the Normal School, but determined to first take a course in Cornell University, Ithaca, New York. Cramped in finances by the Chicago fire, Dr. Brayton left the University at the completion of the Sophomore year, and took up the work of biological teaching in the Normal school. In January, 1877, at the earnest solicitation of President David S. Jordan, now of Leland Stanford Junior University, but at that time Professor of Natural Sciences at Butler University, and who had been a classmate and instructor of the doctor's at Cornell University, Dr. Brayton came with his family to Indianapolis for permanent residence, and at once interested himself in zoological researches with Prof. Jordan. He also

completed his university course taking the degree of Bachelor of Science at Butler University. The degree of Master of Science was afterward conferred both by the State University at Bloomington, Ind., and by Purdue University at Lafayette, Ind., on account of meritorious work done in zoology. Several contributions were made to zoological literature within the next three years. In the summer of 1877, in company with Profs. D. S. Jordan, Chas. Gilbert, and a party of college students, the Southern Alleghany Mountain region was visited in the interests of ichthyological science under the auspices of the United States Fish Commissioner, Dr. Spencer F. Baird. All the streams were seined from Greenville, South Carolina to Atlanta, and from Atlanta to Chattanooga and west to Nashville. Some twenty species new to science were discovered and were described and published mutually by Prof. Jordan and Dr. Brayton in *Bulletin Number Twelve of the United*

A. W. Brayton.

States National Museum. The following summer was also spent with Profs. Jordan and Gilbert in extending these researches, and in collecting marine fishes at Beaufort, North Carolina, and in studying for comparison in the Smithsonian Institution the collection of the government. These Southern collections and researches furnished material for the study of the distribution of fishes of the Southern Alleghany region, a problem of the highest zoological interest and one to which Prof. Agassiz had directed Dr. Jordan's attention. In 1879 Dr. Brayton contributed a list with copious notes both scientific and literary upon the "Birds of Indiana," which was published in the annual report of that year of the Indiana Horticultural Society. This list occupied seventy-five pages, and is still in great demand among ornithologists although now out of print. It is the most useful, sympa-

thetic and appreciative list yet made of the birds of the State. In 1882 appeared the Fourth Volume of the Geological Survey of Ohio, devoted to zoology, and to which Dr. Brayton contributed the "Report on the Mammals of Ohio," occupying 175 pages. This work occupied the spare leisure hours of the years 1880 and 1881. Dr. Brayton's purely medical studies, commenced in Chicago, were resumed in Indianapolis, and in 1879 he took the degree of doctor of medicine from the Medical College of Indiana. The following autumn he was elected Professor of Chemistry, Toxicology and Medical Jurisprudence in the College of Physicians and Surgeons of Indianapolis, giving two full courses of lectures of eighty hours each, and doing considerable expert work in criminal toxicology and allied cases in medical jurisprudence. In the fall of 1881 he was elected Professor of the same subjects in the Medical College of Indiana. After four years of exacting work in chemistry he was elected to the chair of physiology in the same institution, and two years later was elected Professor of Pathology, Clinical Medicine and Dermatology, which chair he now holds, having been teaching some branch of medicine continuously since 1879. He has been on the consulting, clinical and teaching staff of the Indianapolis City Hospital and Dispensary since commencing the practice of medicine, devoting himself particularly to diseases of the skin and holding frequent skin clinics at these institutions. The result has been that for the first time in the history of these charities skin diseases have received the attention of an expert and competent diagnostician. Several unique cases were found at these clinics—one of favus of twelve years duration, the first ever shown to medical classes in Indianapolis. Another rare find was a case of Kaposi's strange disease, xeroderma pigmentosum, of which less than sixty cases are known in dermatological literature and but fourteen in the United States. This case was sixteen years old and lived near the city. A brother had died of it, under the belief among many medical advisers that it was lupus, or cancer. A baby sister developed the disease, making three in the same family. Seven thousand chromolithograph plates of this case were published in the various journals; four thousand in the *Journal of Cutaneous and Venereal Diseases*, for April, 1892; one thousand five hundred in the Proceedings of the Indiana State Medical Society, and two thousand in the September (1892) issue of the *Indiana Medical Journal*. By comparison with this report a case, nine years old, was found in southern Ohio. A case of Hebra's rare form of scabies (*scabies norvegica*) was also reported at length in the November (1892) *Medical Journal*, in connection with Dr. Robert Hessler, of Indianapolis, who reported the case to the Indiana Academy of Science and to the *American Naturalist*. The microscopical examination of this man's scaly skin revealed 7,000,000 egg cases of the mite and 2,000,000 of mites. The scales were an eighth of an inch thick, covered the entire body except the scalp, and had been accumulating four years, the prevailing diagnosis being syphilis, or scaly eczema. Dr. Brayton has a constantly increasing consultation business in this line of work, to which he has devoted much thorough work and painstaking

investigation. Dr. Brayton has been a faithful attendant of the Marion County Medical Society, to which he has contributed numerous papers and discussions. He has been both secretary and president of this society, and member of the Indiana State Medical Society. He has edited the Proceedings and Transactions of the State Society for the last five years. Since the establishment of the *Indiana Medical Journal*, September, 1892, by Dr. Frank C. Ferguson, Dr. Brayton has been almost continuously a member of its editorial staff, and when this journal was purchased by a stock company, in April, 1892, Dr. Brayton was unanimously elected its editor-in-chief, a position he still holds, and for which he is peculiarly adapted. Under his editorship the journal has greatly increased its range and usefulness, and has become the recognized organ of the medical profession in the State of Indiana. As a sign of its popularity, it may be noticed that it numbered over seventy different original contributions from the State of Indiana alone. It is rapidly becoming one of the leading State medical journals of the west. Dr. Brayton was for six years on the editorial staff of the *Indianapolis Daily Journal*, limiting his writing to medical, educational and scientific topics. He conducted for several years classes in biology in the Indianapolis High-school, and always took a great interest in scientific education, making addresses before college and other scientific societies, and always urging young men to take full courses in colleges and universities. He has been a member of the Gentleman's Literary Club and the Contemporary Club, of Indianapolis, and of other organizations devoted to the advancement of the social and intellectual life of the community.

BRENNAN, E. J., of Indianapolis, Ind., was born in the city of Kilkenny, Ireland, June 13, 1849. His father was Michael Brennan and his mother Hanora (Walsh) Brennan both of well known families in that country. The subject of this sketch was brought to Buffalo, N. Y., when he was six months old. As he grew up he was placed in the school of the Christian Brothers where he pursued his education until about sixteen years of age. He then began the study of medicine in the Hospital of the Sisters of Charity, and next attended lectures at the Buffalo University of Medicine for five years, graduating at that institution in 1871. He then began the practice of his profession at Lockport, N. Y., where he remained two years. During this time he was also health officer of the city, and was married to Miss Susan, daughter of John Graham, Esq., a prominent and successful merchant of Rochester, N. Y. He next practiced medicine four years in the latter city, but removed to Indianapolis, Ind., in 1876, where he has been engaged in active professional duties ever since. He became a member of the faculty of the Central College of Physicians and Surgeons of that city in 1882 by election to the chair of Diseases of Children, and in 1884 was appointed to the chair of obstetrics and clinical midwifery which he still holds. Dr. Brennan is a member of the staff of the city hospital and city dispensary as well as that of the St. Vincent's Infirmary. He is also a physician to the House of the Good Shepherd. While he was established in his profession in New York, he was a member

E. J. Brennan.

of the Niagara and Monroe County Medical Societies of that State. He is a member of the Marion County and Indiana State Medical Societies. He was for two years a member of the Indianapolis Board of Health, and for four years Supreme Medical Examiner of the Catholic Knights of America. He is a contributor to medical literature on subjects relating to his special branches of the profession. Dr. Brennan is noted for his kind and unassuming traits of character and for his success in the practice of his profession as well as in the capacity of a medical teacher. He has many friends both in and out of the line of his avocation.

BRIGGS, Waldo, of St. Louis, Mo., son of Professor Wm. T. Briggs, of Nashville, Tenn., and Dean of the University of Nashville, was born July 2, 1854, in Bowling Green, Ky. His academic education was received at the University of Nashville and Vanderbilt University, from which institution he received the degree of doctor of medicine, in March, 1876, having been awarded the gold medal for his proficiency in anatomy. After remaining a few months in his native home, the doctor, at the earnest solicitations of Professor A. P. Lankford, at that time Professor of Surgery in the Marine Medical College, removed and located in St. Louis, Missouri, to serve as his assistant. After several years of active service to this able and distinguished surgeon, he was appointed to and accepted the chair of Operative and Minor Surgery in the St. Louis College of Physicians and Surgeons. Two years were spent in this institution. At the expiration of which time, Professor Briggs, with several other prominent physicians, founded and incorporated the institution that is now known as the Beaumont Hospital Medical College, the doctor assuming the chair of Clinical Surgery and Genito Urinary Surgery.

He was still further honored by being elected secretary of the said institution; and the prominence attained by this school of medicine can be largely attributed to the executive ability displayed by him in its infancy. In September, 1883, he was again honored by the board of health of the city of St. Louis, then in session, by being appointed Consulting Surgeon to the City and Female Hospitals, which position he has filled with credit, and still retains. Among the surgical instruments devised and given to the profession at large, may be mentioned the Briggs' phimosis forceps, trachea dilator, and trocar—all of which are extensively used in the western country. Among the original articles reported may be mentioned "Extra Abdominal Intestinal Surgery," and the "Use of Animal Membrane as Grafts," as reported in the *St. Louis Medical and Surgical Journal*, and read before the St. Louis Medical Society. Also a new method of operative procedure for hypospadias. Among the many clinical cases reported, may be mentioned the operation for renal calculus, by the lumbar method; a remarkable case of fifteen days' suppression of urine from an impacted renal calculus; the successful removal of a greater portion of the pancreas, with recovery; the removal of an enormous osteo chondroma of the lower jaw, by excision of the inferior maxillary, with recovery; and many others too numerous to mention. Since the conclusion of this article, Professor Briggs has accepted the appointment of consulting surgeon to the Women's Hospital of St. Louis.

Waldo Briggs

BRIGGS, William Thompson, of Nashville, Tenn., son of Dr. John M. and Harriet Briggs, was born at Bowling Green, Ky., December 4, 1828. He was educated at the Southern College, Bowling Green, and at the Transylvania University, and graduated M. D. from the

latter in 1849; practiced for two years at Bowling Green, and in 1851 established himself in Nashville. Among his notable cases may be mentioned: successful ligation of the internal carotid artery for traumatic aneurism, 1871; successful removal of entire upper jaw for gunshot injury, 1863; successful removal of entire lower jaw for gunshot wound, same year; hip-joint amputation for elephantiasis arabum, leg weighing eighty pounds, 1875; fifteen cases of trephining in epilepsy, all cures but one, nodeaths; ninety cases of lithotomy, four deaths, last fifty (by the medio-bilateral method) all successful. He was elected demonstrator of anatomy in the University of Nashville; adjunct professor of anatomy, professor of physiology, professor of obstetrics and professor of surgery in the same institution, and is also Professor of Surgery in the Vanderbilt University of Tennessee, the latter professorship he continues (1893) to hold. He is a member of the Tennessee State Medical Society; of the American Medical Association, vice-president in 1872, and of various local professional organizations. His more important publications are: "History of Surgery in Middle Tennessee;" "Tetanus treated by Chloroform;" "Enchondromatous Tumors of the Hand, Forearm and Arm;" "Successful Amputation at the Shoulder-Joint;" "Traumatic Aneurism of the Internal Carotid, the Result of a Puncture, Ligation of the Common Carotid and then of the Internal at the Seat of Injury;" "Death from Chloroform;" "Escape of Catheter into the Bladder during its Use for the Relief of Retention;" "Unilocular Ovarian Tumor, Operation, Recovery;" "Dislocation of the Radius and Ulna backwards in a patient two and a half years old;" "Multilocular Ovarian Tumor—Tapped more than fifteen times; extensive Parietal Intestinal and Vesical Adhesion; Incision eight inches long; weight of tumor eighty-five pounds, recovery;" "Trephining in Epilepsy;" "Dugos' Pathognomonic Symptom in Dislocation at Shoulder-Joint;" and "The Trephine; Its Uses in Injuries of the Head."

BRIGHAM, Brayton Alvaro, of Chicago, Ill., was born at Mannsville, New York, January 1, 1863. His parents, having met with reverses, he, early in life, was obliged to rely chiefly upon his own efforts to aid him in securing an education; among other things working in the harvest field for twelve dollars per month to secure sufficient funds to attend the winter sessions of a course at Hungerford Collegiate Institute of Adams, N. Y. At the age of seventeen he taught school in one of the most refractory outlying districts in Northern New York, being the only one of several in succession to begin and complete a winter term in that district. Of evenings, in addition to his duties as a country school master, he gave class instruction in vocal music in some of the neighboring townships; besides which, by persevering night study, he kept pace with his class in college. It had been his desire and intention to obtain degrees from the literary and medical departments of Harvard; but two years of such overwork, with a diet of pork, potatoes and corn bread for breakfast; potatoes, corn-bread and pork for dinner; and for supper, corn-bread, pork and potatoes, impaired his health to such an extent as to force him to abandon further study for the time and visit the sanitarium, at Bat-

tle Creek, Mich., for treatment. Becoming convinced that his health would not permit of the hard work necessary to the fulfillment of his desires, he at once entered upon the study of medicine, with Dr. W. B. Sprague as his preceptor. After three years of sanitarium experience and study, he entered the College of Physicians and Surgeons of Chicago, graduating in 1886. While a student here he was assistant to the gynecologist of the dispensary and prosector to the chair of anatomy, and after graduation was made clinical teacher of gynecology, resigning after four years of service. He was also elected lecturer on anatomy in the spring of 1889, which chair he held until the practice of having a separate faculty for the spring session was abolished. When the Harvey Medical College was founded in 1891, he accepted, for the junior year, the chair of physiology, and with the establishment of a senior class became professor of gynecology, which chair he now holds. Since graduation he has resided continuously in

Brayton A. Brigham.

Chicago, directing his chief attention to gynecology and is the originator of a vaginal speculum, a modification of Jackson's. He is the author of "The Sexual Organs as a Factor in the Etiology of Nervous Diseases;" "What Dietary Shall I Prescribe?" "Religion and Medicine," and "A Digest of Gynecology." Being very fond of music he has also found time to harmonize several popular compositions, besides having written a number of original songs of merit. He is a member of the American Medical Association, Chicago Medical Society, and several other local organizations.

BRINTON, Daniel Garrison, of Philadelphia, was born in Chester county, Pa., May 13, 1837; graduated at Yale College in 1858; and M. D. at Jefferson Medical College in 1860. After spending about a year in Europe he returned and entered the army as acting assistant surgeon, August, 1862. He was commissioned surgeon of United States volunteers, February, 1863, and reported to the army of

the Potomac; was assigned to duty as surgeon-in-chief of 2d division Eleventh Army Corps, with which he was present at Chancellorsville, Gettysburg, and in a number of minor engagements. In September, he was sent with a corps to Chattanooga, and participated in various engagements as medical director Eleventh Army Corps, to which he had been appointed, October, 1863. A sunstroke, received directly after the battle of Gettysburg, disqualifying him for field service, he was appointed superintendent of hospitals at Quincy and Springfield, Ill., where he remained until he was discharged, with the rank of brevet lieutenant-colonel, August, 1865. In 1867 he became assistant editor of the *Philadelphia Medical and Surgical Reporter*, and subsequently its editor; also editor of the *Half-Yearly Compendium of Medical Science*. In his editorial position he has contributed much to medical periodical literature, and has also written a variety of works on historical, antiquarian, and philosophical subjects. Among his principal productions the following may be mentioned: "The Floridian Peninsula—its Literary History, Indian Tribes, and Antiquities," 1861; "The Shawnees and their Migrations," 1866; "The Myths of the New World—a Treatise on the Symbolism and Mythology of the Red Race of Americans," 1867; "MSS. in the Languages of Central America in the Library of the American Philosophical Society," 1868; "Guide-book to Florida and the South," 1869; "The National Legend of the Chatha-Muskokee Tribes," "The Phonetic Alphabet of Yucatan," 1870; "The Arawack Language of Guiana in its Linguistic and Ethnological Relations," 1871; "Contributions to a Grammar of the Chatha-Muskokee Dialects," Proceedings American Philosophical Society, 1872; "The Religious Sentiment—a Contribution to Science and Philosophy of Religion," 1876. He is also one of the authors of the eclectic series of geographies published in Cincinnati, and has edited "Naphey's Therapeutics," and various other medical works.

BROWER, Daniel Roberts, of Chicago, Ill., was born in Philadelphia, Pa., October 13, 1839. He is of Holland descent on his father's side; his ancestry were of the early Dutch settlers of this country. On his mother's side he is of English nationality. His preliminary education was received at the Polytechnic College, Philadelphia, whence he was graduated in 1860. He then studied medicine, under the preceptorship of Dr. Noble Young, of Washington, D. C., and attended courses of lectures at the Medical Department of Georgetown University, Washington, D. C., from which institution he obtained his medical degree in 1864. Shortly before graduation he passed the army medical board of examiners, and was commissioned by President Lincoln assistant surgeon United States volunteers, and was soon after assigned to duty at the United States General Hospital, Portsmouth, Va. Dr. Brower remained in the army in staff and hospital service until 1866. He then organized, under the Freedman's Bureau, the Howard Grove Hospital, Richmond, Va., for the cure of insane freedmen. In 1868 he was elected medical superintendent of the Eastern Lunatic Asylum of Virginia, and served in that capacity until the autumn of 1875, when he removed to Chicago, Ill., and has since continued there in practice, which has been mainly in the line

of mental and nervous diseases. He has devoted much time to the study of geology, mineralogy and botany, and has been a frequent contributor to the current medical literature, especially in the department of neurology. He was appointed physician to the department of mental and nervous diseases, in St. Joseph's Hospital, Chicago, in 1876, and was made professor of diseases of the nervous system in the Woman's Medical College, of Chicago, in 1877, professor of mental and nervous diseases in the Chicago Post-graduate School, in 1889, and was chosen professor of mental disease, materia medica and therapeutics in the Rush Medical College in 1890. Dr. Brower is also consulting physician to the Washington Home, to the Hospital for Women and Children, and the department of diseases of the nervous system in the Presbyterian Hospital. He is

D. R. Brower

ex-president of the Chicago Medical Society, vice-president of the Illinois State Medical Society, and president of the Medico-Legal Society of Chicago. He was married May 15, 1868, to Eliza Ann Shearer, of Pennsylvania, who has borne him two children, a daughter and son, the latter bears his name.

BROWN, Buckminster, of Boston, Mass., was born in that city July 13, 1819, and died there December 25, 1891. He was the son of Dr. John B. Brown, who introduced subcutaneous tenotomy into New England, and the grandson of a distinguished physician who resided in the vicinity of Boston. His maternal grandfather was Dr. John Warren, first Professor of Surgery in Harvard College, and his granduncle, Dr. Joseph Warren, General in the War of the Revolution, was killed at Bunker Hill in 1775. He graduated at Harvard Medical College in 1844, and settled in Boston

after traveling in Europe in 1845 and 1846, continuing the prosecution of his studies and turning his attention especially to orthopedic surgery under the guidance of Dr. W. J. Little, of London, Drs. Jules Guérin and Bouvier, of Paris, and Prof. Strohmeier, in Germany, and visiting the large establishments in England, France and Germany. To this branch of the profession, after several years general practice, he gradually devoted his chief attention. He operated successfully upon diseased and angular hips, contracted knees and club feet, and invented an apparatus for the treatment of hip disease as well as for spinal deformities and deformed knees, bow legs and club feet. He was a member, and was formerly librarian, of the Boston Society for Medical Improvement, member, and formerly treasurer, of the Boston Medical Association, of the Massachusetts Medical Society and of the Suffolk District Medical Society. He was surgeon for many years of the House of the Good Samaritan. He contributed to leading medical journals papers on "Carious Disease of Cervical Vertebrae," with a notable case and a minute description of post-mortem appearances and fractured odontoid, "Cases in Orthopedic Surgery," with photographic plates, "A Memoir of Dr. John Warren," published in "Lives of Eminent American Physicians and Surgeons of the Nineteenth Century, edited by Dr. S. D. Gross." In May 1864, he married Sarah A. Newcomb, a great-granddaughter of Gen. Joseph Warren.

BROWN, Joseph Bullock, was born in New York city, July 26, 1822, and died at Albion, N. Y., October 21, 1891. He was appointed assistant surgeon United States army, June 29, 1849; was promoted to the rank of captain five years later, and to that of major and surgeon July 4, 1861; and lieutenant-colonel, June 30, 1862; was brevetted colonel March 13, 1865, for faithful and meritorious services during the rebellion, and brigadier-general, September 28, 1866, for distinguished services at Fort Columbus, New York harbor, during the cholera epidemic of that year, and was retired June 30, 1882. During the civil war he served chiefly with the army of the Potomac and the army of the Cumberland. He was appointed president of the United States examining board in New York city, in 1873, and held the position until his retirement, having served in the medical department of the army thirty-three years.

BROWN, John Wing, of Mottville, N. Y., was born in the city of New York, April 17, 1852. Owing to ill health of his father he removed in 1860 to Brocketts Bridge, now Dolgeville, N. Y., where his childhood was passed. His education was obtained in the village school, and academies in Pulaski and Fairfield, N. Y., varied during vacations by clerkship in his father's store. Leaving school he entered the office of Dr. A. Y. Barney, in Dolgeville, and upon his nineteenth birthday he attended lectures at Ann Arbor in the winter of 1871, and received the degree of M. D. upon March 26, 1873, from the University of Michigan. He married M. Alice Youker of Dolgeville, April 9, 1873, and the following month entered a partnership with his preceptor. This arrangement continued until December, 1875, when he removed to the town of Skaneateles, and located at Mottville, N. Y., and began what has proved his life work. A bitter strug-

gle with adversity and poverty for a few years and perseverance and energy won the large and lucrative practice he now enjoys. Early developing ability with obstetrical cases (a record of 910 with two fatalities) his advice and counsel is sought for miles around. Recognizing that the growing importance of nervous and special ills of women were not alone the province of the specialist a large and growing "clientele" is the result of this study and foresight, and as trained nursing with attention to detail is so essential in their cure, he is now arranging for a private sanitarium, where a limited number may receive all the comforts of home with the thorough personal supervision impossible in the larger institutions. Dr. Brown is the type of the thorough all-round general practitioner, and noted for his cheerful demeanor and personal magnetism. His robust physique alone enables him to withstand the arduous duties of the country doctor. Located in a manufacturing community, the major and minor surgical work has been his for years, and operative gynecology is of frequent occurrence. His adoption of wood pulp as a dressing for fractures was original, and his claim for priority is uncontested, as its advantages has been ably stated by him at county, State, and National medical meetings. He has been health officer of his town for years. Early attaining a membership in the Herkimer County Society, he united upon his removal with the Onondaga County, and was its president for the year 1891. He is also a member of the Central New York Medical Association, New York State Medical Society and American Medical Association. His meager contributions to literature are a report upon "Diphtheria" in *American Journal of Obstetrics* and subsequent report to American Medical Association Transactions, "Wood Pulp as a Surgical Dressing," "A Plea for the General Practitioner versus Gynecologist," *American Medical Association Journal*, and presidential address upon "Decadence of American Families." His restless activity early led to his organization, with others of the Mottville Paper Company, Limited, of which he has always been the president and resident manager. He also became a "granger," and successfully manages a farm in connection with his residence. He is a member of Skaneateles Lodge, 522, F. and A. M., Chas. H. Platt Chapter 247, R. A. M., Central City (Syracuse) Commandery, 25, K. T., and has obtained the Thirty-second Degree A. A. S. R. Possessing one of the finest residences in the town, and a library among the best in the county, surrounded by his family of father, mother, wife, three daughters, and one son, and well equipped by personal experience, he ably enjoys these results of application, and hopes to long retain his place with the workers of his chosen profession.

BROWN, Moreau Roberts, of Chicago, Ill., was born in Galveston, Texas, July 26, 1853, and is of English and German descent. He was educated in Pennsylvania and began the study of medicine under the preceptorship of Drs. Joseph and William Pancoast, of Philadelphia, and was also a student with Drs. David Yandall of Louisville, and Chas. Ganahl of Galveston. In 1876 his medical degree was received from the medical department of the University of Louisville, and was highly complimented by the members of the faculty

on the examination passed at the time of his graduation. He went abroad subsequently and supplemented his medical education and training by two years' attendance at the schools and hospitals of Germany and Austria. In 1881 he took special courses of study under Professor Henle, the noted anatomist; Koenig, the surgeon; and Schwartz, the gynecologist, at the University of Gottingen, Germany. In 1882 he continued his studies with Schnitzler, Schroetter, and other laryngologists and also with the ophthalmologists and surgeons at the hospital and university in Vienna, Austria. In 1883 he was at Munich with Oertel and Sclicch receiving instruction in laryngology and also with Ziemssen and others in medicine and ophthalmology. On returning from Europe he established himself at Galveston, Texas, where he was engaged in practice for a period of eight years. In 1877 Dr. Brown was made surgeon of the Washing-

Morzan P. Brown

ton Guards, a military organization of his native city, and served in that capacity about four years, and later he served one year as surgeon of the Galveston artillery. He was also physician of Galveston county from 1876 to 1879, and quarantine officer of Galveston for three years ending in 1881. In 1879 yellow fever was kept out of Texas, for the first time, when it was epidemic in Louisiana, mainly by the efforts of the Galveston board of health, of which Dr. Brown was the executive officer, and the independent sanitary officer of his State. He has had several years' experience in the treatment of this terrible malady, while engaged in general practice, and during the rebellion, even when a mere boy, too young to enter the army, did much in the capacity of nurse to relieve the troops' suffering during epidemics of

yellow fever. He has relinquished general practice, and has for some time devoted his entire attention to diseases of the throat and nose, and has taken courses of instruction from the world's greatest specialist in this line, Mackenzie, of London, who tendered him the position of his assistant, in 1893. Dr. Brown's greatest professional success has been in intra-nasal surgery as an operator. He is now Professor of Laryngology and Rhinology at both the Chicago Polyclinic and College of Physicians and Surgeons of Chicago, also Secretary of the former. He is a member of the Illinois State, and Chicago Medical Societies. He has devised a nasal saw, snare, tubular knife, and enchondrotome in the past few years, and has contributed to current medical literature a number of important articles on the "Throat" and "Nose," and particularly on "Diseases of the Antrum."

BROOKS, John G., of Paducah, Ky., was born October 5, 1840, in Montgomery county, Tenn., and is of English descent. He graduated from the Jefferson Medical College, Philadelphia, in March, 1868, and settled at Paducah; going thence to the island of Mani, in the Hawaiian kingdom, from which he returned to the city of his present residence. His practice includes two cases of traumatic tetanus, successfully treated by large doses (two and three grains) of sulphate of morphia, administered hypodermically. He is a member of the Paducah Medical and Surgical Society; the Southwestern Kentucky Medical Association; ex-president of the Kentucky State Medical Society; and permanent member of the American Medical Association; has been three years city physician of Paducah, and is now examining surgeon of the pension bureau. Since returning to America, he was offered by the Hawaiian government the position of traveling physician for the islands of Mani, Molokai, and Lamai, but declined the offer. He is now proprietor of Brooks Infirmary, for the treatment of patients requiring surgical relief.

BUCK, Gurdon, of New York, was born in that city May 4, 1807, and died there March 6, 1877. He was a son of Gurdon Buck, a merchant, and Susannah Manwaring, of Connecticut, cousins, both having been grandchildren of Governor Gurdon Sallonsall, of Connecticut. He fitted for college at Nelson's classical school in New York, and then went into business; but subsequently commenced the study of medicine with the late Dr. Thomas Cock, of New York, and graduated at the College of Physicians and Surgeons in 1830. After serving the regular term in the medical side of the New York Hospital, he spent two years and a half in professional studies in Europe, chiefly in Paris, Berlin, and Vienna. Returning from abroad towards the end of 1833, he settled in New York, where he continued to practice. In 1837 he was appointed visiting surgeon to the New York Hospital, which position he held for forty years. Dr. Buck was also appointed visiting surgeon to St. Luke's Hospital and the Presbyterian Hospital, and consulting surgeon to the Roosevelt Hospital, at the time of the organization of those institutions. From 1852 to 1862 he was visiting surgeon to the New York Eye and Ear Infirmary. He was the first to popularize the treatment of fractures by the use of the weight and pulley, now known as "Buck's Extension." He

was a member of the New York Pathological Society, of which he has been president; of the county Medical Society; of the State Medical Society; and of the American Medical Association; and has been a Fellow of the New York Academy of Medicine, from its organization, and once its vice-president. His professional writings, in addition to a work entitled "Contributions to Reparative Surgery," published in 1876 by D. Appleton & Co., include the following papers: "Researches on Hernia Cerebri Following Injuries of the Head;" "Excision of the Elbow-Joint in a Case of Suppuration and Caries of the Bones;" "The Knee-Joint Anchylosed at a Right Angle, Restored nearly to a Straight Position after the Excision of a Wedge-Shaped Portion of Bone, Consisting of the Patella, Condyles, and Articular Surface of the Tibia;" "Edematous Laryngitis Successfully Treated by Scarification of the Glottis and Epiglottis;" "A New Feature in the Anatomical Structure of the Genito-Urinary Organs not Hitherto Described;" "Six Additional Cases of Edematous Laryngitis Successfully Treated by the Scarification of the Glottis and Epiglottis;" "A Case of Croup; Tracheotomy Successfully Performed;" "On the Surgical Treatment of Morbid Growths within the Larynx, Illustrated by an Original Case and Statistical Observations Illustrating their Nature and Forms;" "A Case of Deep Wound of the Parotid Region, in which a Ligature was Simultaneously Applied to the Common and Internal Carotid Arteries;" "Badly United Fracture of the Thigh, Cases Illustrating Treatment;" "Post-Fascial Abscess, Originating in the Iliac Fossa, with a New Method of Treatment;" "Case of Aneurism of the Femoral Artery, for which Ligatures were Successfully Applied to the Femoral, Profunda, External and Common Iliac;" "Improved Method of Treating Fractures of the Thigh;" "Description of an Improved Extension Apparatus (by means of Weight and Pulley) for the Treatment of Fractures of the Thigh;" "On Abscess Originating in Right Iliac Fossa, with Table of Statistics;" "The Migration of Purulent Matter, and the Anatomical and other Conditions upon which it Depends." During the last thirty years of his life he had been, for varying periods, trustee of the College of Physicians and Surgeons of New York; of the New York Eye and Ear Infirmary; of the New York Dispensary; and of the New York Ophthalmic and Aural Institute.

BUCK, James P., of Chicago, Ill., was born in Carrollton, Pa., February 19, 1856. He is the son of the Hon. John Buck of said State. At the age of fourteen he entered St. Vincent's College, where he graduated with the title of M. A., in the year of 1875, when he took up the study of medicine under his brother, M. J. Buck, M. D., of Baltimore, under whose immediate supervision he began his first practical work in anatomy, at the Hahnemann anatomical rooms in Philadelphia, in the spring of 1876, but continued his studies in the regular school, and graduated at the Jefferson Medical College, in the spring of 1879, when he began the practice of medicine in western Pennsylvania. In 1885 he entered the University of Vienna, Austria. The following winter war broke out between Servia and Bulgaria, at which time he entered the Servian army, having received the brevet title of captain. After

having served for a period of three months he received an honorable discharge, and returned to the above-named institution. Later he went to Heidelberg, where he worked under Professor Arnold Zerny and others. The following fall he again returned to Vienna, at which place he held the chair of assistant on the eye, under Professor Hock, of the Polyclinic, for a

J. L. Buck

period of six months. He began the practice of his profession in Chicago, in 1887. He is a member of several clubs.

BUCKMASTER, Augustus Harper, of New York city, was born in Brooklyn, in 1859. His family have resided in the former city for many years. He is a great nephew of George Buckmaster, who was alderman of New York city in 1812, and who served on a committee of public safety at this time, when the relations with England were so hostile in character. On the maternal side he is of Scotch descent. He studied medicine with Professor John J. McCorkle, and graduated at Long Island College Hospital, and was an honor man of the class of 1883. He received the appointment of ambulance surgeon to the western district of Brooklyn, and resided at Long Island College Hospital in 1882-83. Receiving the appointment at St. Peter's Hospital, Brooklyn, he served on the house staff for eighteen months. At the expiration of this service, he was appointed house surgeon to the Woman's Hospital in the State of New York, and served during the years 1885-86. After leaving the Woman's Hospital he settled in Brooklyn, and became very much interested in the Brooklyn Pathological Society, of which he was secretary, and afterwards vice-president. He served as gynecologist to the southern Brook-

lyn Dispensary and to the Hospital for Nervous and Mental Diseases. In 1888, his "Essay on the Galvanic Treatment of Fibro-myomata" was awarded the prize offered by the Alumni Association of Long Island College Hospital. He received an appointment on the visiting-surgical staff of St. Peter's Hospital, in 1887, and resigned this position in 1890, when he removed to New York city, and was appointed assistant surgeon to the Woman's Hospital, on the service of Dr. Thomas Addis Emmet. In 1891, in conjunction with Dr. John Duncan Emmet, he first edited and published the *New York Journal of Gynecology and Obstetrics*, a special paper which has quickly won for itself the first rank among the special journals of its kind in the world.

BUCKMASTER, Samuel Bruce, of Chicago, Ill., was born at Lima, Allen county, Ohio, April 26, 1853. His family is an old American one, of English stock. One of the free hold-

S. B. Buckmaster

ers of Sudbury, Mass., in 1638, was a George Buckmaster. When eighteen years old, the subject of this sketch went to California, and taught school for three years at Yreka, in northern California near the lava beds, where the celebrated Modoc war occurred during the time of his residence there, Dr. Buckmaster going into the lava beds as a volunteer. He also helped to care for the bodies of General Canby and the other peace commissioners killed by Capt. Jack and his band of blood thirsty Modocs. Returning East, he began the study of medicine at Janesville, Wisconsin, with Dr. Henry Palmer, surgeon-general of Wisconsin, and graduated from the Medical department of the University of Virginia in 1879. He then attended the University of the City of New York, also taking special courses at Bellevue. In the spring of 1880 he received

the appointment of third assistant physician at the State Hospital for the Insane at Madison, Wis., and a year later was promoted to second assistant. Another year found him first assistant, and in July, 1884, when thirty-one years old, he was the unanimous choice of the State board of supervision of Wisconsin institutions for superintendent of the State Hospital. This position he held over five years, resigning in December, 1889, to give his children school advantages, the hospital being too far from the city, and taking up his residence in Chicago. While superintendent of the hospital, Dr. Buckmaster was credited with making many improvements in the manner of caring for the insane. He was the first in the West to adopt the non-restraint system, and in recognition of his work in this line was elected vice-president of the Medico-Legal Society of U. S. for Wisconsin, and his portrait was published in the group of twelve eminent American alienists given as a premium to subscribers by the *Medico-Legal Journal*. Upon engaging in practice in Chicago Dr. Buckmaster was elected adjunct professor of physiology in the College of Physicians and Surgeons and now holds the position of professor of medical and surgical electricity in the same institution. He is also President of the West Side Dispensary, which treats nearly 25,000 patients yearly. Dr. Buckmaster has read numerous papers before societies and contributes often to medical journals. He is a member of a number of medical societies, and also of the Loyal Legion of ex-officers of the United States army and navy during the war of the rebellion. This he has by inheritance, his father having been an officer of the war, dying from injuries received therein.

BUCKNUM, Amasa Mortimer, of Denver, Colorado, was born in Westford, Otsego county, New York, June 28, 1824. A few years after his birth his father moved to Michigan, and was one of the very earliest settlers in that region. His early education was obtained at Jackson Academy and at Olived College. At the age of twenty-four years he went to Albany, N. Y., and attended a course of lectures at the Albany Medical School. Professors Marsh, the Becks and McNaught were then connected with this school. From Albany he went to Castleton, Vermont; took lectures under Goldsmith, Ford and Perkins, and on June 3, 1849, he graduated from the Castleton Medical College. After graduation he began practicing medicine at Spring Arbor, Michigan, where he remained twelve years. During his stay here he was professor of Physiology in the Michigan Central College. From Spring Arbor he went to Parma, Michigan, and was in active continuous practice there for twenty years. In 1880 he was chosen president of the Jackson County Medical Society. In 1881, on account of his health, he came to Denver, where he is now engaged in his chosen work. For eight years he has held a position on the staff of St. Luke's Hospital, and for three years he has been connected with the Gross Medical College Dispensary as consultant. He is a member of both local and State medical societies, and also of the American Medical Association. While he attends to a large general practice, yet his special work is in gynecology. He has removed a large ovarian tumor successfully, and has performed every minor operation known to

the gynecologist. Though now well advanced in years, he lags not. He is a wide reader, has a large library and a vast collection of instruments. He is ever the young physician's friend and always ready to aid his interests and aspirations.

BUNCE, William H., of Oberlin, Ohio, was born in Paterson, N. J., June 29, 1830, and died February 13, 1892. He came of the ancient Scottish house of Kennedys, his mother being the only daughter of Sir Archibald Kennedy; the present head of the house being the Marquis of Ailsa. Dr. Bunce was educated at Oberlin College and studied medicine with his father, a Yale graduate, and one of the first regular practitioners in northern Ohio, and received his medical degree from the Cleveland Medical College in 1863. He was a surgeon during the war, was connected with a number of medical societies, and at various times held prominent positions in them. He was recognized as a leading surgeon of his section of the State. There was a peculiar gentleness in his ministrations to those who came under his care which made them feel he was not only their physician but their friend, and it may be well said that by his skill and worth he built up a monument for himself, that will live after him in the hearts that learned to love him. One son survives him, Dr. W. C. Bunce, who succeeds him in his practice.

BURGE, John Henry Hobart, of Brooklyn, N. Y., son of the Rev. Lemuel Burge, rector of the Protestant Episcopal church at Wickford, R. I., was born at Wickford, August 12, 1823. His preparatory education was received at home—his father had a widely extended reputation as an efficient tutor for young men preparing for college—and his professional education was begun under his grandfather, Dr. William G. Shaw, and uncle, Dr. William A. Shaw, well known practitioners of North Kingston, R. I. He attended his first course of lectures at the Harvard Medical School, and a second and third course at the University of New York, graduated M. D. from the latter institution in the spring of 1848. After graduation he spent a year in further study in New York, attending a special course of lectures at the New York Hospital—he had also attended a special course in 1847 under Dr. Aylett—and in clinical and office study. In February, 1849, he sailed as ship's surgeon to California, the company of emigrants of whom he had medical charge arriving in excellent health at San Francisco, after a seven months voyage. At Sacramento he opened a hospital in the cabin of the bark "Ann Welsh," in charge of which he remained until the vessel was sold in 1850. He subsequently practiced in Sacramento, assisting in founding the first medical society in that town, and in 1850 sailed for New York *via* the Isthmus of Darien. During a considerable portion of his homeward voyage he was called upon to deal with Asiatic cholera. Until 1855 he practiced in New York, being for two years attending physician to the New York Dispensary, and since 1855 has been established in Brooklyn. Between 1855 and 1858, in connection with his younger brother, Dr. Wm. J. Burge, he devoted much time to the experimental treatment of fractures, the result being the introduction of Burge's apparatus for fractured thigh; an appliance which, before the use of

extension by adhesive plaster, was of great importance. Since the almost universal introduction of this method of extension the doctor does not consider such an apparatus essential to good treatment, but with the substitution of the plaster extension for the screw, it may often be extemporized to advantage. The apparatus is not in the market. A description of it will be found in Hamilton on "Fractures and Dislocations." He has also introduced to the profession a new mode of treating fracture of the patella, a throat forceps and a pistol-ball extractor, and has engaged in a series of successful experiments in the use of horse-hair ligatures. He is a member of the American Medical Association; of the New York State Medical Society; of the Kings County Medical Society, and was president in 1870 of the New York Neurological Society, and was also, in 1870, president of the Long Island College Journal Association. From 1858 to 1863 he was attending Physician to the Brooklyn Central Dispensary and has been visiting surgeon to the Long Island College Hospital thirty-three years, as well as consulting physician to the Sheltering Arms Nursery, consulting physician to St. John's Hospital for twenty-five years and still holds the last two positions. Of his professional publications may be mentioned the following articles: "On Fracture of Thigh;" "Hygienic Influences;" "Nature and Treatment of Croup;" "Mutual Relations of Physicians and Apothecaries;" "Infant Diet;" all of which have been regarded as valuable and practical contributions to medical literature.

BURR, Albert Henry, of Chicago, was born in Hancock county, Ill., August 19, 1850. He is of New England ancestry, and Puritan stock, having descended from Benjamin Burr, who came over with Governor Winthrop, of Massachusetts, in 1630. Dr. Burr received his preliminary education from the Northwestern University, Evanston, Ill., and received the degree of Ph. B. from that institution, in the class of 1877. He then began the study of medicine under the preceptorship of Dr. Thomas L. Magee, and was graduated M. D. at the Chicago Medical College, in the class of 1881. His medical education was supplemented by attendance in the department of the nose and throat of the Post-graduate Medical School of Chicago. In 1881 he located in Chicago to practice, where he has since been continuously engaged in his professional pursuits. He has given special attention to throat and nose diseases, though his practice is not yet limited to the specialties. He is a member of the Chicago Academy of Sciences, and has taken considerable interest in geology and anthropology. He has contributed important papers relating to genito-urinary surgery, and in 1881 he devised some valuable instruments for the treatment of gleet. Since 1891 Dr. Burr has delivered lectures on Laryngology and Rhinology in the Post-graduate Medical School of Chicago.

BURT, Rollin Thrift, of Pomona, Cal., was born in Mt. Vernon, Ohio, August 10, 1843. He graduated March 18, 1869, at New Orleans, La. He was first appointed acting assistant surgeon United States army, March 23, 1878; and again March 23, 1882, and served in the following places: Camp Supply, later Camp John A. Rucker, Fort Lord and Fort Huachuaca, Arizona. Reported April 6, 1878, at Fort

Whipple, Arizona; went to Fort Grant; thence in two weeks to Camp Supply, established near the Mexican line. Was post surgeon for more than one year, May, 1878, to October, 1878. Second service, was post surgeon for more than one year at Fort Lord, near Tucson, Arizona, for some three months. On the breaking out of the Apache Indians accompanied Captain Maddon, commanding the 6th Cavalry, consisting of two companies of Regular Cavalry and one of Indian scouts in the field. Returned in July to Fort Lord; afterwards transferred to Fort Huachuaca, where he served as assistant surgeon under Assistant Surgeon Gardiner. Accompanied troops on scouts, and was with Lieutenant Ducap on a survey of the boundary monuments between Arizona and Sonora. Accompanied Captain Thompson, 3d United States Cavalry, to station in Sulphur Spring Valley, in the spring of 1883, during an Indian war. He has contributed specimens to the Smithsonian Institute, and also articles concerning the ruins of an ancient town situated in the White River Cañon, Arizona. His service terminated July 15, 1883. In civil life he has held the position of health officer in Pomona, Cal., since 1887, and by the appointment of the board of supervisors the same position in certain portions of the country.

BUTLER, George Frank, of Chicago, Ill., was born in Monrovia, N. Y., March 15, 1857. He is of English descent. His paternal ancestors came to America in 1612. His mother is a lineal descendant of Samuel Chase, a signer of the Declaration of Independence. His early literary education was received at the Monrovia High School and Groton Academy in the State of New York, and was graduated from the latter institution when seventeen years of age. He accepted a position soon after in Brewster, and Rice's drug store, Pittsfield, Mass., where he remained more than three years, and then formed a co-partnership with Dr. Henry Millard in the drug business, in North Adams, Mass. His health failing in 1879, he sold out his interest in this business, and went to Denver, Colo., as manufacturing pharmacist in a wholesale drug house. Not improving in health he abandoned this avocation entirely, and in 1880 engaged in raising sheep in southwestern Kansas, but in 1882, on recovering his health, re-entered the drug business in Belle Plain, Kansas, forming a partnership with Dr. J. D. Justice, with whom he at once began a systematic study of medicine. In 1887 he entered Rush Medical College, Chicago, Ill., and was graduated from that institution in 1889, as valedictorian of his class. Dr. Butler was immediately offered a partnership with Dr. A. C. Cotton, with whom he remained one year. In 1889 he was appointed attending physician in the department of diseases of children, Central Free Dispensary, Chicago. In the spring of 1890 he was appointed Lecturer on Medical Pharmacy in Rush Medical College, and in the winter of 1890-91, he was appointed Lecturer on Materia Medica and Pharmacy in the Northwestern University, Women's Medical School. In 1891 he was appointed attending physician to the ear department of the Illinois Charitable Eye and Ear Infirmary. In 1892 he was elected Professor of Materia Medica and Pharmacy in the Northwestern University, Women's Medical College, and in

May he was appointed assistant city physician of Chicago. He is medical examiner for the Provident Savings Life Insurance Society and the Commercial Alliance Life Insurance Company of New York; Massachusetts Benefit Association of Boston, and the Prudential Life Insurance Company of Newark, N. J. Dr. Butler has contributed numerous articles to medical and pharmaceutical journals, and is a member of the American Medical Association, the American Pharmaceutical Association, and of the Chicago Medical Society.

BYFORD, Henry T., of Chicago, son of the late Dr. Wm. H. Byford and Mary Anne (Holland) Byford, was born in Evansville, Indiana, November 12, 1853. His grandfather, Hezekiah Holland, and his brother, the late Wm. H. Byford, Jr., were physicians. Dr. Byford graduated in medicine at the age of nineteen years, and then traveled with his invalid brother in Louisiana and Colorado until old

Henry T. Byford.

enough to practice. In 1879 he was attacked with sciatica, attributable to overwork, and went abroad for a year and a half. Upon his return he went again into general practice, but gradually gave up everything that interfered with the practice of obstetrics and gynecology. In 1882 he married Mrs. Lucy (Larned) Richard. Dr. Byford is connected with the College of Physicians and Surgeons of Chicago, Woman's Medical College and Post-Graduate Medical College of Chicago, is gynecologist to the Woman's and St. Luke's Hospitals, and consulting gynecologist to the Michael Reese, the Provident, and the Charity Hospitals. He is ex-president, and one of the founders of the Chicago Gynecological Society. His name is connected with several original methods of operating, and is associated with that of his father in the authorship of the last edition of their work on "Diseases of Women." Among his contributions to periodical literature may

be mentioned: "Functions of the Membranes in Labor;" "Treatment of Infantile Eczema and Allied Affections;" "Nervous Paroxysm," "De la Preservation des Membrane Durant la Deuxieme Periode du Travail" (*Annales de Gynecologie*, Paris); "Production and Prevention of Perineal Lacerations During Labor;" "Treatment of Retroversion of the Uterus by Operative Methods;" "Removal of Uterine Appendages and Small Ovarian Tumors by Vaginal Section;" "The So-called Physiological Argument in Obstetrics;" "Twelve Months of Abdominal and Vaginal Section;" "Another Twelve Months' of Peritoneal Section;" "A Year's Work in Peritoneal Surgery;" "Vaginal Hysterectomy;" "Vaginal Fixation of the Stump in Abdominal Hysterectomy;" "The Technique of Vaginal Fixation of Stump in Abdominal Hysterectomy;" "Lacerations of the Parturient Canal During Labor;" "Cases of Extra-Uterine Pregnancy;" "Unusual Cases of Abdominal Section;" "Vaginal Oöphorectomy," and others, besides numerous clinical lectures.

BYRD, Harvey Leonidas, of Baltimore, Md., was born at Salem, Sumter District, South Carolina, August 8, 1820, and died in the former city November 29, 1884. He was descended from English and Scotch-Irish ancestors, who early settled in this country, his paternal grandfather serving as a member of Marion's brigade during the revolutionary war. After receiving a classical education in South Carolina, and having the honorary degree of A. M. conferred upon him by Emory College, Georgia, he entered the Jefferson Medical College and subsequently the Pennsylvania College, graduating therefrom with the degree of M. D. in 1840, and again as an M. D. from the University of Pennsylvania in 1867. After graduating in 1840 he commenced the practice of his profession at Salem, S. C., subsequently removing to Georgetown, S. C., Savannah, Ga., and ultimately to Baltimore, Md., in which city he located and engaged in active practice. On removing to the last-named city, soon after the close of the war, he began a movement for the re-opening of Washington University, which had suspended operations for several years, with a view to the establishment of a prosperous Southern medical school. Dr. Thomas E. Burd, a member of the late faculty, concurring in the opinion that the time was propitious for such an enterprise, joined heartily in its consummation. Dr. Warren, and other gentlemen who had served in the Southern army, co-operating, the announcement of the opening of the school was issued over Dr. Byrd's name as dean of the faculty, and the school entered at once upon a career of almost unprecedented success. After about five or six years he withdrew from the school to join Drs. Warren, Goodrick, and others in the establishment of the College of Physicians and Surgeons of Baltimore. During his professional career he has held the professorships of *Materia Medica* and Therapeutics, and as dean of Savannah Medical College; of Principles and Practice and Clinical Medicine; also as dean of Oglethorpe Medical College, Ga.; of Obstetrics, and some time dean of Washington University, Baltimore; of Principles and Practice of Medicine, and of Diseases of Women and Children, of the College of Physicians and Surgeons, Baltimore, in which he has also held

the position of first president of its faculty. Among the many papers which he has contributed to medical journals, the more noteworthy are: "Muriated Tincture of Iron in Scarlatina;" "Yellow Fever;" "Combination Operation in Amputation;" "Speedy Method in Asphyxia of Newly-born Infants;" "Blood-letting in Disease;" "Quinia in Traumatic Tetanus;" and the "Physiological Impossibility of Descent of the Races of Men from a Single Pair." He is a member of the South Carolina Medical Association, Georgia Medical Association, Medical and Chirurgical Faculty of Maryland, Baltimore Medical Association, Epidemiological Society of Maryland (of which he was the first president), and corresponding member of the Gynecological Society of Boston, Mass. He edited the *Oglethorpe Medical and Surgical Journal* for three years, and was a member of several literary and scientific societies in addition to those mentioned above. During the late civil war he served as a surgeon in the Confederate army.

CABELL, James Laurence, of Overton, Va., was born in Nelson county, Virginia, August 26, 1813, and died August 13, 1889. He was graduated at the University of Virginia in 1833; studied medicine in Paris, and was elected Professor of Anatomy and Surgery in the University of Virginia, and was, in 1846, elected president of the Faculty. During the war between the States he was surgeon in charge of the military hospitals of the Confederacy. In 1878, he was chairman of the National Sanitary Conference, held at Washington, to consider the yellow fever that raged in the southern cities; and in 1879 was appointed a member of the national board of health constituted by Congress that year; was elected president by his associates, and retained the office until his death. In 1858, Dr. Cabell published "The Testimony of Modern Science to the Unity of Mankind;" and, in addition to this, he has contributed important reports and papers to the medical press.

CADWALADER, Charles Evert, of Philadelphia, Pa., was born in that city November 5, 1839. He is a son of John Cadwalader, a judge of the United States district court, and who was a brother of General George Cadwalader, favorite of the Philadelphia militia, who gained much distinction for his services in quelling the "native American riots" in Philadelphia (1844) and in the Mexican war, and the late civil war; founder of the "Union League" and first president of the "Loyal Legion of the United States, holding the office at the time of his death. Dr. Cadwalader is a grandson of Gen. Thomas Cadwalader of the war of 1812. His medical line of descent is of historical interest to the profession. Dr. Edward Jones and Dr. Thomas Wynne, the grandfather and great grandfather of his likewise distinguished progenitor, Dr. Thomas Cadwalader, were, with Dr. Griffith Owen (one of their family connection) the physicians who accompanied Wm. Penn (1682) and were among the latter's most trusted friends and advisors in the project taking a principal part in the foundation of the province. Dr. Jones conducted the first colony to Pennsylvania. Dr. Wynne who sailed with Penn and Dr. Owen in the "Welcome" was made president of the first assembly held in Philadelphia (1683) and was appointed by Wm. Penn judge of the supreme court of the province. Dr.

Jones was a member of the assembly, and Dr. Owen was a member of the governor's council. They held many important public offices and were men of the best cultivation in their profession. Dr. Griffith Owen, Jr., Dr. Evan Jones, and the latter's son, Dr. John Jones, the distinguished surgeon in the French war and of the Revolution, the physician of Washington and Franklin, were also their descendants. Dr. John Jones was Professor of Surgery in King's College, New York, from the time of its foundation (1767) and the author of the first American work on surgery (1795) which he dedicated to Dr. Cadwalader. Dr. Cadwalader Evans, another distinguished physician and one of the original physicians of the Pennsylvania Hospital (1759) was one of this family connection. So likewise were the Bonds. No name more honored than theirs in the medical annals of Pennsylvania. Dr. Charles E. Cadwalader's great, great grandfather, Dr. Phineas Bond, and his brother, Dr. Thomas Bond, were closely associated with Dr. Thomas Cadwalader in the important professional and public movements of their day. Dr. Thomas Bond, Jr., was a distinguished surgeon and the medical purveyor of the continental army in the revolution, appointed by Congress in 1781. The subject of this sketch graduated from the academic department of the University of Pennsylvania in 1858, and from the medical department in 1861. The civil war breaking out at the time of his graduation, he entered the military service, the first two years in connection with the cavalry and subsequently at the headquarters of the army of the Potomac, under Generals Hooper and Meade, having the brevet rank of lieutenant-colonel. After the close of the war, he was appointed to the charge of the department in bankruptcy of the United States district court, serving in that capacity for eight years. He then assumed the practice of medicine and has been continuously engaged in his professional pursuits ever since. He has been connected with numerous hospitals and homes and for a long time was connected with the Philadelphia Dispensary. He has taken an active interest in reform politics; although democratic in principles he believes in furthering the interests of the cleanest and best men irrespective of their party affiliations. He was one of the framers and most ardent supporters of the new city charter and also a member of the committee to organize the Pan-American congress. He is also identified with a number of the medical societies, more particularly the Philadelphia County Society, the American Medical Association, and is also a Fellow of the College of Physicians as well as a member of the Mutual Aid Association, the American Academy of Medicine, and is surgeon of the Meade Post G. A. R. He is a member of the Loyal Legion, the Sons of the Cincinnati and Sons of the Revolution.

CADWALADER, Thomas, of Philadelphia, Pa., was born in that city in 1707, and died near Trenton, N. J., November 14, 1779. His immediate ancestry were the most noted pioneers of our profession. There is no name in medical annals more closely connected with the social, political and medical history of Philadelphia—that time honored American center of medical learning, than that of the subject of this sketch. Claypole writes that, in 1682 seven vessels sailed for America—two

from London, two from Bristol, and three from Wales. Dr. Edward Jones, having charge of the Welsh colony, arrived in the Schuylkill in August, and Wm. Penn followed two months later. This Dr. Jones was the father-in-law of John Cadwalader (1697), who was a judge of the court, member of the assembly and a member of council. John Cadwalader's son, Dr. Thomas Cadwalader, began the study of medicine in Philadelphia, and was the first physician in that city to go abroad to complete his medical education; and on his return, in 1730, delivered medical lectures, with demonstrations on the cadaver, the first course of medical instruction and dissection known in America. In the same year he was one of the first physicians who introduced the practice of inoculating in Philadelphia, and was one of the founders and trustees (1731) of the Philadelphia Library and of the first medical library (1763). He was the author of the first medical work published in Pennsylvania (1745); he made the first autopsy (1742)—the only other instance on record in America being that on the body of Governor Slaughter, of New York, in 1691. He was the first to apply the treatment of electricity, in 1750, in a paralytic seizure of Governor Belcher, of New Jersey. At the foundation of the American Philosophical Society, in 1769, he was elected the first vice-president, and virtually its presiding officer, for Franklin, who was elected president, was in Europe. He was director of military hospitals in the revolution, one of the founders of the Pennsylvania Hospital (1751), and served as one of the original physicians until 1779, and was also one of the original trustees of the Medical College of Philadelphia at its foundation, in 1765, and was one of the first clinical lecturers. This was the first medical school established in America, which is now the world-renowned University of Pennsylvania. Dr. Thomas Cadwalader was identified with all the movements of the day. During the French war he was honored with the appointment as a member of the Governors' council to take action on Braddock's defeat. He remained a member of the provincial council from 1755 to 1774. During the French war he was also chairman of the "Provincial Commissioners," or Board of War, and a member of many other important commissions and public trusts, judge of the courts and mayor in the city council. He was chairman of the great tax meeting in 1773, the immediate precursor of the revolutionary movements in which his two sons, seven nephews, three sons-in-law and himself all took a principal part, both in the civil and military affairs. Col. Lambert Cadwalader and Gen. John Cadwalader were his sons. The latter's son Thomas was the General Cadwalader of the war of 1812. In July, 1776, the committee of safety of Pennsylvania appointed Dr. Cadwalader on a committee for the examination of all candidates that applied for the post of surgeon in the navy, and at the same time he was appointed as stated a medical director of the army hospitals. In 1778 he succeeded the elder William Shippen as surgeon of the Pennsylvania Hospital. Dr. Thacher in his "American Medical Biography and Memoirs of Eminent Physicians who have Flourished in America" (published in Boston in 1828), referring to Dr. Thomas Cadwalader says: "As a physician he was uncom-

monly attentive and humane, and as a man he was as remarkable for the tenderness and benevolence of his disposition. Constantly blest with a serene mind, it was as rare to see him too much cast down by bad, as unusually elated by good fortune. So distinguished a trait was this cheerful disposition in his character that it was once the means of saving his life on an occasion so extraordinary as to deserve mention. A provincial officer, named Brulman, during the war against the French in Canada, was for some misconduct cashiered, he thought unjustly, and the circumstance so preyed upon his mind that he became insane, and resolved to deprive himself of an existence that was no longer a pleasure, but a burden. In this desperate frame of mind he walked out early one morning with his fuzee determined to shoot the first person he should meet. He had not gone far before he met a pretty girl, whose beauty disarmed him. He next met Dr. Cadwalader; the doctor bowed politely to the officer, who though unknown to him had the appearance of a gentleman and accosted him with "Good morning sir, what sport?" The officer answered the doctor civilly, and as he afterwards declared, was so struck by his pleasing manner and address that he had no resolution to execute his desperate intentions. Impelled, however, by the same gloomy disposition that actuated him when he set out, he repaired to an adjoining tavern and shot the next man he encountered, and thereby obtained his wished for end, being afterwards hung in sight of the very house where he committed the premeditated act, and the finger that pulled the trigger was cut off, put into spirits and presented to a museum as a memento of the importance of true politeness. One who enjoyed his personal acquaintance says: "Dr. Cadwalader was a ripe scholar, an exact logician, a sound philosopher, and a perfect gentleman. That in filling various positions, both political and professional, and in discharging the duties appertaining thereto, his integrity and zeal were as conspicuous as his ability. But pre-eminent over his intellectual acumen and his boldness and honesty of purpose shone his character as a christian and philanthropist. That it was rare to find so much ability combined with so much simplicity; his religion was entirely free from fanaticism or ostentation; and that his politeness arose from pure benevolence of heart, and was therefore not an occasional manifestation, but an habitual characteristic." The doctor was unquestionably a man of remarkable coolness, self-possession and bravery, traits of character largely possessed by his descendants. Dr. Thatcher, the biographer previously quoted, referring to Dr. Cadwalader's treatise on the "Iliac Passion, or Colica Pictorum" says: "The author opposed with talent and learning the then common mode of treating that disease in which he exploded the practice of giving "Quick Silver" and drastic purgatives. He recommended in their place mild cathartics and the use of opiates. Dr. Rush in his lectures cordially endorsed the practice of Dr. Cadwalader and in some British journals this method of treatment was regarded as the most successful plan of any hitherto employed. This essay was written in 1745, and was one of the earliest publications on a medical subject in America. He is said, however, to have written a paper on "Inoculation in

Variola" (1730) which antedates this and all other contributions to American medical literature. Another early contribution of this author on the "West India Dry Gripes" attracted much attention. This was printed by Benjamin Franklin in 1745, and in it is appended an interesting history of a case of *Mollities Ostitum* in an adult, with post-mortem appearances.

CALDWELL, John Jabez, of Baltimore, Md. (name anciently Colville), of French-English descent, son of John S. and Rebecca B. Caldwell—the former a grandson of Captain Jonathan Caldwell, who raised and commanded during the revolutionary war the company known as the "Blue Hen's Chickens;" the latter a lineal descendant of William Penn—was born at Oak Hill, New Castle county, Del., April 28, 1836. His professional education was received in the New York Medical College, and in Bellevue Hospital, his degree of M. D. being conferred by the former institution in 1860. Until 1862 he practiced in New York; from 1866 to 1873 at Brooklyn, and since January, 1873, he has been established in Baltimore. While engaged in a general practice, he has given especial attention to the treatment of the nervous system. He is a member of the Kings County (New York) Medical Society; of the New York Therapeutic Society; of the Medical and Chirurgical Faculty of Maryland; of the Medical and Chirurgical Society of Baltimore; honorary member of the Maryland and District of Columbia Dental Society; life member of the Long Island Historical Society; and permanent member of the American Medical Association. In 1867-68, he was surgeon in charge of the Brooklyn central dispensary, and was one of the medical officers of the Brooklyn board of health during the cholera epidemic of 1866-67. Of his professional publications may be mentioned: "Carbolic Acid as an Embalmer," 1867; "Electrolysis of Tumors and other Cell Tissues," 1872; "Cauterization and Nitro-Muriatic Acid as a Prevention of Rabies," "Treatment of the Air Passages by Medicated Spray—with Cases," "Bright's Disease of the Kidneys—with Cases," "Comparative Pathology of Cholera, Yellow Fever and Malignant Malarial Fever," "The Spectrum Microscope in the Parasitic World," 1873; "Remarks on Hydrophobia," "Pathology of Club-foot," "Electricity as a Restorative Agent in Narcosis and Asphyxia," "History of Electro-Therapeutics, with Experiments," 1874; "The Introduction of Damiana," "Potency and Impotency, with Cases, Remarks and References," 1875; "Palsy Agitans Successfully Treated," "Cases Infantile Paralysis," "A New and Successful Treatment of Pertussis," Transactions of American Medical Association, 1876. From 1862 to 1866, he served as an acting assistant surgeon in the United States army, being employed in hospital and in the field. Dr. Caldwell is examiner for the Equitable Life Assurance Society of the United States.

CALDWELL, William Coleman, of Chicago, Ill., was born in Jefferson county, Miss., March 1, 1855. He is of Scotch descent, his ancestry having settled in this country about 1780. He was educated at the University of Louisiana. After studying medicine he attended the College of Physicians and Surgeons, Chicago, Ill., from which institution he

received his medical degree in 1885. After graduating he served as interne eighteen months in Cook County Hospital and has been a resident of Chicago for the past eight years. Dr. Caldwell has devoted considerable time studying the physiological action of drugs on animals, and has been Professor of Materia Medica and Pharmacology in the College of Physicians and Surgeons, Chicago, since 1887. His practice is limited to gynecology.

CAMPBELL, Henry Fraser, of Augusta, Ga., was born in Savannah, February 10, 1824, and died December 15, 1891. He was the son of James C. Campbell and was of Irish-American lineage. His mother, Mary R. (Eve) Campbell, a lady of fine intellectual endowments and high culture, was the only daughter of Joseph Eve, a name once familiar as connected with the early history of the cotton gin. This gentleman was the father of Professor Joseph A. Eve, of Augusta, and of Dr. Edward A. Eve, and the uncle of the late Professor Paul F. Eve, of Nashville, Tenn., who were the preceptors and trainers in medicine and surgery of the subject of this sketch in the earlier periods of his life. His education and moral culture, with that of his only brother, were carefully superintended by his mother, aided by his uncle Dr. Robert Campbell. Having received an academic education supplemented by a classical course under a private tutor, he entered the Medical College of Georgia, now the medical department of the University of Georgia, and was graduated M. D. in March, 1842. In the same year he established himself in Augusta, where he continued to reside for a period of about fifty years, excepting the time he served in the Confederate army. He married June 17, 1844, Sarah Bosworth Sibley. In 1861 he was commissioned a surgeon in the Confederate States army; was assigned as medical director of the Georgia Military Hospital, at Richmond, Va., and in this capacity—being at the same time a member of the army Board of Medical Examiners—served until the end of the war. He made specialties of surgery and gynecology. Of his notable cases may be mentioned: forty-four of lithotomy, forty-two successful; and fifteen of gangrenous inflammation, arrested by ligation of the main artery, the date of the first ligation being June 5, 1862. The *sliding-hook forceps*, for vesico-vaginal fistula, and the *pneumatic repositor* for self-replacement of the uterus, are instruments of his invention. From 1842 to 1854 he was demonstrator and assistant demonstrator; from 1854 to 1857 he was professor of comparative and microscopical anatomy; from 1857 to 1866 he was Professor of Anatomy in the medical department of the University of Georgia. In 1868 he became professor of operative surgery and gynecology in this institution and served in this capacity for many years. During this period he was clinical lecturer in Jackson Street Hospital, the City Hospital and the Freedman's Hospital, of Augusta. After the rebellion he was called to New Orleans, where in the year 1866, he filled the chair of anatomy, and in 1867 that of surgery in the New Orleans School of Medicine and was also clinical lecturer in the Charity Hospital of that city. By his studies, lectures and contributions to medical literature he has made his labors of great benefit to his profession and to mankind. The following may be named as among his more

important professional publications: "Abortive Treatment of Gonorrhœa by Nitrate of Silver;" "Abuse of Diuretics;" "Observations on Cutaneous Diseases" (1845); "Infantile Paroxysmal Convulsions, their Identity with Intermittent Fever, and their Treatment with Quinine;" "Dentition in Producing Disease (Reflex-Secretory or 'Vaso-Motor' Action); "Epidemic Dengue Fever;" "Law Governing the Distribution of Striped and Unstriped Muscular Fibre;" "Injuries to the Cranium in their Relations to Consciousness;" "Bilateral Lithotomy;" "Unusual Form of Fever and Dysentery" (1851); "Report on Surgery," Transactions Medical Association of Georgia, 1852, "The Nature of Typhoidal Fevers," Transactions of the American Medical Association; "The Sympathetic Nerve in Reflex Phenomena, a Question of Priority of An-

Henry F. Campbell

nouncement with M. Claude Bernard," 1853; "Strangulated Ventral Hernia During Pregnancy;" "Clinical Lecture on Traumatic Tetanus;" "The Excito-Secretory System of Nerves," prize essay, Transactions American Medical Association 1857; "Meckel's Ganglion;" "Classification of Febrile Diseases by the Nervous System," Transactions American Medical Association 1857; "The Nervous System in Febrile Diseases, Excito-Secretory or Reflex 'Vaso-Motor' Action the Basis of their Phenomena;" "The Secretory and the Excito-Secretory System;" "Caffeine as an Antidote to Opium;" "A New 'Ready Method' for Artificial Respiration in the Sitting Posture;" "Croup, a Paroxysmal Neurosis, its Treatment with Quinine;" "Caffeine in Opium-Coma (second case), Injection by the Rectum;" "The Effect of Caffeine upon the Muscular System," 1860; "The Georgia Military Hospitals of Richmond," pamphlet, Augusta Ga.,

1861; "Traumatic Hemorrhage and the Arteries," a chapter in the "Confederate Manual of Military Surgery," 1863 (the principle of ligating the main arterial trunk of a limb, for the cure of inflammation, and for gangrene, is announced in this chapter); "The Hunterian Ligation of Arteries in Destructive Inflammation," 1866; "Cooper's Surgical Dictionary," London, 1872 (article "Inflammation"); "Position, Pneumatic Pressure, and Mechanical Appliance in Uterine Displacements," a pamphlet; "Registration and Sanitation," first report of board of health of Georgia, 1875; "Blood-letting in Puerperal Eclampsia;" "Railroad Transportation of Disease-Germs," (Yellow and Dengue Fever in the South, in 1839, 1850, 1854, and 1876), annual report, board of health of Georgia; "Pneumatic Self-Replacement in Dislocations of the Gravid and Non-Gravid Uterus," American Gynecological Transactions; "Calculi in the Bladder after the Cure of Vesico-Vaginal Fistula;" "The Neuro-Dynamic Etiology and Pathology of Urinary Calculus," and "Arterial Ligation in the Treatment of Traumatic Inflammation and Gangrene," read before the surgical section of the International Medical Congress in 1876. In this list should be included his discussion with Dr. Marshal Hall, of London, touching "Priority of Announcement in Reflex Secretion and the Excito-Secretory System of Nerves," a digest and review of which will be found in the *Southern Medical and Surgical Journal*, 1857, in the *London Lancet*, May 2, 1857, in the *American Journal of Medical Sciences*, vols. for 1857 and 1858, and in the *Nashville Journal of Medicine and Surgery*, 1858. Dr. Marshall Hall's adjudication candidly awarded the claim of priority to Dr. Campbell, as will be found in the *London Lancet*, May 2, 1857. From 1857 to 1861, in conjunction with his brother, Dr. Robert Campbell, he was editor of the *Southern Medical and Surgical Journal*, published at Augusta, Ga. Few medical writers in this country worked in so wide a field, or presented themselves with a personality recognizable in so many distinct departments, and he soon became familiar to the medical world, receiving honors from associations in Europe and the United States, having been elected president of the American Medical Association in 1885, and was the second Southern man to hold the position. He had also been elected vice-president of this organization as early as 1858, and in the same year was elected a correspondent of the Academy of Natural Sciences of Philadelphia. In 1860 he was elected corresponding member of the Imperial Academy of Medicine of St. Petersburg, Russia; president of the Georgia Medical Association in 1871; a member of the Georgia State Board of health in 1875; a Fellow and one of the founders of the American Gynecological Society in 1876, and president of the Augusta Library and Medical Society in 1877.

CAMPBELL, William Armstead, of Colorado Springs, Col., was born near Eaton, Preble county, Ohio, December 1, 1856. He is of Scotch descent, his ancestors having emigrated from Scotland the fourth generation back, and settled in Delaware. The doctor's father removed with his parents to Ohio, in 1826, when he was but a child, and settled on the farm which was then an unbroken wilderness, where the doctor was born. William

was the fourth child of a family of six children. He spent his boyhood days on the farm to which he accords his physical development. His literary education was gained in the common schools and the Eaton Union High School, from the latter he graduated with honors, in 1875. The following three years were spent in teaching in the public schools and reading in the office of his preceptor, W. M. Campbell, M. D. He graduated from the Ohio Medical College, at Cincinnati, Ohio, March 2, 1880, standing in the front ranks of his class of one hundred and two. He was married on the 22d of April, 1880, to Minnie A. Surface, and at once entered into the practice of medicine and surgery at Eaton, Ohio. He remained in practice here for ten years, and established himself in the confidence of the people to a marked degree. Owing to the failure of his wife's health, he found it necessary

W. A. Campbell

to abandon this field of work and seek a new one in a more congenial clime. He came to Colorado Springs in May, 1890. Before coming, he attended a course of abdominal surgery in the Chicago Polyclinic. Upon coming to Colorado Springs, he at once entered into general practice, and has gained for himself a firm foothold in this western city. He served as chief surgeon of Colorado Midland railroad for several months since coming to Colorado. He has always taken an active part in medical society work, having served as president of his county society in Ohio, as the first president of the Southwestern Ohio Medical Society, and since coming to Colorado, as secretary of the El Paso County Medical Society, and is now also president of the latter. He never fails to do his part in the literary work of the society, and articles from his pen are frequently found in our best medical publica-

tions. Being thoroughly devoted to his life-work, he finds but little time to devote to work that does not pertain to his profession.

CARNOCHAN, John Murray, of New York, was born in Savannah, Ga., July 4, 1817, and died in the former city, October 28, 1887. He was educated in the High School and the University of Edinburgh, and after taking his degrees in the latter institution returned to the United States, and at the age of seventeen began the study of medicine and surgery, in the office of the late Dr. Valentine Mott, in New York city. In 1841 he went to Paris, entered the Ecole de Medicine, and for six years worked in the hospitals and attended clinical lectures. He then returned to New York and began to practice as a surgeon. In 1850 he was placed in charge of the newly-established hospital for immigrants, on Ward's Island, and gave it a thorough organization. The same year he was appointed Professor of Surgery in the Medical College of the University of New York. He was also health officer of the port of New York, for two years, under the administration of Governor Hoffman. He has made numerous contributions to the literature of general and operative surgery, based upon his own practical experience, which are recognized as standard authority throughout the world.

CARPENTER, Henry, of Lancaster, Pa., was born in that city December 10, 1819, and died there, July 9, 1887. Since his ancestors settled in this country, five generations of the family have passed, each of which has produced one eminent physician. He was of Swiss descent and the son of Henry Carpenter, formerly a surveyor and conveyancer, and at one time a member of the board of commissioners of Lancaster county. He was educated in the public schools of Lancaster and the Lancaster County Academy, and, after reading medicine with Dr. Samuel Humes, entered the medical department of the University of Pennsylvania, from which he graduated in 1841, commencing the practice at once in Lancaster, his office being set up in the building in which he was born and lived. He was a member of the Lancaster County Medical Society, which he aided in organizing in 1844, and of which he was secretary for many years from the date of its organization, and president in 1855; and of the Pennsylvania State Medical Society, of which he has been secretary and vice-president, and was one of the censors. He was long a member of the city council of Lancaster, serving continuously for twenty years as president of the select branch, and for some time as president of the lower branch; and has also been a member of the Lancaster school board. During the civil war he was twice called by the surgeon-general of the State into the service of the volunteer surgical department. He was formerly one of the directors of the Conestoga Steam Mills Company; was one of the originators of the Conestoga Turnpike Company, as well as its president; and was a director of the Lancaster and Quarryville narrow gauge railroad; director and treasurer of the Delaware River and Lancaster railroad, and director and treasurer of the National railroad. Among his best known patients were President Buchanan, and the Hon. Thaddeus Stevens, both of whom he attended for many years. He rendered valuable services during the civil war, being at various periods surgeon in charge of the Eck-

ington Hospital at Washington, and of the State Hospital at Hagerstown.

CARR, Ezra S., of Pasadena, Cal., was born in Stephentown, Rensselaer county, N. Y., March 19, 1819. He comes from families who were original settlers in Rhode Island and Massachusetts, his father's family being from the latter State, and his mother's, the Goodrichs, from the latter. He is a graduate of the Rensselaer Polytechnic schools, and of the Albany, New York, and Castleton, Vermont Medical Colleges, 1842. A member of the American Medical Association, he was its vice-president in 1848; and he has also been a member of the American Association for the Advancement of Science since its foundation. He is the author of many scientific and medical papers, among others on the "Genesis of Crime," "Diseased Moral Conditions," on "Medical Education," and a work entitled "Patrons of Husbandry on the Pacific Coast." In 1842 he was appointed Professor of Chemistry in the Castleton Medical College, a position he held twelve years; from 1846 to 1850 he was Professor of Chemistry in the Philadelphia College of Medicine; and from 1851 till 1856 in the Albany Medical College; holding also a professorship in the University of Albany; was chemist of New York State Agricultural Society. In the same year he became Professor of Chemistry and Natural History in the University of Wisconsin, at Madison, of which he was also one of the regents, and was also one of the commissioners appointed to make a geological survey of the State. This professorship he held till 1869. From 1861 to 1865 he was Professor of Chemistry in Rush Medical College, retaining his position also in Madison; and was president of Wisconsin State Medical Society for several years. In 1869 he was appointed Professor of Agricultural Chemistry and Agriculture in the University of California, an office he held six years, and was at the same time Professor of Chemistry in Toland Medical College, San Francisco. He has also been superintendent of public instruction for the State of California.

CARSTENS, J. Henry, of Detroit, Mich., was born June 9, 1848, in the city of Kiel, in the German province of Schleswig-Holstein. His father, John Henry Carstens, a merchant tailor, was an ardent revolutionist, and participated in the various revolts in the memorable years of 1848-49. He had been captured and was imprisoned when his son was born; some months after he was released, and began attending to his business, but fearing that he might be again imprisoned, he packed up a few goods, and with his family left in the dead of night for America, and on his arrival settled in Detroit, where he has since remained. One of his grandfathers was an architect and builder, another a shipbuilder; many of his uncles, with other relatives, were officers in the army and navy, and nearly all of them participated in the revolution, and were forced to leave Germany and come to the United States. Dr. J. H. Carstens is the eldest of two children. His earlier education was received in the public schools of Detroit, supplemented by six years' attendance at the German-American Seminary. While receiving instruction at the latter institution, his parents lived on a farm four and a half miles from the city, which distance he was compelled to walk twice a day. He evinced, even as a boy, an eager

desire for intellectual work, excelled as a student and took high rank in his studies, especially those pertaining to natural sciences and mathematics. Before he had attained his fifteenth year, he was compelled to engage in business, and after some time devoted to lithography, he entered the drug store of William Thum, and afterwards served in Duffield's drug store, and with B. E. Sickler. He became proficient in the various details of the business, served one year as prescription clerk in Stearns' drug store, and then began the study of medicine, his name being the first on the matriculation book of Detroit Medical College. Even before graduation he had charge of the college dispensary, and after his graduation, in 1870, he was immediately put in charge of the dispensary, and a few years later he held the same position in St. Mary's Hospital Infirmary. He was appointed lecturer on Minor Surgery in the Detroit

Henry Carstens

Medical College, in 1871, and afterwards lecturer on Diseases of the Skin, and Clinical Medicine. He has lectured on almost every branch of medical science, the most important subjects so treated being Diseases of Women and Children, Differential Diagnosis, Nervous Diseases, Physical Diagnosis, Pathology, Chemistry, Materia Medica and Therapeutics. His taste and practice gradually tended to the diseases of women, and after holding a Professorship of Materia Medica and Therapeutics in the Detroit Medical College for some years, in 1881 he accepted the professorship of obstetrics and clinical gynecology, a position he has ever since held, and on the consolidation of the Michigan College of Medicine he was appointed to the same position in the Detroit College of Medicine. As a lecturer on medical subjects he has performed most satisfactory labors, is

thorough in his investigations and in the application of knowledge gained by practical experience and unremitting research. He is terse, clear, and practical and easily wins the respect of those who come under his teaching. In view of the experiences of his father, it is but natural that Dr. Carstens should have a strong taste for politics. Ever since he has been old enough to understand the political situation in this country he has been a staunch republican. Before his twentieth year he delivered political speeches, and this he continued for many years, speaking in either English or German in many parts of the State of Michigan. In 1876 he was elected chairman of the republican city committee, and at the same time was a member of the county committee. During the year he held these positions, he materially assisted in securing republican control of the city and county. Both as an organizer and as an earnest effective worker, he has rendered valuable aid in gaining victories for his party, and has been often tendered party nominations. He has, however, thus far refused to become a candidate for office, with the exception of a nomination as member of the board of education, to which he was elected in 1875 and re-elected in 1879. In 1877 he was elected president of the board of health, and during his term of office rendered valuable assistance in checking the spread of small-pox, which was then prevalent. On the organization of the Michigan Republican Club, he was elected a director. In 1892 he was selected by the State convention as presidential elector for the first district of Michigan, and ran about three hundred ahead of the ticket. His rapidly increasing professional duties, of late years, have prevented active political work, and with the exception of an occasional speech, his whole time has been devoted to his profession. His contributions to medical literature have been various and extended. He has reported many clinical lectures and has translated various articles from German and French medical journals. Among the more important of the articles written by him may be named: "Cleft-palate and Iodoform," "Medical Education," "Embolism," "Vaccination," "Household Remedies," "Phantasia," "Clinical Lectures," "A Case of Obstetrics," "Dysentery Cured without Opium," "Strangulated Hernia," "Hemorrhoids," "Clinical Lectures on Gynecology," "A Case of Epilepsy Caused by Uterine Stenosis," "Three Cases of Battey's Operation," "Uterine Cancer," "Menorrhagia and Metrorrhagia," "Cancer," "Ergot in Labor," "Mechanical Therapeutics of Amenorrhœa," "A Different Method of Treating a Case of Freshly Ruptured Perinaum," "Fibroid Tumor Removed by Laparotomy," "Vesico-Vaginal Fistula," "Leowenthal Theory of Menstruation," "Mastitis," "Laceration of the Cervix Uteri," "A Small Book on Amenorrhœa," "Dysmenorrhœa and Menorrhagia." Nearly all of his articles have been extensively copied by medical journals in this country, and some by European journals. He holds the position of gynecologist to Harper Hospital, attending physician at the Woman's Hospital and obstetrician of the House of Providence. He is a member of the Michigan Medical Association, and of the Michigan State Medical Society, of which he was vice-president in 1885;

president of the Detroit Medical and Library Society; a member of the Detroit Academy of Medicine, and of the British Gynecological Society; honorary member of the Owosso and Kalamazoo Academy of Medicine, and the Northwestern District Medical Society, and vice-president of the American Association of Obstetricians and Gynecologists. In 1891-92 he was president of the Detroit Gynecological Society. About this time he gave up general practice and now devotes himself exclusively to abdominal surgery and the diseases peculiar to women. He has extensively written on these questions the title of some of his articles being: "One Year's Work in Laparotomy," "On the Technique of Vaginal Hysterectomy," "Early Diagnosis of Uterine Cancer," "On the New Laparotomy," "On Some Cases of Extra Uterine Pregnancy," and "Successful Porro Cesarian Sections." His advance as a physician has been steady and sure; he has been a continuous student and a hard worker; his practice has grown into an extensive and remunerative one and he finds his time and hands fully occupied. He has given to certain diseases close and special attention and has worked out for them peculiar, independent and successful modes of treatment. Among his professional brethren he holds the place due to his talents and manly character, and is ever ready to aid any enterprise that may be originated for the good of the public. Although his professional duties are onerous, he finds time for general reading and keeps well informed in a wide range of intellectual culture; is thorough and earnest in all he undertakes, and has the undivided good will and respect of the community in which he dwells. He was married October 18, 1870, to Hattie Rohnert, who had for some time been a teacher in one of the public schools.

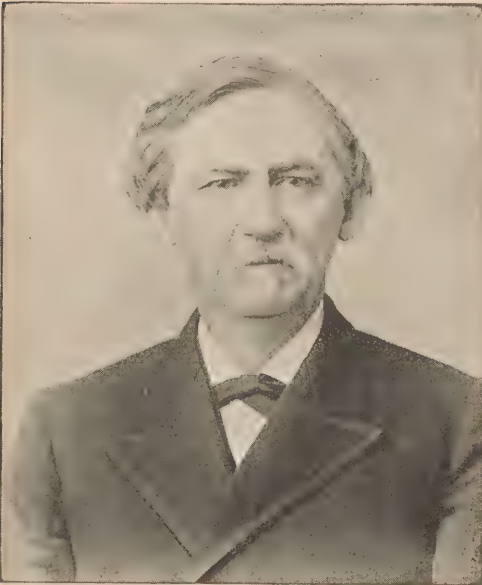

CATES, Abraham Barker, of Minneapolis, Minn., son of Dr. C. B. Cates, was born in East Vapalboro, Maine, May 12, 1854. He received his academic education at Colby University, Waterville, Maine, taking the degree of A. B. in 1874, and the degree of A. M. in 1877. For three years subsequent to graduation he was principal of the High School at Cherryfield, Maine. At the expiration of this time he entered the medical department of Harvard University, from which he graduated in 1880. The following year was spent abroad in post-graduate work, principally under the tutelage of Carl Braun, Welpner, Bandl, Rokitansky and Lott, at Vienna; Winckel, at Dresden; and Schroeder and Martin at Berlin. Immediately after his return from Europe he began practice in Minneapolis, where he has since resided. Coincident with the beginning of his practice were his lectures on Obstetrics, in the Minnesota College Hospital. The school then organized is now the Department of Medicine and Surgery of the University of Minnesota, in which he still lectures on the same subject. For several years he acted as secretary of the faculty. In 1883-84 he served as city physician of Minneapolis. On June 19, 1889, he was married to Abby Wilder Jewett, daughter of Samuel A. Jewett, of Jewett Mills, Wisconsin. He is a member of several medical societies, an ex-president of the Society of Physicians and Surgeons and Obstetrician to the Asbury Methodist Hospital.

CATHELL, D. Webster, of Baltimore, Md.,

was born November 29, 1839, in Worcester county, Md., his ancestors being among the earliest English and Scotch settlers of Maryland. He received his professional education at the Maryland University and Long Island College, receiving the degree of M. D., June 29, 1865. He commenced practicing in Baltimore immediately after his graduation, and has ever since remained in that city. He is a member of the Maryland State Faculty, and several other medical societies. He has been identified with the Baltimore Medical Association, and the Medical and Surgical Society of Baltimore since their origin, and in 1872 was president of the last-named society. Among his many contributions to medical literature, the following are the most note-worthy: An essay on "Eczema in the Pudendal Region;" "Use of Belladonna in Scarlatina Anginosa;" essays on "Medical Ethics;" and an exceedingly popular work, entitled, "The Physician Himself," of which many editions have been issued. He was surgeon of the 8th Regiment Maryland National Guards, examining surgeon of the militia, and United States examiner of pensioners. In 1872 he was elected Professor of Pathology in the College of Physicians and Surgeons, of Baltimore.

CHAILLÉ, Stanford Emerson, of New Orleans, La., was born in Natchez, Miss., July 9, 1830, and is of French descent. As early as 1396 and for many years thereafter, the Chaillé family gave to Poitiers, France, many mayors and other officials. Catholic descendants of the family still live near La Rochelle, the seaport nearest to Poitiers. Certainly as early as 1650 one branch became Huguenots or Protestants. According to family tradition, about 1685, when the "Irrevocable Edict of Nantes" was repealed and Catholic persecution reached its horrible culmination, Pierre Chaillé, a Huguenot, having witnessed the massacre of his family, succeeded, when a youth, in escaping to an English vessel at La Rochelle, and took refuge for years in England. He married a Miss Margaret Brown, said to have been a Huguenot and therefore was probably named Marguerite Le Brun. About 1700 he is believed to have settled in Boston, Mass. His son Moses, who lived some years in Boston, emigrated to the eastern shore of Maryland in 1710, became wealthy, and died there in 1763. He married Miss Mary Allen, a sister of Judge Allen, and a sister also of the wife of the Rev. Jno. Rosse, the first pastor of the Episcopal church, built in 1734 at Snowhill, Md. Col. Peter Chaillé, the only son of Moses and Mary Chaillé, was a distinguished patriot in the revolutionary war, a member of the Maryland convention of 1775, a subscriber to funds for carrying on the war, a delegate to sign and ratify the United States constitution, and a member for more than twenty years of the Maryland legislature. He married Miss Comfort Houston (whose father was a Scotch gentleman and her mother a Miss Quinton), and they left four sons and four daughters who bore descendants. Wm. Chaillé, a younger son of Col. Peter Chaillé, was born in 1767, and died in 1800, married Anne Handy, who was born in 1775 and died in 1814. Anne Handy was the daughter of Col. Eben Handy, a patriot of the war for independence; he was a great grandson of the Samuel Handy, who, landing in America in 1675, became the Amer-

ican progenitor of very numerous Handys now living in the United States. The only children of Wm. Chaillé and Anne Handy were Peter Chaillé, who died young and unmarried, and Wm. Hamilton Chaillé, the father of Dr. Chaillé. Wm. Hamilton Chaillé was born in Salisbury, Md., March 1, 1799, emigrated to Natchez, Miss., in 1819, and there died, August 13, 1836, prosperous, loved and honored. October 23, 1828, he married at Vienna, Md., Mary Eunice Priscilla Stanford, born in Maryland, November 19, 1804, and died in Natchez, April 22, 1844. She was the daughter of Dr. Clement Stanford and his wife Anne Dashiell, and a niece of Hon. Richard Stanford, a member of the United States Congress from North Carolina, 1797 to 1816. The Stanfords were of the English cavaliers, and the first Richard Stanford landed in Virginia, in 1635. Dr. Chaillé's direct descent is from the earliest settlers of the United States, and noted patriots in 1776;

Stanford E. Chaillé

among these ancestral families are those of Stanford, Handy, Dashiell, Houston, Quinton, Adams and Polk. Three of Dr. Chaillé's four great grandfathers, and many more of his relations were soldiers of 1776. Dr. Chaillé is the only child of Wm. H. Chaillé and his wife Mary Stanford. Both sides of his family for generations were stanch members of the Episcopal church. Dr. Chaillé married, February 23, 1857, Laura E. Mountfort, daughter of Lieutenant-colonel Jno. Mountfort, United States army, son of Joseph Mountfort, one of the famous Boston "Tea Party" of 1773. The Mountforts are a Boston family descended from Edmund Mountfort, who settled in Boston in 1656. Dr. Chaillé's only child is Mary Laura Chaillé, born November 16, 1857, wife of Dr. David Jamison, of New Orleans. They have two children, Stanford Chaillé Jamison, born 1887, and David Chaillé Jamison, born 1888. Dr. Chaillé was educated by private tutors until his mother's death in 1844. She

had appointed her husband's dearest friend and her son's godfather, Hubbard Emerson of Massachusetts, as her son's guardian. To him, who proved to be a faithful and beloved second father, the son was sent, and was in 1844 entered at Phillips Academy, South Andover, Mass., and was there graduated in 1847. He was at Harvard College 1847-1851. He is an A. B. of 1851, and an A. M. of 1854 of Harvard. He began the study of medicine (1851) and was graduated (1853) by the medical department of the University of Louisiana, now the Tulane University, Louisiana. In 1860-61 he was a student in Paris in the laboratory of Claude Bernard, then the world's most eminent physiologist. He renewed his studies in Paris in 1866-7. During the rebellion he served in the Confederate army, and held the following positions: Private Orleans light horse 1861-2; acting surgeon-general of Louisiana, February 17 to May 1, 1862; surgeon and medical inspector army of Tennessee, staff of Gen. Braxton Bragg, May 12, 1862, to July 24, 1863; surgeon in charge of Fair Ground No. 2 Hospital, Atlanta, Ga., 1863; surgeon in charge of the Ocmulgee Hospital, Macon, Ga., January, 1864, to May, 1865, when he was captured and paroled. He returned to New Orleans September, 1865. He was resident student of New Orleans Charity Hospital, 1852-3; resident physician United States Marine Hospital, 1853-4; resident physician Circus Street Infirmary, 1854-60; co-editor and proprietor of *New Orleans Medical and Surgical Journal*, 1857-68; demonstrator of anatomy in medical department University of Louisiana, 1858-67; lecturer on obstetrics, 1865-6; professor physiology and pathological anatomy, 1867 to present time; chosen to deliver one of the ten addresses (the one on Medical Jurisprudence), before the International Medical Congress, Philadelphia, 1876; appointed by the United States Congress one of the twelve experts to investigate the great yellow fever epidemic of 1878 and was chosen secretary of this board, 1878-9; appointed by the National Board of Health one of the four members of the Havana Yellow Fever Commission, was chosen and served as president thereof, 1879; appointed by the National Board of Health its "executive agent" at New Orleans, with the title of "Supervising Inspector of the National Board of Health, March, 1881, to October, 1882; commissioned by the President of the United States one of the seven civilian members of the National Board of Health, January, 1885, to the present time; delivered crowded popular lectures on physiology and hygiene to school teachers and the public for four years, 1884-8; chosen dean of medical department Tulane University, La., March 31, 1885, to the present time; appointed by Tulane University professor of physiology and hygiene in the collegiate department, 1886-8; chosen (1885) chairman of the section of hygiene of the International Medical Congress, held at Washington 1887, but could not accept this high honor; attended Ex-President Jefferson Davis, Dr. Chaillé's most honored friend, in adversity as in prosperity, in his last illness, November and December, 1889; appointed Professor of Physiology, Hygiene and Pathological Anatomy, medical department Tulane University, La., 1890, and was chosen the Louisiana member of the committee on the organization of the Pan-American Medical Congress, 1891-3. Contributions

to medical literature were begun by him in 1853 and have been numerous since. The most important are to be found, when not otherwise stated, in the *New Orleans Medical and Surgical Journal*, and are as follows: Eight articles on the Vital Statistics of New Orleans, 1868, 1870-2-4, 1880-3, and in connection with Voters 1874-6, published by United States Congress; "Origin and Progress of Medical Jurisprudence," Transactions International Medical Congress 1876-7; "Human Anatomy and Evolution," 1879, *New York Medical Record*; "Medical Colleges, Profession, and Public," 1874; "State Medicine and Medical Organization," Transactions Louisiana State Medical Society, 1879; "State Medicine and State Medical Societies," Transactions American Medical Association, 1879; "Sanitation and Evolution," Transactions American Public Health Association, Volume VI, 1881; "Abuse of Alcoholics," Transactions American Public Health Association, Volume XII, 1887; Appendix to Conclusions Board Yellow Fever Experts, United States Congress, 1879; Preliminary Report Havana Yellow Fever Commission in Volume II, 1880, of Annual Report National Board of Health, and in Volumes III, IV, other reports on Yellow Fever; "Prevention of Yellow Fever," 1882; "Small-pox and Vaccination," 1883, published by New Orleans Auxiliary Sanitary Association; "Importance of the Study of Hygiene in Schools," 1882; "School Books on Physiology and Hygiene," 1883; "Inundations and their Influence on Health," 1882, 1883; "Infants, Their Chronological Progress," 1887; numerous official reports, annual catalogues, and catalogues of alumni in behalf of the medical department Tulane University, La., 1885-1893. Chiefly to Dr. Chaillé, as chairman of Committee on State Medicine, in Louisiana State Medical Society, is due the clause in favor of State medicine in the Louisiana constitution of 1879, and also several laws enacted by Louisiana. He has been familiar with yellow fever epidemics since 1850, and studied it in New Orleans for many years when it prevailed annually. Dr. Chaillé is an honorary member of the College of Physicians, Philadelphia; of the Medical and Chirurgical Faculty of Maryland; of the Academy of Medical Sciences, Havana, Cuba, and of the Louisiana Pharmaceutical Association. He is a member of the American Medical Association; of the American Public Health Association, Louisiana State Medical Society; Orleans Parish Medical Society; Louisiana Educational Association; New Orleans Auxiliary Sanitary Association, etc. Among many compliments paid to Dr. Chaillé none have been more valued than the very many evidences of confidence, esteem and affection of the Hon. Jefferson Davis, before, during and after his presidency of the Confederate States. In 1880, the two foremost men in the American medical profession—Professor S. D. Gross, M. D., of Philadelphia, and Professor Nathan S. Davis, M. D., of Chicago—surpassed all other friends in laudatory letters to the President of the United States, commending Dr. Chaillé for appointment as a member of the national board of health. Once a week for eight months, during four years, Dr. Chaillé delivered popular lectures on physiology and hygiene, which were always overcrowded, and brought to him many other flattering evidences of public appreciation.

Prof. S. D. Gross, M. D., was President of the International Medical Congress, held in Philadelphia, in 1876, and publicly announced that he would rigidly limit every one of the ten addresses to the sixty minutes allotted to every speaker. Dr. Chaillé's address on Medical Jurisprudence exceeded sixty minutes, but when his allotted hour had expired he halted, and, turning to Professor Gross, said: "Mr. President, my hour has expired, and I await your orders." The president eagerly exclaimed, "Go on, sir; go on, we don't stop a race-horse when we get him on the track."

CHANCELLOR, Charles Williams, of Baltimore, Md., was born near Fredericksburg, Va., February 19, 1833. His father was Major Sanford Chancellor, a soldier of the war of 1812, and his paternal grandmother was a sister of Hon. John Edwards, one of the first two United States senators from Kentucky, and an

Ch. Chancellor

vunt of Governor, afterwards Senator, Winian Edwards, of Illinois. His classical education was acquired at Georgetown College, D. C. He studied medicine at the University of Virginia, and Jefferson Medical College, Philadelphia, graduating in 1853-54. Later in life he pursued his studies in France and Germany. He practiced first in Alexandria, Va.; but at the beginning of the civil war he entered the Confederate army, and was assigned to duty as medical director of General Pickett's Division. After the war he located in Memphis, Tenn., and was connected with the health department of that city during the terrible epidemics of cholera and yellow fever, in 1866 and 1867, respectively. In 1868 he was appointed professor of anatomy and subsequently professor of surgery in the Washington University (now College of Physicians and Surgeons), Baltimore. He was, for six years, a member of the Baltimore city council, and

two years president of the upper branch. He was president of the Board of Managers of the Maryland State Insane Asylum for a number of years, and devoted much time to the interests of the institution. In 1876, he was made secretary and executive officer of the Maryland State Board of Health, which he had been mainly instrumental in inducing the Legislature to establish as an essential department of the State government, and has continued in that position ever since. Besides numerous contributions to current medical and sanitary literature, he has written and published the following works: "The Charitable and Penal Institutions of Maryland;" "Sanitation of Cities and Towns;" "Improved Methods of Sewage Disposal;" "A Treatise on Mineral Waters and Sea-side Resorts," and "The Climate of the Eastern Shore of Maryland." Dr. Chancellor has been twice married. His first wife was the great granddaughter of Chief Justice John Marshall, of Virginia; his second marriage was with Miss Martha A. Butler, of Tennessee, a great granddaughter of Colonel Thomas Butler, of revolutionary fame, and a great niece of Mrs. Andrew Jackson, of "The Hermitage."

CHANCELLOR, Eustathius Anderson, of St. Louis, Mo., was born at Chancellorsville, Spottsylvania county, Va., on August 29, 1854. He is a son of Doctor James Edgar Chancellor and Dorothea J. (Anderson) Chancellor, and comes of English descent. He received a thorough classical education at the Charlottesville (Va.) Institute, Locust Dale Academy, where he achieved many honors for literary work, and the University of Virginia; in this latter institution, besides mastering ancient and modern languages, he pursued the studies of civil and mining engineering for eighteen months, when ill health supervened and he was required to permanently give up this avocation. In 1876 he graduated in the medical department of the University of Virginia, and one year later received a second diploma from the University of Maryland, School of Medicine. In the meantime he was appointed resident student and physician to the University Hospital of Baltimore and for two years thereafter remained in this institution, at the same time held the position of prosector to the chair of anatomy in the Maryland University. Many of the surgical clinics in this institution for years were reported by him in the *Maryland Medical Journal* and the *Virginia Medical Monthly*. Subsequently he attended clinics at the University of Pennsylvania. In 1879 he located at the University of Virginia and Charlottesville, being associated with his father in the practice of medicine and surgery up to the time of his departure for St. Louis in 1880. Scarcely had one year elapsed before he became a victim of typhoid fever and spinal meningitis which made him an invalid for more than six months. He rapidly accumulated a practice after convalescence and united with a number of secret orders. His ability and studious habits recommending him, he became medical examiner of some twenty or more of these societies. He contributed many valuable papers to the medical press, some of which may be mentioned: "The Treatment of Delirium Tremens," 1881; "Successful Operation for Deformity of the Wrist," 1881; "Gonorrheal Articular Rheumatism," 1883; "Treatment of Diabetes In-

sidipus," 1883; "Syphilis in Men," 1884, and "Causes of Sexual Depravity—A Remedy," 1885. He was elected supreme medical director of the Legion of Honor in 1886, but declined to be re-elected in 1889, having filled the position efficiently and satisfactorily for three consecutive years. As a ready medical writer, a fluent and lucid lecturer, his reputation is well established, being an energetic worker in several local as well as many State medical societies. He was one of the founders of the Beaumont Hospital Medical College, in 1885, and filled the chair of dermatology and syphilology until 1890, when he resigned by reason of his growing popularity and increased practice. No one has done more than he to advance the high standard of life insurance examinations, and characterize this field as a distinct specialty. He has the good

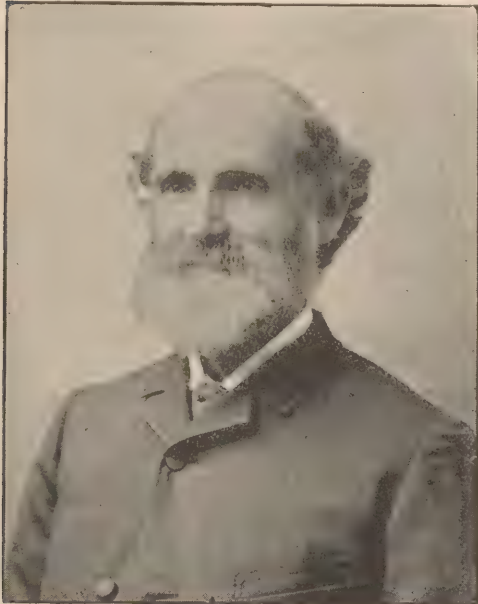

Eustathius Chancellor,

fortune to be medical examiner of many of the best life insurance and accident companies in the land, and represents several traveling men's mutual associations. In 1884 he was made corresponding secretary of St. Louis Medical Society; also became a member of the American Medical Association, and a member of the Tri-State Medical Society. In the same year he graduated with a degree of Master of Arts, from St. Louis University. In 1888 he was commissioned State Medical Examiner of the Royal Arcanum, for Missouri. In 1891, he was appointed by the Governor of Missouri the Medical Director of the National Guard of Missouri. In 1891 he was elected Second Vice-President of the Association of Military Surgeons of the National Guard of the United States and in the following year, at the annual meeting in St. Louis, was made its secretary. In 1889, he wrote several descriptive articles for the daily press, on "Travels Through the Pacific

Slope and the Northwest," which were extensively published and widely circulated.

CHANCELLOR, James Edgar, of Charlottesville, Virginia, was born at Chancellorsville, Spottsylvania county, that State, January 26, 1826. He is the youngest son of George and Ann Chancellor and is of English descent. He was educated at Fredericksburg Classical Academy, and had as his preceptor in medicine Dr. G. F. Carmichael, of Fredericksburg, Va. He matriculated as a student of medicine in the University of Virginia, at the session of 1846-47, and obtained his M. D. degree at the Jefferson Medical College, Philadelphia, in the spring of 1848. Located in the gold mining district of his native county, near Chancellorsville. In 1853 he married Miss Josephine Anderson, of Spottsylvania county, and subsequently removed to Court House, the county seat, where he enjoyed a large practice up to the outbreak

J. Edgar Chancellor.

of the war between the States. In 1861 he was commissioned assistant surgeon of Confederate States army, and assigned to duty at the General Hospital, Confederate States army, Charlottesville, Va. In the spring of 1862, he was joined by his family, at the University of Virginia. In July following his wife died, leaving four sons and a daughter. He married Mrs. Gabriella Mays, of Albemarle county, November 2, 1867. In 1862 he was promoted to full surgeon, and continued on duty at General Hospital Confederate States army, at Charlottesville, which had a capacity of five hundred to six hundred beds. In the spring of 1864 he was appointed a member of the reserved surgical corps, and ordered to the battle-field of the Wilderness and Spottsylvania Court-house, and around Richmond. Returned to General Hospital, Charlottesville; was ordered to take charge of hospital at Drury's Bluff, and subsequently to Har-

risonburg, but owing to the peculiar circumstances that environed him, and by request of Surgeon J. L. Cabell (surgeon in charge), he was continued on duty at General Hospital, Charlottesville. The movement of General Sheridan, in the spring of 1865, cutting off communication with the army of Northern Virginia, closed the General Hospital at Charlottesville. With an ambulance, a wounded soldier, and some medical stores, he set out to join General J. E. Johnston's command, then in Georgia. The surrender of General R. E. Lee, at Appomattox, caused his final return to Charlottesville, where he resumed the practice of his profession. Was appointed demonstrator of anatomy in the University of Virginia; entered upon his duties in October, 1865, continuing to 1872. Owing to shattered health, from a dissecting wound, resigned the position and again resumed general practice in Charlottesville. During the summer season, for the past twenty-five years, has been resident physician to some of the principal mineral springs of Virginia; a prominent member of the Medical Society of Virginia since 1871; vice-president of same in 1874 and 1880, and its president in 1883. (It was during his term of office the State board of medical examiners was organized.) Was a member of the American Medical Association since 1875, and the American Public Health Association, in 1878. In 1885 he was elected and served one term as professor to the chair of Obstetrics and Diseases of Women and Children in the University of Florida, at Tallahassee; also filled the chair of Anatomy; resigned both chairs; appointed by the governor of Virginia a member of the State medical examining board, in 1890. Medical papers published: "Treatment of Ingrowing Toe Nails;" "Use of Iodoform in Syphilis;" "Origin and Use of Natural Mineral Waters;" "Cremation and Inhumation Compared," and "Ancient Medicine, its History." Among the more important surgical operations—removal of a fibroid growth, involving right parotid gland (1863), with recovery; removal of right clavical for osteosarcoma (1889), with recovery.

CHAPMAN, Henry C., of Philadelphia, Pa., son of Lieut. George W. Chapman, United States navy, grandson of Dr. Nathaniel Chapman, formerly Professor in the University of Pennsylvania, was born in Philadelphia, August 17, 1845. He was educated at the University of Pennsylvania, graduating from the medical department of that institution in 1867. After spending three years in Europe he returned to this country, and settled in Philadelphia. He is a member of the Academy of Natural Sciences, and of the American Philosophical Society of Philadelphia. He has held the position of prosector of the Zoological Society. He is the author of "Evolution of Life," and of various papers in the Proceedings of the Academy of Natural Sciences and in medical journals. He was formerly physician of the coroner of the city of Philadelphia. He was for some time lecturer on anatomy and physiology at the University of Pennsylvania. Since 1880 he has been Professor of Institutes of Medicine and Medical Jurisprudence.

CHAPMAN, Nathaniel, of Philadelphia, Pa., was born in Summer Hill, Fairfax county, Va., May 28, 1780, and died July 1, 1853. His father was of English, and his mother of

Scotch descent. He was educated at the Classical Academy of Alexandria, and commenced the study of medicine with Dr. Weems of Georgetown, from whom he was transferred to Dr. Dick of Alexandria, whose name has been handed down in connection with the last hours of Washington. In 1797 he went to Philadelphia to attend the lectures in the University of Pennsylvania. While a student he attracted the notice of Dr. Benjamin Rush, and became one of his private pupils. At his suggestion Chapman presented an inaugural thesis on hydrophobia in answer to an attack on Dr. Rush's favorite theory on the pathology of that disease. Upon the completion of his studies at the university and graduation in 1800, Dr. Chapman went abroad, and in London attended the teachings, among others, of the celebrated surgeon Mr. Abernethy. He afterwards spent some time in Edinburg, and returning to the United States settled himself in Philadelphia in 1804. Very soon after his return from Europe he gave a private course on obstetrics, and his success in this line led to his appointment as assistant of Dr. Thomas C. James, then professor of midwifery in the University of Pennsylvania and three years later he became professor of materia medica in this institution. Having succeeded Dr. Barton in the chair of materia medica, in 1813, Dr. Chapman was fortunate in maintaining the interest that had attached to that important branch; not by natural history, or even strictly pharmacological expositions, but by luminous explanations of the scope and purposes of the materia medica—of its proper application to the cure of disease. In his prelections upon this subject he was especially happy, pointing out in detail the appropriate use of each particular article, and illustrating his remarks by sound appeals to his abundant experience; indeed, his instruction partook so much of a clinical nature, and placed so much valuable practical information at the command of the student, that it could not but fix the attention of the latter, if solicitous to prepare himself for the responsible duties of his profession. In this chair he laid the foundation of that eminence he attained when called upon again to succeed Dr. Barton and assume the responsibilities of the chair of practical medicine. His "Elements of Materia Medica," published in 1817, contain the exemplification of his manner of communicating useful suggestions and practical directions for the employment of medicinal articles. With reference to this work we may appropriately quote the comment of one qualified to express an opinion. In the account of the contributions to this branch of medicine by American physicians, Dr. Wood uses the following language: "Hitherto we have done little more than add to the products of the European press our peculiar knowledge in relation to indigenous medicines. Dr. Chapman took a bolder flight, and by the publication of a systematic and original treatise, containing elaborate doctrine, interesting practical views, and highly important therapeutical facts of a general character, placed us at once upon a footing with English authorship in this department of medicine." In 1816 Dr. Chapman received his appointment as professor of the theory and practice of medicine, of institutes, and clinical medicine. In 1850 Dr. Chapman resigned the chair of practice which he had so

eminently filled during the long period of thirty-four years. Although American medicine is under lasting obligations to this great physician, it would be unfair to attribute to him greater power or capacity than existing opportunities warranted. In this early day it must not be supposed that he could change the character of medicine, or that, by the means at his command as a practicing physician, he could elevate it from its position as a highly cultivated art, to a lofty science. "At this time general anatomy was unknown. Pathological anatomy had revealed only the grosser alterations of the organs. Physiology shed no illuminating ray on pathology and practice. Pathology was almost entirely conjectural; chemistry was incapable of solving the actions of living beings, and the attempts made were deceptions; while the microscope had not poured forth its revelations of minute and elementary structure. What could be done, under these circumstances, but to collect together the most perfect portions of the wreck of the methodical system, which in reality were the embodied experience and tested facts of centuries of practical observation, and to rearrange and reconstruct them into systematic order. By this plan he could, in the most effective manner, accomplish the main object of his chair, the teaching of the best practical methods of treating and curing diseases, and of educating for society sound medical practitioners." One of his biographers, Dr. Joseph Carson, writes, that there were two prominent features in the medical teaching of Dr. Chapman, who was a thorough solidist and vitalist. The *first* was his advocacy of the doctrine of association between the organs and systems of the body in health and disease; the agency of their associated actions being due to "sympathy" or consent of parts. This doctrine will be found to be recognized in some form of other through the writings of the most celebrated physician of all time; but the details of its expression were indefinite and vague, and it was not even admitted that the nervous system was necessary for the harmonious operation of the organs and tissues, for the performance of uniform functional acts; and hence sympathies were spoken of, for want of a more appropriate term, beyond the limits of those now admitted. It should be remembered that at the commencement of the present century the functions of particular nerves and of the different portions of the nervous centers were unknown. The discovery of the motor and sensitive columns of the spinal marrow first lifted the veil which concealed the secret machinery of nervous action, and led to the only philosophical method of experimenting—the study of the nerves separately in their functional relations. It is to be inferred that Dr. Chapman derived his ideas of sympathy from the writings of Cullen, and of the professors of the French school, and he adhered to them to the termination of his career, during which revelation upon revelation was made in this line of research. By the investigations of Sir Charles Bell, Magendie, Flourens, Müller, Hall, Bernard, Brown-Sequard and others, sympathy from a mythical condition has assumed a tangible form for the enlightenment and guidance of practitioners of medicine and surgery. The error committed by Dr. Chapman was the rejection of the proof of an in-

troductio into the circulation of medicinal or noxious substances, which has now become irrefragable and constitutes, in greater measure, the foundation of modern medicine. The second peculiarity of Dr. Chapman's teaching, was the prominent part attributed to the stomach in connection with numerous diseases; indeed, the "fons et origo" of a large number of them. He, however, was not a maintainer of the opinion that gastric derangement was uniformly inflammatory; and in this he differed from Broussais, but he fully recognized the stomach as a ruling power in the maintenance of disease, and in directing the means for its removal. In this particular he most probably, while in London, was seriously impressed by the opinions and practice of Abernathy, which are as worthy of commendation at the present time as they were when first urged upon the profession by that wise and skillful surgeon. Therapeutics was essentially Dr. Chapman's forte, and in this line, from his ready and abundant resources, he was a master. The truth of the following character of Dr. Chapman, as a lecturer, in the eulogy of his colleague, Dr. Jackson, must be accepted by all who have listened to his public efforts: "He was self-possessed, deliberate, and emphatic. Whenever warmed with his subject, his animation became oratorical. Often the tedium of dry matter would be enlivened by some stroke of wit, or happy pun, an anecdote, or quotation. He was furnished with stores of facts and cases, drawn from his own large experience and observation, illustrating principles, diseases, or treatment under discussion. His bearing was dignified, manners easy, and gestures graceful. He had a thorough command over the attention of his class, with whom he always possessed unbounded popularity. His voice had a peculiar intonation, depending upon some defect in the conformation of the palate, and rendered the articulation of some words an effort. The first time he was heard the ear experienced some difficulty in distinguishing his words. This was of short duration; for one accustomed to the tone, his enunciation was remarkable for its distinctness. Students would often take notes of his lectures nearly verbatim." For many years he gave clinical lectures in the hospital of the Philadelphia almshouse. For some time he was president of the Philadelphia Medical Society, president of the American Philosophical Society, and was the first president of the American Medical Association. In 1820, Dr. Chapman became the proprietor and editor of the *Philadelphia Journal of the Medical and Physical Sciences*. In 1825 he was assisted in conducting it by Dr. Dewees and Dr. John D. Godman. This periodical, in 1827, became the *American Journal of the Medical Sciences*, and has been continued under the able editorship of Dr. Isaac Hays. During his lifetime, Dr. Chapman furnished some lectures to the *Medical Examiner*, and a few others were printed in book form. His published works includes "Select Speeches, Forensic and Parliamentary;" "Elements of Therapeutics and Materia Medica;" "Lectures on Eruptive Fevers, Hemorrhages and Dropsies, and on Gout and Rheumatism;" also "Lectures on the Thoracic Viscera."

CHAPMAN, W. Carroll, of Louisville, Ky., was born in Hartford, Ky., June 17, 1863, of American parents, descended

from English and Scotch. He was educated in private school until thirteen years old, when he was sent to Cecilian College until within a few months of graduation. Was forced to leave at this time on account of illness. He began the study of medicine in his seventeenth year, under Dr. S. L. Berry of Hartford, Ky., taking also a special course at the Hartford College in chemistry, anatomy and physiology. He graduated in medicine in 1884 at the College of Physicians and Surgeons in Baltimore. He received the appointment of resident physician of the Maternité; was also appointed assistant demonstrator of chemistry in the laboratory of the same college. During the summer of 1883 he was assistant in the Charity Eye and Ear Hospital in Baltimore. He practiced medicine for a few months at Cecilia, Ky., during which time he was physician and surgeon to the Hardin County Alms House. He resigned here and moved

W. Carroll Chapman.

to Louisville late in the year of 1885, having practiced medicine there since that time. Dr. Chapman is author of "Consumption and the Prophylactic Treatment," "Resorcin as an Antipyretic," also "The Toxic Effect of Tobacco Vapor." He is the editor of the *New Albany Medical Herald*, secretary of the Jefferson County Medical Society, and a member of the Kentucky State Medical Society, and of the Mississippi Valley Medical Association.

CHARLTON, Samuel H., of Seymour, Ind., was born in Jefferson county, Ind., November 1, 1826, being the eldest of eleven children born to Thomas and Alice Henry-Charlton, who were among the earlier settlers both being of Scotch-Irish descent. At the age of four, his father removed to Switzerland county, where he raised and educated his children. The subject of this sketch attended the common schools of his native section, and later, the Switzerland County Seminary, at Vevay. In 1846, at the age of twenty, he commenced the study of medicine, with Dr. Handy T.

Davis, then practicing medicine at Pleasant, near Vevay; and later continued his studies with Dr. T. C. Gale, of Vevay. In the spring of 1850, after attending a course of lectures at the Western Reserve Medical College, at Cleveland, Ohio, he commenced the practice of his profession at Hardenburg, Jennings county, Ind. In December, 1852, he was married to Cordelia Andrews, daughter of Hon. Alanson Andrews and Laura Harding Andrews, of Vernon, Jennings county, to which place he removed in 1854. In March, 1858, he removed to Seymour, Jackson county, where he permanently located, and is still engaged in the practice. He graduated from the Louisville Medical University in 1871. He was assistant surgeon of the Sixth Indiana Regiment, during the civil war. In 1878 he was president of the Jackson County Medical Society; in the same year was president of the Mitchell District Medical Society; in 1881 was

Samuel H. Charlton.

first vice-president of the Tri-State Medical Society of Indiana, Illinois and Kentucky; in 1882, was vice-president of the Indiana State Medical Society, and in 1888 was president of the Indiana State Medical Society; in 1887, he became a member of the International Medical Congress, which met at Washington city, and served as a member of the council of the section on diseases of children. In 1890, he was appointed a member of the pension board of examining surgeons, at Seymour, and at its organization was elected president of the board. Dr. Charlton and his wife are both zealous members of the First Presbyterian church of Seymour; he has been a ruling elder for twenty years, and was, in 1879, commissioner to the general assembly, at Saratoga, N. Y. In his fraternal relations he holds a membership with the orders of Masons, Odd-fellows and Knights of Honor, in which he has held several positions. In politics, the

doctor has always been a Republican. He is possessed of a genial, cordial nature—qualities that endear him to all who know him.

CHASSAIGNAC, Charles L., of New Orleans, La., was born in that city January 25, 1862. He is of French descent on his father's side; his mother was a Louisianian. His father and uncle were both celebrities; the former, Prof. Eug. Chassaignac, was a talented composer of music, while the latter, Dr. E. Chassaignac, was a noted surgeon in Paris, the inventor of the "ecraseur," the originator of surgical drainage and drainage tubes, and a prolific writer of surgical treatises. Dr. Chassaignac was early imbued with the idea of taking up his uncle's profession and commenced reading medicine soon after graduating from the New Orleans High School. He entered the medical department of the University of Louisiana in 1880, with Dr. A. W. De Roaldes as his preceptor. As a result of his success in a competitive examination he became a resident student of the great Charity Hospital of New Orleans in 1881 and served in that institution two years, graduating in 1883. The following year he took the position of chief of clinic to Prof. T. G. Richardson, who was then professor of surgery, and served him up to the time of Prof. Richardson's retirement from active practice and his professorship. Dr. Chassaignac served two terms with Prof. Logan, who succeeded Prof. Richardson to the chair of surgery. He then resigned because his time was too much taken up with other professional duties. At this time he was elected Professor of Genito-urinary and Rectal Surgery in the New Orleans Polyclinic, the foremost post-graduate school in the South; he still occupies this chair, taking great interest in his teaching and in the welfare and progress of the "Polyclinic." Dr. Chassaignac has been for several years, and is to-day, one of the visiting surgeons of the Charity Hospital and was for one or two years, early in his professional career, surgeon to the New Orleans city police. The doctor still holds the position of district surgeon of the Illinois Central Railroad to which he was appointed nearly ten years ago. He is one of the founders of the New Orleans Training School for Nurses the first of its kind in Louisiana, and is a member of the faculty of that institution. After filling the position of secretary and treasurer of the Orleans Parish Medical Society for three consecutive terms, he was elected president of that society in 1890, and has been re-elected each year to preside over the destinies of the society which he has done a good deal to build up and which owes very much to his energy. He was once vice-president of the Louisiana State Medical Society, and is a member of the National Association of Railway Surgeons. Dr. Chassaignac has often contributed to the pages of the *New Orleans Medical and Surgical Journal*, where his articles have usually attracted some attention, being frequently reproduced in other journals. While the teaching of his branch at the New Orleans Polyclinic causes the doctor to devote a great deal of time and work to genito-urinary and rectal diseases, both in his hospital labors and in his private practice, he has not abandoned as yet the field of general practice and has a remarkably good clientele. Besides all this, the doctor has managed to devote some time to charitable institutions,

and is particularly proud of his record at the Memorial Home, a reformatory institution for young women, where in about five years he has had over one hundred cases of accouchement, most of them in primipara, without the death of one single patient.

Elisha Chenery.

CHENERY, Elisha, of Boston, Mass., son of Elisha and Betsey (Philbrick) Chenery, was born at North Livermore, Maine, August 23, 1829, being classmate in school with Senator Wm. D. Washburn. His ancestor Lambert came over from England with two sons, John and Isaac, in 1630, and settled in Watertown. Subsequently he with Isaac became first proprietors of the town of Dedham, where Isaac settled and became the father of Dr. Isaac Chenery. John married Widow Boylston, mother of Dr. Thomas Boylston, the first physician of Brookline, and through him the grandmother of Dr. Zabdiel Boylston, who introduced inoculation for small-pox into Boston. John had one son by her, after which he was killed in a battle with the Indians at Northfield, in King Phillip's war. Dr. Chenery's great grandfather was at Lexington and Bunker Hill, and his grandfather assisted in caring for the women and children, put in the stockade for protection. About 1790 he moved to Maine. Dr. Chenery, preparing for college, was advised not to take the regular course, but to put more time into medicine which he did, taking the collaterals. So, after a broad preparation, and two courses at Bowdoin and two at Harvard, he graduated at the latter, March 2, 1853. He returned to Maine till 1866, when he came to Cambridge, and to Boston in 1870. At the beginning of the war he was in poor health from overwork, but in 1862 he passed examination for surgeon and enlisted and was prevented from reaching the front by an attack of diphtheria which necessitated his resignation. As early as 1855 he began the treatment of typhoid fever with milk, which was, at least, fifteen years before it was popular in Boston. In 1863 he introduced the hy-

posulphite of soda into the treatment of diphtheria with almost uniform success, if the cases were seen early. From 1877-81 he was professor of pathology and therapeutics and dean of the faculty in Boston Dental College, and professor of principles and practice and lecturer on the diseases of women and children in the College of Physicians and Surgeons of Boston, 1881-85. In 1890 he published a book, "Alcohol Inside Out." He wrote a prize essay on "Food and Cooking," and he has written numerous articles for the medical, religious and secular press. He became a member of the Maine Medical Association the first year after its organization; is a Fellow of the Massachusetts Medical Society and member of the American Medical Association.

CHENOWETH, William J., of Decatur, Ill., was born in Greensburg, Ky., on the first day of December, 1823. His ancestors were amongst the first settlers of that State. His father, John S. Chenoweth, was born in Shelby county, and was married January, 1823, to Eliza Ross, daughter of Capt. William Ross, a Scotchman, then residing in Fayette county. He attended school at Augusta College, Ky., receiving the degree of A. B. in 1841 and of A. M. in 1844. He was married May 19, 1846, to Miss Leforgee, a granddaughter of the celebrated "Mike" Cassidy, a contemporary of Boone and Kenton, and intimate with both of them. While engaged as a book-keeper in his father's store, in Cincinnati, Ohio, the subject of this memoir studied anatomy and physiology under the direction and with the advice of Dr. N. Marshal, at the time one of the most learned and popular physicians in the city. After attending a single course of lectures at the Medical College of Ohio in the winter of 1849-50, he commenced the practice of medicine—at the time

William J. Chenoweth.

a common custom—at Hillsboro, Ky. In the fall of 1852 he matriculated at the University of Louisville, and graduated at that institution

in the following March. Since May 1, 1854, he has made his home at Decatur, Ill. During the late war he was surgeon of the Thirty-fifth Illinois volunteer infantry from September 1, 1861, to December 14, 1862, resigning on account of sickness in his family. He was present at many skirmishes and at two battles (Pearidge and Perryville) and is the only surviving surgeon of the regiment, the first and second assistant surgeon, and the surgeon who succeeded him, having gone to receive the reward of their labors.

CHENOWETH, Cassidy, of Decatur, Ill., son of the preceding, Dr. W. J. Chenoweth, was born March 28, 1848, and was graduated in medicine at the Rush Medical College, Chicago, 1864. Intending to make a specialty of diseases of the throat, he spent several months at the Morrell McKenzie Throat Hospital, in London. But finding, on his return from Europe, that the confinement necessary to office practice, was prejudicial to his health,

Cassidy Chenoweth.

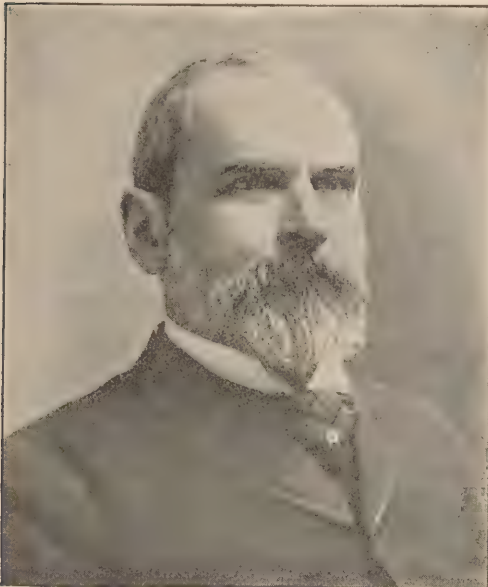

joined his father in a general practice, which, however, has been surgical, rather than medical. The many operations performed by the firm can not be credited to father or son, individually, as but few of the more important operations have been done by one without the assistance of the other, the knife being handled by either of them, or by both, in the same operation, as seemed to be most convenient. They have performed most of the operations ranked as difficult and dangerous—such as ovariectomy, removal of extra uterine foetation, vaginal hysterectomy and lithotomy (left lateral and supra-pubic). Both partners do a very large consultation practice, medical and surgical. Their contributions to medical literature have been limited almost entirely to articles read before the district or State medical societies, of which they were members.

CHEW, Samuel Claggett, of Baltimore, Md., son of the late Professor Samuel Chew, of the University of Maryland, was born in Baltimore,

July 26, 1837. He graduated at Princeton, in 1856, and received his degree of A. M., in 1859. He studied medicine in the University of Maryland, and took his degree of M. D. in 1858, settling in regular practice in Baltimore, where he has since resided, except during a visit to Europe in 1864. He is a member of the American Medical Association, of the Baltimore Academy of Medicine, and of the Clinical Society of Baltimore; and was first vice-president of the Medical and Chirurgical Faculty of Maryland. He is also a member of the Association of American Physicians. He is the author of "Clinical Lectures on Certain Diseases of the Heart, and on Jaundice," 1871; "Papers on Medical Jurisprudence," 1872; "Notes on, Thoracentesis," 1876. In 1864, he was elected Professor of Materia Medica, Therapeutics, and Clinical Medicine in the University of Maryland, and held this position for many years, and is at this time (1893), professor of the principles and practice of medicine in the same institution.

CHISOLM, Julian John, of Baltimore, Md., was born in Charleston, S. C., April 16, 1830, and obtained his degree of doctor of medicine in the Medical School of that city in 1850. After graduation he went to Paris, at that time the brilliant center for medical instruction. At the feet of Velpeau, Nelaton, Desmarres and such leaders in the surgical world, Dr. Chisolm laid the foundation for his future surgical career. On his return home he commenced professional life as an instructor in surgery. In this congenial work he was so successful, that in 1858, when a vacancy occurred in the surgical chair of the Medical College of the State of South Carolina, he was elected to fill it, although the leading surgeons of the South were applicants for the envious position. This Medical College in 1858 had the highest reputation of any medical school south of Philadelphia. Dr. Chisolm, then at the age of twenty-eight, was the youngest professor of surgery in the United States. This chair placed him in command of the surgery of his State. With hands full of work, he erected a private hospital of sixty beds, which he kept full of paying patients. 1859 he spent in Europe, and saw something of military surgery during the Franco-Italian war. When South Carolina seceded in December, 1860, Dr. Chisolm was elected surgeon to the first regiment organized, forming the pioneer of the Confederate army. The first Federal soldiers wounded in the war, at the surrender of Fort Sumter, were left in Charleston under his care. Dr. Chisolm wrote a manual of Military Surgery which was issued from the press simultaneously with the first battle of Manassas. It met with immediate acceptance, and became the text-book for the Confederate army. It was highly praised by the medical press, both of the United States and of Europe, for its concise and valuable information. At the end of the war he resumed work in the Medical College of South Carolina. As dean of the faculty, as well as professor of surgery, he was assigned the duty of reorganizing that institution. 1866 he spent again in Europe, devoting much time to the study of eye diseases, a branch of surgery for which he showed an especial fondness. In 1866 he moved to Baltimore, and was elected to a chair of operative surgery in the University of Maryland. At a subsequent period he had a

chair of eye and ear diseases created for himself in the university, which chair he still fills. In 1877 he established the Presbyterian Eye, Ear and Throat Charity Hospital, an institution supported by the Presbyterians of Baltimore. This hospital has been a success from its first day of opening. It is visited by over 10,000 patients a year, and furnishes an enormous amount of surgical work. Dr. Chisolm has operated on over 2,000 cases of cataract alone; exceeding by several hundreds the list of any American surgeon. As an ophthalmic surgeon Dr. Chisolm is universally known. At various times he has been presiding officer of the ophthalmic section of the State Medical Society; of the American Medical Association; of the Pan-American Medical Congress and of the International Medical Congress. It is thus seen that he has filled every position of honor in the gift of the medical profession. In 1892 the degree of LL. D. was conferred upon him

Julian J. Chisolm.

by the University of South Carolina. Dr. Chisolm has been a liberal contributor to medical journals.

CLARK, Alonzo, of New York city, was born in Chester, Mass., March 1, 1807, and died September 13, 1887. He was educated at Williams College, from which he graduated A. B., in 1828, and received his degree of M. D. from the College of Physicians and Surgeons of New York, in 1835. He began his professional career as professor of Pathology and Materia Medica in the Vermont Medical College, Burlington. From 1848 to 1855, he filled the chair of physiology and pathology in the College of Physicians and Surgeons of New York. In the latter year he became the Professor of Pathology and Practical Medicine in the same institution, and held the position until 1885. He was appointed visiting physician to the Bellevue Hospital, New York, and was also president of the medical board and consulting

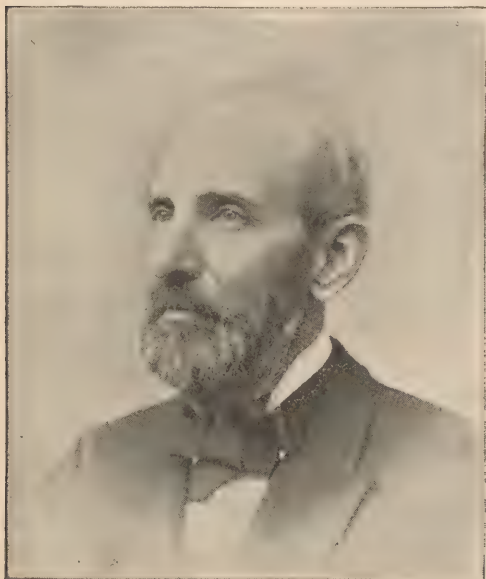

physician to St. Luke's Hospital, New York, in 1861, as well as consulting physician to the Northeastern Dispensary and the Northern Dispensary. He was a member of the New York State Medical Society, of which he was elected president in 1853; of the American Medical Association; of the New York Medical and Surgical Society; of the York Society for the Relief of Widows and Orphans of Medical Men; of the New York Pathological Society, and of the New York Academy of Medicine. Professor Clark has made valuable and practical contributions to the medical press, and originated the treatment of acute peritonitis by large doses of opium.

CLARK, John H., of Mechanicsburg, Ohio, was born in Champaign county, Ohio, September 28, 1829. His early ancestors emigrated from England. He attended the common schools of the neighborhood and the Ohio Wesleyan University, at Delaware, Ohio; studied medicine and graduated at the Starling Medical College, at Columbus, Ohio, in 1853. He began the practice of medicine at Mutual, in his native county, removed in 1859 to Decatur, Ill., returned in 1861 to his present location, where he has since continued in active general practice, with the exception of the period of his service as medical superintendent of the Asylum for the Insane, at Dayton, Ohio; that is, from March 1, 1874, to May, 1876. Also during the war of the rebellion he rendered three months' medical service in the United States Sanitary Commission. He is a member of the Champaign County Medical Society, of which he was president in 1870; of the Ohio State Medical Society, and of the American Medical Association. He has been an occasional contributor of medical journals.

CLARK, Simon Tucker, of Lockport, New York, was born in Canton, Mass., October 10, 1836, and died December 24, 1891. He was graduated at the Berkshire Medical College; settled in Lockport to practice, in 1861, and became a member of numerous medical and scientific organizations. He had been a Professor of Medical Jurisprudence in Niagara University, Buffalo. Prior to his death, Dr. Clark was a well-known insanity expert, and originated the term "mania transitoria," in his testimony in the Pierce-Bullock murder case, in Lockport, in 1871.

CLARKE, Augustus Peck, of Cambridge, Mass., son of Seth Darling Clarke and Fanny (Peck) Clarke, was born in Pawtucket, Providence county, R. I., September 24, 1833. His father, Seth Darling Clarke, was of the eighth generation of Joseph Clarke, who with his wife, Mrs. Alice Pepper Clarke, came with the first settlers comprising the Dorchester company that embarked at Plymouth, England, on the twentieth day of March, 1630, in the ship "Mary and John," a vessel of 400 tons, Captain Squeb, master. Joseph Clarke, the emigrant ancestor was born in Suffolk county, England, where his family had long been seated. Dr. Clarke's mother, Fanny Peck Clarke, was of the sixth generation in descent from Joseph Peck who came in the ship "Diligent" from Old Hingham, England, to Hingham, Mass., in the year 1638. She was also of the twenty-sixth generation in descent from John Peck, of Belton Yorkshire, knight. Dr. Clarke's great grandfather, Captain Ichabod Clarke, served with distinction in the war of the revolution; his maternal grandfather, Joel

Peck, was with General Washington, and participated in the battle of Rhode Island, August 27, 1778. Dr. Clarke completed his preparatory course in the University Grammar School at Providence, R. I., and entered Brown University in September, 1856. Received from that University the degree of A. M. in the class of 1860. He studied medicine under the direction of Dr. Lewis L. Miller, of Providence, who at that time was by far the most distinguished surgeon of Rhode Island. He received the degree of M. D. from Harvard University in the class of 1862. He entered the army as assistant surgeon of the sixth regiment New York cavalry, August, 1861. He served in the Peninsular campaign conducted by General McClellan, during the seven days' battles, was wounded and taken prisoner at the battle of Savage Station, Va., June 29, 1862. He was promoted to the rank of surgeon of the sixth New York cavalry, May 5, 1863. At the opening of the campaign made

Augustus P. Clarke

by General Grant in the spring of 1864, he was appointed surgeon-in-chief of the second brigade, first division, of the cavalry corps, whose glorious achievements rendered immortal the name of Sheridan. He was the chief medical officer of that brigade until the closing of the campaign which commenced early in the spring of 1865, when he was appointed surgeon-in-chief of the entire first division of cavalry. These arduous labors he also performed, until the division was disbanded, July 1, 1865. During those four years' service he participated in upwards of eighty-two battles and engagements with the enemy. At the close of the war he was brevetted lieutenant-colonel for faithful and meritorious conduct during his term of service. After the completion of his military service in 1865 he traveled abroad, and devoted much time in attendance at the various medical schools and hospitals in London, Paris, and in other great centers, for the purpose of fitting himself more particu-

larly for obstetrical, gynecological and surgical work. In 1866 he removed to Cambridge, Mass., where he soon established a reputation in the practice of medicine, in which profession he has since continued his labors. Dr. Clarke was married in Bristol, R. I., October 23, 1861, to Mary H. Gray, the author and poet, a daughter of the late Gideon and Hannah Metcalf Orne Gray. Of this union are two daughters; Inez Louise and Genevieve Clarke. For 1871-3 he was elected to the Cambridge common council and for 1874 to the board of aldermen. He declined further municipal service. He is a member of the Massachusetts Medical Society and has been member of its council. He has been an active worker in the Gynecological Society of Boston and is now the president of that body; member of the American Academy of Medicine and of the American Association of Obstetricians and Gynecologists, and of the American Public Health Association. He is a member of the American Medical Association and has been a delegate to the British Medical Association. He is one of the founders of the Cambridge Medical Society and was for several years the secretary. Also a member of the Ninth International Medical Congress at Washington 1887, and of the Tenth International Medical Congress at Berlin, Germany, in 1890. Member for Massachusetts on the committee to organize the Pan-American Medical Congress (or representatives of the medical profession of the Western hemisphere). Dr. Clarke still enjoys a high reputation in general practice, though he has for a long time been engaged in the practice of the more important branches of surgery, and of gynecology. After the close of the congress in Berlin he visited the great cities of Europe, including London, Edinburgh, Paris, Vienna, where he devoted again much time to the study of their hospital service. Dr. Clarke has been noted for his scholarly productions and for his facile pen. In the midst of the multitudinous duties of his professional work he has been able to make important researches relating to gynecology and investigations pertaining to the development of art culture. He has frequently contributed articles to the public press and to different medical societies and journals. The following are the titles of some of the papers Dr. Clarke has contributed: "Series of Histories of Wounds and other Injuries;" "Medical and Surgical History of the Rebellion," 1865. Also to the leading medical journals of this country and Europe articles entitled: "Cases of Tracheotomy;" "Cases of Puerperal Peritonitis," (1868); "Cases of Strangulated Hernia operated upon Antiseptically," (1870); "Perforating ulcer of the Duodenum," (1881); "Removal of Intra-Uterine Fibroids," (1882); "Cerebral Erysipelas," (1883); "Hemiplegia," "Uterine Displacements," (1884); "Obstinate Vomiting of Pregnancy," (1885); "Vascular Growths of the Female Meatus Urinarius," Medical Press and Circular, London, England, and Transactions of the Ninth International Medical Congress, (1887); "Pathogenic Organisms," "Rabies and Hydrophobia," (1883); "Fracture of the Cervical Vertebrae," (1884); "Induced Premature Labor," "Renal Calculi," (1885); "Pelvic Cellulitis," "Early and Repeated Tapping in Ascites," (1886); "Abortion for Uncontrollable Vomiting of Pregnancy," "Antepartum Hour-glass Con-

striction of the Uterus," (1888); "Chronic Cystitis in the Female," (1890); "Treatment of Certain Cases of Salpingitis," "Management of the Perineum During Labor," "Rapid Dilatation of the Cervix of the Uteri," "Faradism in the Practice of Gynecology," "The Treatment of Placenta Previa," "Adherent Placenta, its Causes and Management," "On the Importance of Early Recognition of Pyosalpinx as a Cause of Suppurative Pelvic Inflammation," Transactions of the Tenth International Medical Congress, Berlin (1890); published also in the German language in the *Deutschen Medicinischen Wochenschrift*, Berlin, and in the *Centralblatt für Gynäkologie*, Leipzig (Germany); "On the Tenth International Medical Congress, at Berlin," Letter on the Journal of the American Medical Association; "The Influence of the Position of the Patient in Labor in Causing Uterine Inertia and Pelvic Disturbances," noticed in the *Medical Press and Circular*, London, England; "Some of the Lesions Induced by Typhoid Fever," "Parametritis, its Etiology and Pathology," "A Certain Class of Obstetric Cases in which the Use of Forceps is Imperatively Demanded," "Some Points in the Surgical Treatment for the Radical Cure of Hernia," "Post-Partum Hemorrhage—its Etiology and Management," (1891); "Origin and Development of Modern Gynecology," (1892).

CLARKE, William E., of Chicago, Ill., son of Dr. Thaddeus and Deborah Baker Clarke, was born in Lebanon, Conn., Feb. 22, 1819. His father, and both his grandfathers, were eminent physicians, the latter both doing duty as medical officers in the army of the Revolution. His father assisted in the formation, and was the first resident, of the Connecticut Medical Society. His early education was under the supervision of his mother, a woman of rare culture. Later he entered the Rochester Collegiate Institute, then under the management of Chester Dewey, one of the profoundest scholars of the day, who also was Professor of Chemistry and Botany in the Berkshire Medical College, at Pittsfield, with whom Clarke pursued his classical and scientific studies, ultimately becoming his assistant in the Institute and Medical College. He commenced the study of medicine under Professor E. M. Moore and Frank H. Hamilton, who gave instruction to a private class in Rochester, N. Y. His studies for the next five years were continued under Professor Moore, he, in the meantime, attending one course of lectures at Berkshire and two at the Vermont Medical College, from which he graduated in 1845. After practicing two years with Dr. Moore he removed to Cold Water, Mich., where he settled, in the fall of 1847, and where he married Miss Harriet H. Hale, of Kalamazoo, Mich. In the fall of 1852, in view of the larger opportunities for surgical practice, he removed to Chicago, where he was employed as surgeon by both the Michigan Central and Michigan Southern railroads, and cared for most of the wounded in the calamitous collision of the trains in the spring of 1853. The climate of Chicago proving too severe for the health of Mrs. Clarke, the doctor was obliged to relinquish his position in Chicago, and after spending some time in travel he returned to Michigan, and remained, doing a major part of the surgical practice for a large section of the country, till the spring of 1861, when he was

appointed surgeon of the Fourth Regiment Michigan Volunteers. He immediately entered on duty with the army of the Potomac before Washington, and continued to serve with the regiment at the siege of Yorktown; was the only medical officer with the first reconnaissance by Custer's Cavalry and the Fourth Regiment, on the banks of the Chichominy. At that time the Mississippi Tigers were encountered, some one hundred and eighty killed, and a number taken prisoners. The wounds of the Union soldiers were dressed on the field. Then they were removed to Gaines Hill, together with the wounded Confederates. The doctor also assisted in the care of the wounded in the seven days' fight, and on reaching Harrison's Landing established a hospital, and after doing duty for some days he succumbed to sickness and was ordered north on a leave of absence. His illness was so serious that he did not reach home for some weeks. Upon his recovery, at the urgent solicitation of Col. Henry C. Gilbert, of the Nineteenth regiment just recruited, he consented to be transferred to that regiment with the condition that he should retain the seniority of his first commission and it was so arranged by the war department. After taking the field in Kentucky he served as brigade surgeon during the winters of 1862-3. In the following spring at Brentwood he again received a leave of absence for sickness but before he could leave camp he was captured with the post and retained two weeks as a prisoner of war. After the exchange, with health much impaired, he again joined the regiment but became prostrated, and believing that he could no longer be of service in the field, resigned his commission in July, 1863. When he had somewhat recuperated he received an intimation from the medical department at Washington that he could have a position in the hospital there. He entered on duty at Carver United States General Hospital, his wife accompanying him and doing faithful and efficient duty among the sick and wounded, but at last the health of Mrs. Clarke compelled him to leave with her for their home. She died on the way. After her burial he returned to his duty at Washington and remained till the close of the war, when he again located at Chicago. For his second wife he married Miss Mary Reed, who from childhood had been a resident of that city. He has had a fair share of medical, surgical, and gynecological practice, doing as much business as impaired health would permit. He is a member of the City, State, and National Medical Societies, and of the Chicago Gynecological Society, consulting surgeon for the Hospital for Women and Children, and consulting gynecologist to Presbyterian Hospital.

CLEMENT, George Colburn, of Haverhill, Mass., born at Milford, Mass., August 15, 1855, is a son of James H. Clement. His mother is Clara Erskine Clement, the well-known author of various works on art. He received his early education under private instruction. In 1871 he entered Dartmouth College; remained but one year, when he went to New York, and began the study of his profession, as a pupil of the late A. B. Crosby, M. D., then professor of anatomy at Bellevue. Failing health obliged him to give up after a year, and until 1876 he traveled in South America and California; then resumed his studies at the Harvard

Medical School, Boston, graduating in 1880. He was house officer in the Boston City Medical Hospital for eighteen months, also for six months in Free Hospital for Women, Boston. In August, 1880, he began practice in his present field; has filled the office of city physician for six consecutive years, and was even one of the first of staff surgeons appointed to the Haverhill City Hospital. Although a general practitioner, Dr. Clement takes a special interest in surgery, and has made a local reputation in this direction. At present he is devoting himself as much as possible to specially treating the eye and ear. In 1885, he married Matilda H. Kimball, daughter of the late Geo. A. Kimball, of Haverhill. They have two children. He is a member of Massachusetts Medical Society, Haverhill Medical Club, Monday Evening Club, Wachusett and Pentucket Clubs of Haverhill, University of Boston, and Cor-

G. Colburn Clement

inthian Yacht Club, of Marblehead; also a member of the Knights of Pythias and Haverhill Lodge, B. P. O. of Elks.

CLEVENGER, Shobal, of Chicago, was born March 24, 1843, in Florence, Italy, during his parents' temporary residence there. His father was the celebrated American sculptor whose busts of prominent authors and statesmen are in Boston, New York, and Philadelphia public art collections. He was educated in the public schools of New Orleans and St. Louis, his scientific education being acquired by self-instruction while engaged in civil engineering, meteorology, etc., in government employ. During the civil war he was promoted from artificer in Company L, First Missouri United States Engineer Corps to first lieutenant in Company K, Tenth Tennessee infantry, and for the year previous to the battle of Nash-

ville held command of the Sherman barracks, the general recruiting rendezvous of Tennessee. At the close of the war he engaged in surveying in Montana, Dakota, Nebraska, and Iowa, and was appointed deputy United States surveyor of public lands for Dakota Territory. He built and owned a third interest in the first telegraph line extending from Sioux City to Ft. Sully, a distance of 300 miles along the Missouri river and made preliminary surveys as chief engineer of the Dakota Southern railroad. He wrote several engineering contributions to *Van Nostrand's Eclectic Engineering Magazine*, and Van Nostrand of New York published his "Treatise on Government Surveying," which since 1874 has run through several editions and is used in colleges and by United States engineers in the field. In 1874 he abandoned engineering and began the study and practice of medicine under the tutelage of army surgeons while serving as meteorological observer for the United States Signal Service at Ft. Sully, Dakota. He graduated from the Chicago Medical College in 1879, and devoted himself to the specialty of nervous and mental diseases assisted by the instruction and personal friendship of Dr. J. S. Jewell and Dr. E. C. Spitzka. In 1883 he was appointed pathologist of the Cook County Insane Asylum, which position he held till 1885, during which period he enjoyed special advantages for studying insanity on the wards and its pathology in the dead house and laboratory. Returning to Chicago he was appointed to the charge of the nervous and mental disease departments of the Michael Reese and Alexian Brothers' Hospitals, two of the largest and best establishments in the West. He was elected to membership in the American Electrical Society, American Neurological Association, American Association for the Advancement of Science, American Microscopical Society, Association of American Anatomists, American Anthropometric Society, Illinois Microscopical Society, Chicago Medical Society, Chicago Biological Society, Chicago Electrical Society, of which he was vice-president in 1881, and was one of the founders of the Chicago Academy of Medicine, of which he was secretary during 1891 and 1892. During 1881 and 1882 he lectured on "Artistic Anatomy and the Sciences Useful to the Artist" at the Chicago Art Institute, the lectures being published serially in the *American Lithographer* of 1886. F. A. Davis, of Philadelphia, announced the lectures as in press in book form. In 1890 the doctor gave a course of lectures on physics (heat, light, sound, electricity, etc.), to the students at the Chicago College of Pharmacy. In 1885 he gathered together many of his scientific essays previously published in the *American Naturalist* and other journals, and under McClurg & Co.'s imprint they were produced in book form entitled "Comparative Physiology and Psychology." In 1889, a medico-legal work of 400 pages, entitled "Spinal Concussion," was published for him by F. A. Davis of Philadelphia, and this book has been extensively sold. The doctor is probably more widely known as the discoverer of the law regulating the distribution of valves in the veins, which he formulated in the statement that "Only dorsad Veins are Valved," but much more important work upon the brains of man and animals is embodied in his psychological essays. His writings were

mainly contributed to the *American Naturalist*, *Journal of Nervous and Mental Diseases*, *Alienist and Neurologist*, *Journal of Neurology and Psychiatry*, *Sidereal Messenger*, *Chicago Medical Review*, *Chicago Journal and Examiner*, *American Journal of Microscopy*, *Chicago Druggist*, *New York Science*, *Chicago Open Court*, *Journal of the American Medical Association*, *Philadelphia Medical Times and Register*, *North American Practitioner*, *Boston Medical and Surgical Journal*.

CLINE, Lewis C., of Indianapolis, Ind., was born near Cloverdale, Putnam county, that State, October 16, 1851. He is the sixth son of Nicholas Cline and is of German and English descent. His early life was divided between labor on a farm during the "crop" seasons and the attendance of short terms of school in the winter. At the age of sixteen, young Cline, by the consent of his mother and older brothers (his father having died three

Lewis C. Cline

years previous) resolved to leave the farm and begin the battle of life by a reliance upon his own resources. He soon found employment, and by careful planning and economy accumulated means to continue his education, and eventually to take a course of study in Asbury (now De Pauw) University, after which he was engaged for two years in teaching public schools. In 1876 he began the study of medicine under the preceptorship of Dr. E. B. Evans, of Greencastle, Ind. On completing the required period of study, he attended the Jefferson Medical College, Philadelphia, Pa., from whence he received his medical degree in 1879. He then returned to his native county and began the practice of medicine at Putnamville, where he at once acquired the respect and patronage of the best people of that vicinity, and in November of the same year was married to Joanna C. Stevenson, a daughter of the late Dr. A. C. Stevenson, of Green-

castle, one of Indiana's greatest pioneer physicians and surgeons. In the spring of 1880, Dr. Cline entered into a partnership with Dr. R. F. Stone, at Bainbridge, a flourishing town in the northern part of his county. This pleasant association continued until the following autumn, when after an extensive acquaintance and a thorough introduction into the practice of the community, assisted by the good will and courtesy of Dr. Stone, this partnership was, by mutual consent, dissolved, and the latter physician removed to Indianapolis. After six years of active professional work at Bainbridge, the subject of this sketch also removed to the city of his present residence, where he continued in general practice until he had, by a course of study, fitted himself for that line of work which he intended to adopt as his future specialty. During the winter and spring of 1887-88, he attended the Post-graduate School and hospitals of New York, where he took a course of study with special reference to the disease of the throat, nose and ear. He supplemented his studies during the following year by taking a course in the Mackenzie Throat Hospital, London, and also attended the clinics in the hospitals of Vienna. Since his return from Europe to Indianapolis he has limited his practice to the medical and surgical treatment of diseases of the throat, nose, and ear, in which branch of practice he is recognized as one of the most popular and successful practitioners of Indiana. In 1889, he was appointed to deliver a course of lectures on his specialty in the Medical College of Indiana; and in 1890 he was elected Professor Laryngology and Rhinology in the same institution, which chair he still holds, having filled the position with credit to himself and the school. Dr. Cline is a member of the staff of the Indianapolis City Hospital and City Dispensary, and has performed the work appertaining to rhinology and laryngology in the latter institution for the last three years. He is also a member of the Indianapolis Surgical Society, the Marion County Medical Society, the Indiana State Medical Society, the Mississippi Valley Medical Society, the American Rhinological Association, and the American Medical Association. He has contributed papers, on various occasions, to all these societies, and has read papers before many of the county societies throughout his State.

CLOPTON, A. G., of Galveston, Texas, was born in the State of Georgia, in 1830. He received a liberal education, both scientific and classical; studied medicine and graduated M. D. from the medical department of the University of Louisiana (now Tulane University), session of 1851-52. He located first at Camden, Arkansas, and entered upon the practice of medicine, and removed thence, in 1854, to Texas, settling in Cass county. Here, in connection with his extensive practice, he engaged in farming. In 1869 he removed to Jefferson, Texas, and engaged in general practice of medicine and surgery, and soon taking a leading position, which he held up to the time when he was chosen by a very discriminating board of regents to fill the chair of physiology in the medical department of the Texas State University, in 1891. Upon the breaking out of the war in 1861, Dr. Clopton raised a company of infantry, and at their head entered the Confederate service. From captain he was promoted to major of 1st Texas Infantry.

He went before the board of medical examiners in 1863, and passing a rigid examination, was commissioned surgeon, serving in that capacity till the close of the war. He was married in 1854, to Miss Annie M. Henderson, during his residence in Cass county. Dr. Clopton is an old member of the Texas State Medical Association, and was one of its first presidents, having filled that position in 1875. He was also president of the East Texas Medical Association in 1891, at the time of his election to the chair of physiology. He is one of the best-known physicians in that State, and is famous as an extemporaneous speaker, possessing oratorical powers of a high order of excellence.

CLUNESS, William Robert, of Sacramento, Cal., was born at Williams, Ontario, Canada, December 29, 1835, of parents who came from Inverness, in the highlands of Scotland. He received his literary and classical education at the university of Queen's College, Kingston, Ont., and pursued his medical studies in the same department of the same institution, graduating A. B. in 1855 and M. D. in 1859. He settled first at Petaluma, Sonoma county, Cal., but in July, 1863, he removed to Sacramento. He is a member of the American Medical Association, of the Medical Society of the State of California, and of the Sacramento Society for Medical Improvement of which he is president. At various times he has contributed important articles to the medical journals of California.

CLYMER, Meredith, of New York City, grandson of George Clymer, one of the signers of the Declaration of Independence and also one of the framers of the Federal Constitution, was born in June, 1817. He was educated at the University of Pennsylvania, and studied medicine in the medical department of that institution, graduating thence in 1837. He first commenced practice in Philadelphia, but afterwards removed to New York, where he has made a specialty of diseases of the nervous system and of the mind. He is a member of the New York County Medical Society; of the New York Society of Neurology—has been its president twice; of the alumni of the medical department of the University of Pennsylvania, is its senior vice-president, having been elected three times; fellow of the College of Physicians of Philadelphia; and of other medical and scientific societies. His contributions to professional literature have been voluminous both in the way of original matter and as editor of various works. Among these may be mentioned, "Notes on Physiology and Pathology of the Nervous System with Reference to Clinical Medicine," 1874; "The Legitimate Influence of Epilepsy on Criminal Responsibility," 1874; addresses before medical and other societies, including one on Benjamin Rush, M. D.; the annual oration before the society of the alumni of the medical department of the University of Pennsylvania for the centennial year 1876; "The Pathology, Diagnosis, and Treatment of Fevers," Philadelphia, 1846; "Lectures on Palsies and Kindred Disorders," New York, 1870, which were translated and published in France, 1871; "Cerebro-Spinal Meningitis," 1872; "Williams' and Clymer's Diseases of Respiratory Organs," 1855. He also edited the *Medical Examiner* from 1838 to 1844, also "Carpenter's Human Physiology," 1843; "Williams' Principles of Medicine,"

1874; "Carpenter's Elements of Physiology," 1844; "Aitken's Science and Practice of Medicine," 1866, and many valuable articles to the leading medical journals of this country. He held the position of attending physician to the Philadelphia Institution for the Blind in 1842, and to the Philadelphia Hospital from 1843 to 1847, consulting physician to the latter from 1847 to 1851; lecturer on the Institutes of Medicine in the Medical Institute of Philadelphia, 1843, and on the practice of medicine in the same institution in 1849; professor of the principles and practice of medicine in the Franklin Medical College, Philadelphia, 1846; and professor of the institutes and practice of medicine in the University of the City of New York, 1851. He held the position during the war of surgeon United States volunteers; medical director, department of the South, and president of the examining board of the United States navy.

COCHRAN, Jerome, of Montgomery, Ala., was born in Moscow, Fayette county, Tenn., on December 4, 1831. His family were originally Scotch. Most of his early life was spent in Marshall county, Mississippi. He received an English education, with a smattering of Latin, in an old field school and an academy in the adjacent town of Holly Springs. Subsequently, without the help of teachers, he learned the French, Italian, Spanish and Portuguese languages, so as to be able to read them. He graduated in medicine first in the Botanic Medical College of Memphis, in 1857; and subsequently graduated again in 1861, in the medical department of the University of Nashville. In both colleges he was elected valedictorian of the graduating class. His medical preceptor was Dr. W. K. Bowling, Professor of Theory and Practice in the University of Nashville. Early in 1862 he was appointed a surgeon in the Confederate army, and served as such until the end of the war, mostly in military hospitals. He has been an omniverous student in history, chemistry, biology, logic, metaphysics, political economy, and English poetry. He settled in Mobile just after the close of the war, and soon built up a flourishing practice. He was professor of chemistry in the Medical College of Alabama at Mobile from 1868 to 1873, and then until 1877 professor of public hygiene and medical jurisprudence in the same institution. In 1870 he fell into ill health and was soon obliged to relinquish his practice. Since that time he has turned his attention to public hygiene and the bettering of legislation in Alabama in regard to the supervision of the public health and the regulation of the practice of medicine. He wrote the constitution of the Medical Association of Alabama which was adopted in 1873, and which has made that association the most powerful medical organization in the United States. He wrote all the health laws of the State, and has been State health officer since 1879. He wrote all the medical laws of the State, and has been chairman of the State board of medical examiners since 1877. He was at various times between 1870 and 1880, health officer of the city of Mobile, quarantine physician in Mobile bay, and county physician for Mobile county. In 1878 he was a member of the yellow fever commission, and investigated the great epidemic of the year in some thirty-five different towns and cities. In 1879 he was a member of

Jerome Cochran.

the Board of Experts appointed by Congress to confer with the congressional committees on epidemic diseases; and wrote all of the propositions on the origin, cause, and distribution of yellow fever, which received the sanction of the board. He has perhaps seen more of yellow fever and of yellow fever quarantines than any other man now living. He is now a member of the Mobile Medical Society, of which he was at one time president; counselor and senior censor for twenty years of the Alabama State Medical Association; member of the American Public Health Association; member of the American Medical Association; member of the American Academy of Political and Social Science, and vice-president of the Pan-American Medical Congress. His three greatest achievements are: The Medical Association of the State of Alabama; the Public Health System of Alabama; the law to regulate the practice of medicine in Alabama. His addresses and medical papers are too numerous to be mentioned here, but a list of a few of the more important is here subjoined. On the "Principles of Organization and Evolution of Organic Forms," 1871; "History of the Yellow Fever Epidemic of 1873;" "The White Blood-Corpuscle, its Physiology and Pathology," 1874; "History of the Small-Pox Epidemic of 1874-75 in the City of Mobile," 1875; "Yellow Fever in Relation to its Cause," 1877; "Hermaphroditism," 1878; "Theory and Practice of Quarantine," 1879; "Haemorrhagic Malarial Fever," 1884; "The Alcohol Question," 1883; "Problems in Regard to Yellow Fever and the Prevention of Yellow Fever Epidemics," 1888; the article on the "Treatment of Yellow Fever," in Hare's System of Therapeutics, 1891; the sketch of the "Medical History of Alabama," in the Memorial History of Alabama, 1893.

COLEMAN, W. Franklin, of Chicago, Ill., was born in Brockville, Canada, January 6, 1838, and in early infancy moved to a place

founded by his ancestors, and more recently known as Lyn. From the age of six to twelve, his education was directed by the rod of the village schoolmaster. For the three succeeding years he attended the Brockville Grammar School, whence he went to the Academy of Potsdam, N. Y., for an equal period. The study of medicine was begun at McGill College, Montreal, where, at the completion of the third year, an attack of typhoid fever induced him to throw physic to the dogs. Two years later his medical studies were resumed, at Queen's College, Kingston, Canada, and, after two years, a diploma with honors was received (1863). For seven years the young doctor administered advice and medicine in his native village of Lyn. A desire for more thorough knowledge and skill in one special branch of his profession induced Dr. Coleman to turn his attention to the department of the eye and ear. A year was spent in England, at Moorfield's Eye Hospital and the London Hospital, at the close of which (in 1870) he took the degree of M. R. C. S., England. Returning to Canada, he settled in Toronto, forming a partnership with Dr. Rosebrugh, an oculist and aurist of established reputation. He was appointed Surgeon to the Toronto Eye and Ear Infirmary, which position he held during his seven years' residence in that city. With a view of acquiring a still further knowledge in his specialty, Dr. Coleman again went abroad, and spent a year in the clinics of Vienna and Heidelberg, under the guidance of such men as Jaeger, Politzer, and O'Becker. Upon his return to Canada, he selected St. John, N. B., as his field for special practice, and here another seven years' service won him a Rachel and goodly wages.

W. Franklin Coleman

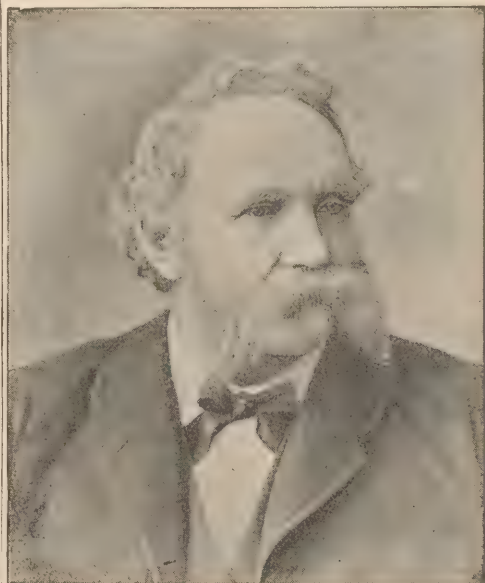

But the oculist's ambition soon outstripped the confines of this quiet Canadian city; and, having, in addition to a large private practice,

gained a rich experience from his position as sole oculist and aurist to the Provincial Hospital, he again turned westward, and decided to settle in this leading city, where, in a few years, he has earned the reward of a good practice and wide reputation. Finding here no school for graduates in medicine, Dr. Coleman, after a year of persevering labor, succeeded in organizing the Chicago Polyclinic. The management of this institution proving unsatisfactory to himself and some of his colleagues, they established the Post-graduate Medical School, of Chicago. Dr. Coleman is a member of the Chicago Ophthalmological Society; of the Chicago Medical Society, and of the Illinois State Medical Society. He is oculist and aurist to the St. Elizabeth and Chicago Charity Hospitals; president and director of ophthalmology in the Post-graduate Medical School of Chicago; also examiner of pension claims for eye and ear applicants. His contributions to ophthalmic literature are: "Tobacco Amblyopia;" "The Ophthalmoscope in the Diagnosis of Brain Diseases;" "The Ophthalmoscope in the Diagnosis of General Disease;" "Is Retinitis Pigmentosa an Evidence of Degeneration in the Offspring of Consanguineous Marriage?" "The Treatment of Retinitis Pigmentosa;" "The Determination and Treatment of Hyperopia;" "Can the Accommodation be Paralyzed by Homatropine?" "The Use of a Plus Cylinder in Myopic Astigmatism of Low Degree;" "A Case of Ptosis from Lipoma;" "Cases in Practice of Sympathetic Ophthalmia," and "Cases of Ossification of the Choroid."

COLES, Abraham, of Monterey, California, was born in Scotch Plains, N. J., December 26, 1813, and died May 3, 1891. When seventeen years old he became tutor of Latin and mathematics in the Plainfield, N. J., Seminary; subsequently he studied law for a few months, and then studied medicine at the Jefferson Medical College, in Philadelphia, whence he graduated in 1835. He established himself in the practice of his profession in Newark, N. J., and became noted as a skillful physician and surgeon. He remained in that city until within a few years of his death. Dr. Coles visited Europe in 1848, and devoted much time working and studying in the hospitals of Paris during the Revolution. He made a second visit to Europe in 1854. Besides numerous translations, he wrote largely on literary, medical, and scientific subjects; took an active interest in promoting local and general education; and became proficient in Greek, Hebrew, Sanskrit, and the modern languages. In 1866 he was president of the New Jersey Medical Society, and his formal address was a physiological poem, "The Microcosm," which has been recently published with his other literary productions.

COLLINS, James, of Philadelphia, Pa., was born in Pineville, Bucks county, that State, October 20, 1831. He graduated B. A. at Amherst College, Amherst, Mass., in 1858, and M. D. at the University of Pennsylvania in 1860. He was a student at George August University, Göttingen, Germany, until the outbreak of the late war of the rebellion; was appointed surgeon of third regiment P. R. V. C., May, 1861; served in the army of Potomac, and was a resident of Libby Prison, Richmond, Virginia, during the summer of 1862; subsequently assistant surgeon and surgeon United States vol-

unteers, and brevet lieutenant-colonel; executive officer at depot field hospital, at City Point, Virginia; and was mustered out at the end of the war. He was Demonstrator of Surgery at the University of Pennsylvania, Philadelphia; consulting surgeon German hospital for twelve years; surgeon of aural department of Philadelphia Infirmary; is member of the American Medical Association and other medical societies; was delegate to International Medical Congress at Washington, D. C., and Berlin, Germany. Was member of the Examining Board of Pension Surgeons, and is active in affairs pertaining to education; also a member of the military order of the Loyal Legion. His contributions to medical literature have

James Collins

been limited to various papers before medical societies. After the war he settled in Philadelphia, where he has since resided.

COLVIN, Darwin, of Clyde, Wayne county, N. Y., was born in Washington county, that State, July 6, 1822. His father, who was descended from a Rhode Island family, was a young physician at this time, and came into Wayne county, N. Y., in 1831. The subject of this sketch was at an early age placed in an academy which furnished exceptional advantages, and in due time was quite thoroughly instructed in Latin and mathematics. After five years of such instruction he determined upon the study of medicine, yet he entered a drug store as clerk, and remained as such until he was eighteen years of age (in the meantime thoroughly informing himself on materia medica and pharmacy), when he entered his father's and uncle's office as a student in medicine. In the autumn of 1841 he matriculated in the medical department of Hobart College in Geneva, New York, where were such professors as the late Frank H. Hamilton, John Delamater, and other noted teachers, and graduated at that institution in January,

1844. He then formed a co-partnership with his father in practice, which business relation pleasantly continued for five years. At the expiration of this period, notwithstanding the copartnership had ceased, they remained in close proximity to each other, almost daily being associated in practice, until the father's death, which occurred thirty years thereafter. In 1845 he married the daughter of Linus Ely, M. D., at that time a prominent physician of Seneca county, N. Y., and began his married life in the house in which he has ever since resided, a period of forty-seven years. He rapidly secured a successful practice, his tastes inclining him to obstetrics and diseases of children. For thirty years he was engaged in an extensive midwifery practice in which he was very successful, and was often asked in consultation. Finally, from declining health, he was obliged, to a great extent,

Darwin Colvin.

to abandon his favorite branch of practice, and confine himself almost exclusively to the practice of medicine. In 1862 he passed the necessary examination and received a surgeon's commission in the Federal army, but was never in actual service. He has devoted much attention to the study of insanity and kindred diseases, and has, as an expert, been frequently in the courts for the purpose of giving evidence relative to this and other medical questions. Although never having surgical aspirations, yet an operation and its result, which has always given him great pleasure, was in the case of a soldier who received a gunshot wound of the cranium, producing a comminuted fracture of the right parietal bone, at the battle of Gettysburg. Owing to a failure in elevating the fragments at the time, epileptoid convulsions supervened within two years and so frequently did they recur, that they were soon of almost daily occurrence.

In 1868 he came under Dr. Colvin's observation, and was advised to submit to an operation which he readily did. The operation was made, and the depressed bone removed, and resulted, with one exception (six weeks after), in no return of the seizures. The patient lived fifteen years, dying from some other cause. But four or five cases of gunshot wounds of the cranium, resulting in epilepsy, occurred during the rebellion (all of which were operated upon) not one of which, save this one, was successful. This case is published in the first surgical volume of the "Medical and Surgical History of the Rebellion." Dr. Colvin was appointed surgeon of the One Hundred and Seventh Regiment of the National Guard of the State of New York by its governor in 1864, and served as such until it was disbanded, a period of about four years. He has a large consulting practice in his own and adjoining counties, besides a finely selected, though intentionally limited, general practice. He has frequently acted as president of his county medical society, and is a member of the American Medical Association, and in 1887, was its second vice-president. He is a retired permanent member of the Medical Society of the State of New York and is one of the founders of the New York State Medical Association, and at one time was one of its vice-presidents and a member of its council. He has frequently contributed papers to that association and to many medical journals upon various medical subjects. At various times he has been president of his village board of education and board of health.

COMEGYS, Cornelius George, of Cincinnati, Ohio, was born at Cherburg, the family mansion, Kent county, Del., July 23, 1846. His father was governor of Delaware, 1839-42, and was a descendant of a German-Holland family that settled in Kent county, Md., in 1660. Dr. Comegys was educated in the Dover Academy, Delaware. In 1839 he married a daughter of Governor Tiffin, of Ohio. It was his plan to have entered upon the study of medicine at the usual time, but circumstances led him to Indiana, where he embarked in business, which ended unsuccessfully after several years of effort. He then went to Philadelphia, and entered upon the study of medicine as a student of Professor W. E. Horner. He graduated in the class of 1848 at the University of Pennsylvania. He began work in Philadelphia, but removed to Cincinnati in 1849, where the advent of the Asiatic cholera that year gave him the opportunity of obtaining a large practice. In 1851 he went to London and Paris for clinical study. In 1852 he was elected to the chair of anatomy in the Cincinnati College of Medicine and Surgery, and gave a course; but resigned to accept the chair of the institutes in the new Miami Medical College. In this position he remained until the fusion of that school with the Medical College of Ohio in 1857, where he occupied the same chair until 1860; then, with several of his colleagues, he resigned. In 1864 he was re-elected, and held also the additional title of Professor of Clinical Medicine. Ill-health led him to resign again in 1868. The chief feature of his relationship to both these schools was the leadership in the establishment of a college dispensary for the advantage of college clinics, after the manner of those in the Philadelphia schools. He became connected

with the Cincinnati Hospital in 1857, and has been a lecturer on clinical medicine and president of the staff. It was through his recommendation that the board of trustees established the department of pathology separate from the clinical service. His chief literary work is the translation from the French of the widely known "History of Medicine," by Renouard. He is the author of numerous papers in the medical press, two of which have attracted much attention: one, "On the Pathology and Treatment of Phthisis," 1854, referred to in the American edition of "Watson's Practice," and in Copeland's Dictionary," American edition; the other, "On Cool Bathing in the Treatment of (Infantile) Enterocolitis," *Philadelphia Medical Times*, July, 1875; of which Professor H. C. Woods says, in 1877, after having practiced it extensively during the hot term of 1876, "It must be granted to Dr. Comegys the credit of having introduced one of the most life-saving improvements in modern therapeutics." Dr. Comegys believes himself to have been the first to have announced the correct theory of counter-irritation in therapeutics. His views on this subject are to be found in the "Treatment of Asiatic Cholera," *American Journal of Medicine*, 1866; and "Reports of Cases of Brain Tumors," *Philadelphia Medical and Surgical Reporter*, 1870. His address before the Alumni Association of the University of Pennsylvania in 1875 has attracted large attention outside the profession by reason of his discussion that "A Healthy Brain is Necessary to a Free Will." In the same lecture is found a glowing eulogy on the distinguished career of the venerable Professor George B. Wood, and which drew from that eminent man a letter of acknowledgment. His earnest plea also for a "Reform in Medical Teaching" exerted much influence in effecting the change in the course now pursued in the university. Dr. Comegys also produced a new specialty, the "Practice at the Bar" of legal medicine by physicians themselves; also a more comprehensive journalism as a present need of the average physician. As a member of the staff of the hospital he has been a steady advocate of the necessity of giving bed-side instruction to advanced students in the wards; and that students should be required to pass in clinical examination in order to graduate. He thinks that instruction offered to large classes in amphitheaters is wholly inadequate. He has been largely interested in public education, and has for twenty years past been a director in the board of education, or university board. As chairman of the library committee in 1857, he developed what now constitutes the great Public Library of Cincinnati. He entered the municipal legislature in 1859, and secured the organization of the University of Cincinnati, and is now president of its board of trustees. He is one of the founders of the Cincinnati Academy of Medicine, and has served as president; also of Cincinnati Medical Society, of which he has been president. He is an associate member of the Philadelphia College of Physicians, and permanent member of the American Medical Association. At the Detroit meeting of the organization in 1892, and at Milwaukee in 1893, Dr. Comegys, as chairman of a special committee to petition Congress to create a department, and secretary of public health, reported hopeful progress in securing the establishment

of this much-needed legislation, so well calculated to promote in a large way the public welfare.

CONNER, Phineas Sanborn, of Cincinnati, O., son of the late Dr. P. S. Conner, was born in West Chester, Pa., August 23, 1839. He was educated at the Hughes High School, Cincinnati, and at Dartmouth College, New Hampshire, from which he received the degree of A. B. in 1859. He then studied medicine in the Jefferson Medical College, Philadelphia, where he received the degree of M. D. in 1861. He entered the United States Army the same year, and held the position of assistant surgeon with the rank of brevet captain and brevet major. He established himself at Cincinnati in 1866, and was elected Professor of Surgery in the Cincinnati College of Medicine and Surgery. Since 1867 he has been connected with the Medical College of Ohio, holding now the chair of Surgery, and since 1878 has held the chair of Surgery in the Dartmouth Medical College, New Hampshire. He is Surgeon to the Cincinnati and Good Samaritan Hospitals. He is a member of various medical societies, national and local, and has been president of the American Surgical Association, of the American Academy of Medicine, of the Ohio State Medical Society, and of the Cincinnati Academy of Medicine.

CONNOR, Leartus, of Detroit, Michigan, was born in Coldenham, Orange county, New York, January 29, 1843. His mother was Caroline Corwin, sixth in descent from Matthias Corwin, who emigrated from England and settled in Ipswich, Massachusetts, in 1633. His father was Hezekial Connor, third in descent from William Connor, who emigrated from Castle Pollard, county of West Meath, Ireland, and settled in Scotchtown, Orange county, New York, 1767. He prepared for college at Walkill Academy, in Middletown, New York, and graduated A. B., from Williams College, Massachusetts, June, 1865, and received the degree of A. M., in 1868. To complete his preparation for the study of medicine, he served as principal assistant of Mexico Academy, at Mexico, Oswego county, New York, during two years, spending the leisure from his teaching duties in the study of the geology, botany and conchology of that region. His medical preceptor was Dr. George L. Dayton, of Mexico, N. Y. He spent one year in the medical department of the University of Michigan, devoting special attention to the work in the chemical and anatomical laboratories, for which that institution was celebrated. He then spent two full years in the College of Physicians and Surgeons of New York City. The intervals between the regular courses in the college he spent in taking private courses in dispensaries and hospitals, finally graduating from the College of Physicians and Surgeons, in 1870. After spending a few months in practice at Searsville, New York, he removed to Detroit, Michigan, February, 1871, to teach chemistry and conduct the chemical laboratory in the Detroit Medical College, and to engage in the practice of medicine. His interest in ophthalmology and otology was awakened by the didactic and clinical instruction of the late Dr. C. R. Agnew and Dr. Herman Knapp, of New York, and increased by the cases that came under his care in general practice. These cases became so numerous that, in 1878, he

Leartes Connor

was compelled to abandon all general practice and devote himself exclusively to their management. From 1871 to 1881, he taught continuously in the Detroit Medical College, as follows: One year chemistry, seven years physiology and clinical medicine, and two years didactic and clinical ophthalmology and otology. For several years he was secretary of the Detroit Medical College; during seven years he was secretary of the American Medical College Association. Since 1871 he has edited a medical journal, known successively as the *Detroit Review of Medicine and Pharmacy*, *Detroit Medical Journal*, *Detroit Lancet*, and now the *American Lancet*. During one year he was president of the American Medical Editors' Association. Besides the editorial writing monthly for his own journal, he has contributed papers to other medical journals, and to the transactions of many medical societies, as the Detroit Academy of Medicine, the Michigan State Medical Society, the American Academy of Medicine, the Ophthalmic Section of the American Medical Association, the Ophthalmic Section of the International Medical Congress, at its Washington meeting, etc., discussing topics connected with the affections of the eye and ear. He has been active in promoting the interests of the medical societies of which he is a member. He has served as secretary and president of the Detroit Academy of Medicine for two terms each; as vice-president of the American Academy of Medicine one year; as vice-president of the American Medical Association one year; as trustee of the *Association Journal* six years; as chairman of the Section on Ophthalmology of the American Medical Association one year. His hospital work has been constant. For six years after settling in Detroit he served as physician to St. Mary's Hospital; for twelve years he has been Ophthalmic Surgeon to Harper Hospital; for two years he has been Consulting Ophthalmic Surgeon to the Woman's Hospital; and for

four years he has been Ophthalmic and Aural Surgeon to the Children's Free Hospital.

COOVER, Eli Houser, of Harrisburg, Pa., son of Jacob and Annie Houser Coover, was born October 1, 1827, near Mechanicsburg, Cumberland county, Pa. He acquired his early education in the high school of Mechanicsburg; read medicine with Augustus Vanhoff, M. D., and was graduated in medicine from Jefferson Medical College, Philadelphia, in 1850. In April, 1850, he located in New Cumberland, Pa., where he had a lucrative practice until 1869, when he moved to Harrisburg, Pa., where he has since remained in active medical and surgical practice. As early as 1856 he removed the parotid gland successfully. In 1870 he performed the operation of resection of the forearm with perfect success. On November 22, 1871, he treated very successfully a case of strychnine poisoning with chloral hydrate and bromide of potassium (see *Scientific American*, December 16, 1871). In February, 1877, he described in *Medical and Surgical Reporter*, Philadelphia, his concavo flexion splint for the treatment of Barton's fracture (see Agnew's Surgery). Some time before this he had invented the concavo extension splint. He contributed to the same journal in 1878 an article on spinal diseases and spinal curvatures, and their treatment by the use of his close-fitting, self-adjusting silicated soda spinal jacket or corset, which invention has been very successful in the treatment of spinal diseases by him. The jacket was presented before the American Medical Association in New York, June, 1880. He was one of the originators of the Cumberland County (Pa.) Medical Society, and in 1870 became a member of the Dauphin County (Pa.)

E. H. Coover

Medical Society by certificate; he is a member of the State Medical Society and of the American Medical Association. He filled the posi-

tion of Northern Central Railroad surgeon from 1851 to 1869. He was a United States examining surgeon for pensions from 1872 to 1883; president of Dauphin County Medical Society in 1883. He has two sons, both physicians: David H. Coover, specialist of the eye and ear in Denver, Col., and H. Ross Coover, practicing in Harrisburg, Pa.

CORNETT, William T. S., of Madison, Ind., was born July 11, 1805, at Carrollton, Ky. His father died during the infancy of the subject of this sketch, after which his care devolved entirely upon his mother. He received a common school education, and was then sent to Lexington, Ky., to study the Latin and Greek languages in Transylvania University. After this course he was placed by his guardian (against his inclination) in the office of a general practitioner of medicine to acquire a knowledge of his profession. He there learned to compound drugs and fill prescriptions, a necessary part, he still thinks, of medical education. Being duly encouraged by his preceptor he resolved on success if possible, and became a diligent student for about three years. He then returned to the university and attended one full course of lectures in its medical department in the winter of 1823-24. The members of the faculty at that time were: Dudley, Caldwell, Brown, Drake, Richardson, Blythe and Best. At the end of this course he found himself nineteen years of age and his means exhausted. He was consequently compelled to seek a location and offer his medical services to the public. On reaching Dearborn county, Indiana, where he temporarily located, he was informed that the law of the State made it an indictable offense for any one to practice medicine without first being examined and licensed. Each judicial district constituted a medical district and the district society had three censors, whose duty it was to examine applicants and if found qualified, they would give a permit to practice until the next meeting of the society, when the case would be finally acted upon. He passed a satisfactory examination, one of the censors being a Scotchman and a graduate of the University of Edinburgh. At the next meeting of the district society the censors reported him qualified and a diploma was granted, signed by the president, secretary, and censors, and stamped with the seal of the society. He still has this diploma in a tin box, lying between two college diplomas of a later date, conferring upon him the degree of M. D. He was chosen a delegate to represent the district society at the next meeting of the State society at Indianapolis in 1825. At this meeting there were few in attendance outside of that city. The president, Dr. Samuel Grant Mitchell, read his address, but no papers were read by the members. Dr. Cornett had a paper in his pocket, but finding that no one else had, made no mention of it. At the next meeting of the legislature the law regulating the practice of medicine in his State was repealed in order to give the people a chance to employ "steam doctors." This was the last meeting of the original Indiana State Medical Society, and as far as known Dr. Cornett is the only man now living who was a member of it. On his return he made an abridgment of his paper and sent it to Dr. Drake at Cincinnati, who was then editing the *Western Journal of Medical and Physical Sciences*. His paper found a place in

the journal and in consideration of it he was complimented with a year's subscription (\$5.00) which he regarded as an invitation to become a contributor to its pages. On locating at Versailles, Ripley county, Ind., in the spring of 1825, he met a competitor, who soon left, and he then became the only physician in the county for a period of three years, and was compelled (single handed and alone) to assume all the responsibilities in the practice of medicine, surgery, and obstetrics. This he regarded as a great advantage, as it taught him self-reliance. During the years of his pupilage and early practice medical books were scarce. The doctor is quoted as saying: "On practice we had Cullen and Thomas, the latter was regarded as the best. He did not commit Thomas to memory as Dr. Physick did Cullen, but he went over it so often and so studiously that he knew thoroughly its contents, and when he settled the diagnosis in a case he knew at once how Dr. Thomas would treat it if present. He thinks a half a dozen books to examine on a case would have caused confusion and hesitancy. In obstetrics he was also thorough in James Merriman. Ripley is a large county, it was heavily timbered, and its early settlements chiefly in the valleys of its water-courses. The principal diseases during summer and autumn were cholera morbus, dysentery, summer complaint of children, remittent and intermittent fever. Most writers think the last two diseases have one and the same cause, viz: "Malaria, a convenient peg on which to hang our ignorance," but in Cornett's opinion these diseases are specifically different, as much so as small-pox and measles, and that such is caused by a specific living germ though found as neighbors in the same locality. He states that before the days of quinine, chronic intermittents were common, lasting six months or even a year, and that remittent fever destroyed the patient or subsided within a given time and holds that if there be a unity of cause there should be a unity of effect. At the beginning and during the early years of his professional life, blood-letting was practiced in most inflammatory diseases and in some which were not inflammatory. This practice became unpopular from its abuse and was abandoned. It is now styled the "lost art" in therapeutics. Those who had written books and lectures in its favor then imagined that a change of type in disease in general had occurred, and as a consequence there was no further use for the lancet, but Dr. Cornett was not convinced of the soundness of this view and never expects to be. He writes that he has used the lancet to remove blood pressure from the brain in every case of puerperal convulsions that he has ever seen, either in his own practice or in the practice of others when called in council and that they have all recovered and says that the result is no doubt exceptional, but it has impressed him with the belief that the practice was not injurious." In a recent number of a St. Louis medical journal there is a paper in which the writer claims eight consecutive recoveries from this affection, the treatment being morphine hypodermically used. These apparent opposites are calculated to make us ask ourselves the question, what is medical experience worth? The *rationale* of this is explained by Dr. Cornett as follows: "A moderate dose of opium is a stimulant and does injury by increasing blood pressure, whilst a larger dose

weakens the force of the circulation and consequently lessens blood pressure. Thus these two modes may tend to the same result." His contributions to medical literature have been on a variety of subjects and have been published in the Transactions of the Indiana State Medical Society and in the leading medical journals of the South and West. Dr. Cornett represented the county of Ripley for six years in the State Senate of Indiana, beginning in 1841. At the session of 1843-44 when the revenue bill of the house was reported to the senate he moved to amend said bill so that an additional one cent on the hundred dollars be levied as a fund with which to build a lunatic asylum. This amendment was carried in the senate and the house concurred in the amendment. With this fund a farm was purchased near Indianapolis, and on it the first hospital for the insane erected. This property is said now to be worth a million and a half dollars. (For the truth of this statement see Senate Journal 1843-44, page 521.) The history of the origin and progress of this institution has been written and published more than once without the mention of the name of Dr. Cornett in connection with it. The above injustice is therefore a sufficient apology for including the subject in this sketch. Dr. Cornett received the degree of Doctor of Medicine from the University of Louisville and also from the Central Medical College of Indiana in 1852. He practiced medicine at Versailles, Ind., for forty years. In 1867 he removed to the city of his present residence and retired from professional life.

CORSON, Hiram, of Plymouth Meeting, Pa., son of Joseph Corson and Hannah Dickinson Corson, was born October 8, 1804, in Montgomery county, Pennsylvania. His father was of Huguenot descent, his first American ancestors being Cornelius Corson, who came from France and settled on Staten Island when the Huguenots were fleeing in all directions from the persecution of Louis XIV prior to 1680. His mother was of English descent, her ancestry running back two hundred and fifty years in Virginia, Maryland and Pennsylvania, to Charles Dickinson, a merchant of London, whose father was Gentleman Usher of the Scarlet Rod, Order of Bath, in the court of James I, and who was himself a direct descendant of Edward III. The Dickinsons were among the first converts to Quakerism through the direct agency of George Fox himself, who visited them both in England and after their arrival in this country. It was no doubt the influence of his religious views which induced William Dickinson to move, as early as 1680, to Penn's Colony, where many of his descendants still remain. Mr. Wharton Dickinson—a descendant of Governor Dickinson of Pennsylvania—runs back the Dickinson line, through official papers, from Charles of London to Ivar of Norway, A. D. 700. Dr. Corson, after having received his plain and moderate education in the schools of Friends at Plymouth Meeting and in Philadelphia, studied medicine with Dr. Richard D. Corson, of New Hope, Pa., March 9, 1826, and graduated M. D. in the University of Pennsylvania, March 27, 1828. He began to practice in the same year at Plymouth Meeting, where he has ever since remained. At that time cold water was rarely used as drink for sick people in any disease. In measles and other cutaneous diseases it was

denounced as positively dangerous. Hot teas were in universal use in all diseases. Dr. Corson resolved never to use them in any febrile disease if they were not craved by the patient; and at once, in 1829, when the measles appeared, gave freely of cold water, not only to allay the craving thirst for it, that is always present in that disease, but also as a remedial measure to reduce the high temperature. This plan of treatment was before that time an unheard-of one, and was condemned by the profession everywhere. In 1830 he began the treatment of scarlet fever in the same way, and by sponging the surface of the body with cold water when the heat was great, and also by having pieces of ice held in the mouth to cool it and the swelled tonsils. This treatment was severely criticised and denounced, but it proved so successful that in his sixty years of practice it was continued; and, in

Hiram Corson

measles, he can say that under this cooling treatment not one patient was lost. To the use of ice in the mouth, cold water as drink, and cool sponging of the body, with copious affusions of cold water on the head when the brain, in scarlet fever, was affected, he added, in 1844, the external application of ice to the inflamed sub-maxillary glands; and, from that time to the present, has regarded this treatment of scarlet fever as the most successful known to the profession, and by far the most agreeable to the patients and the nurses. His contributions to the literature of the profession were numerous. Papers on measles in 1844 and 1872; on scarlet fever because of the persistent opposition to this mode of treatment—termed by his critics the freezing treatment—and because of the too-fatal modes of various kinds in common use he wrote frequently,

that others might be led to try his measures. Papers on this subject—treatment of scarlet fever—may be found in Transactions of the Pennsylvania Medical Society of 1857, 1862, 1864, 1867, 1871, 1872 and 1876; and in *Medical and Surgical Reporter* of Philadelphia, in 1871, 1873, 1876 and 1882. These papers were efficient in causing many of the profession to adopt the measures and bear testimony to the value of the reform. Among other papers are those entitled "Epidemic Jaundice;" "Belladonna in Whooping-cough;" "Ice as a Remedy for Inflammation of Mammary Glands;" "Reminiscences of the Asiatic Cholera of 1832;" "Puerperal Convulsions;" "Thoughts on Midwifery;" "Meddlesome Midwifery;" "Midwifery in the Country;" "Three Thousand and Thirty-three Cases of Midwifery;" "Food for Infants," an advocacy for undiluted milk, as against the starving dilution which has slain its thousands; the "Use of Opium in Obstetrics;" "Sulphate Quinine as an Antipyretic in Pneumonia," denying its value; "Ice in Glossitis, Peritonitis and Typhilitis," locally applied; "Cimicifuga a Remedy for Chorea;" "Rhus Glabrum in Stomatitis;" "Hydrophobia;" "The Use of Stimulants by the Profession;" "Diphtheria Treated by Ice Externally and Internally; four papers in 1881 on "Blood-letting in Pneumonia," "Blood-letting in the Old," "Blood-letting in the Young," "Blood-letting in Inflammatory Diseases;" "Pneumonia," a review in four papers in 1890; "Pneumonia, its Unsuccessful Treatment by Arterial Sedatives and its Successful Treatment by Blood-letting," read before the Philadelphia County Medical Society, by request, in April, 1892, and discussed by its members; "How Shall We Conduct a Labor?" "Cold as a Remedy in Febrile Affections"—read before the Ninth International Medical Congress; "Scarlet Fever in a Puerperal Patient," subdued by the cold treatment; and "Cerebro Spinal Meningitis." Important as some of these papers were, especially those showing the value of the cooling treatment in measles and scarlet fever, diphtheria and local inflammations, and of the safety and value of blood-letting in pneumonia and other inflammations, his greater work was begun when in his fifty-sixth year, when he was pressed by a large and laborious country practice. Then, in the face of almost universal opposition by the profession, he began his efforts for the recognition of women physicians by the profession. After continuous efforts in the meetings of the State Medical Society, year after year, this was accomplished in 1871, and women physicians became fully recognized by the profession in the State. But this was only preparatory to the yet more important work of his advanced age. In 1877, when seventy-three years old, he brought before the State Medical Society a resolution for the appointment of a committee to "report on the propriety of having female physicians to have the care of the insane of their sex." The resolution was adopted; the committee appointed; he was made chairman, and in a little more than two years from that time—in 1879—though strongly opposed before the legislature by superintendents of the State hospitals for the insane and their medical aids, a law was enacted authorizing boards of trustees of these hospitals to appoint women physicians to have medical care of the female in-

sane. This was the beginning of a reform which has since spread over the whole country, and in Massachusetts, New York and some other States imperative law compels trustees to appoint female physicians to have entire charge of the female insane. The result of this movement is indeed wonderful. In the Norristown Hospital, where Dr. Alice Bennett has entire control of the female insane, there are now 1,002 female patients. Many honors have been conferred upon Dr. Corson during his long professional career. He became an honorary member Philadelphia Medical Society in 1828. He was founder of Montgomery County Medical Society in 1847, and president of it in 1849. He was elected member of the Pennsylvania Medical Society in 1849, and president of his State Medical Society in 1852; elected corresponding member Page Literary Society at Millersville Normal School, 1858; member American Medical Association, 1862; elected corresponding member "Meigs and Mason Academy of Medicine," at Middleport, O., 1873; associate member Philadelphia Obstetric Society, 1874; associate fellow Philadelphia College of Physicians, 1876; honorary member Harrisburg Pathological Society, 1881; life member in Alumni Association of University of Pennsylvania (and now one of its vice-presidents), 1879; elected member "Historical Society of Pennsylvania," 1884; member board of trustees of Lunatic Hospital at Harrisburg, Pa., from 1877 to 1884; appointed official visitor, by Board of Public Charities, to Montgomery county jail and alms-house, and later to the hospital for the insane at Norristown, Pa., but after service of several years declined the latter appointment and resigned the former one, because of advanced age, in 1893, and was elected honorary member American Association of Obstetricians and Gynecologists in 1892. In 1888, after having been in continuous practice for sixty years, he retired from the active duties of a profession for the advancement and honor of which he still labors.

CORTELYOU, Peter R., of Marietta, Ga., was born February 11, 1843, at Brooklyn, N. Y. He is a son of the late Adrian V. Cortelyou, one of the earlier settlers of Brooklyn, being of French-Hugenot descent, on his father's, and English on his mother's side. His early education was had at private schools, and he graduated at Yale University in 1864. He then studied medicine in Bellevue Hospital Medical College, New York, and graduated in 1867. He was a private pupil in the office of the late Professor James R. Wood, of New York. He obtained the first appointment on the staff of Bellevue Hospital where he remained one year and one-half. He then entered private practice in Brooklyn, N. Y., where he was appointed visiting physician to The Brooklyn Orphan Asylum, and to St. John's Hospital, and to the Chair of Throat and Lungs in Demilt Dispensary. He secured a good practice, but was obliged to leave Brooklyn on account of pulmonary trouble. He came to Georgia and in 1879 located in Marietta, where, after recovering his health, he again commenced practice. He is a permanent member The American Medical Association, and The Georgia State Medical Association, and in the latter has held the office of vice-president. For some years he gave lectures on physiology to the schools in Marietta. He has gained some

local reputation in the treatment of diseases of the throat, lungs and nasal organs, although doing a general practice.

COXE, John Redman, of Philadelphia, was born in Trenton, N. J., in 1773, and died in the former city, March 22, 1864. He was educated in Philadelphia, under the charge of his grandfather, Dr. Redman, until his tenth year, when he went to England, and remained until his seventeenth year. In Edinburgh he completed his classical education, and attended a course of medical lectures at the university of that city. In 1790 he returned to America, and after studying medicine regularly with Dr. Rush, graduated at the University of Pennsylvania, in 1794. The subject of his thesis was "Inflammation." He witnessed the epidemic yellow fever of 1793, while a student of medicine. After graduation, Dr. Coxe again visited Europe, and remained a pupil of the London Hospital for one year; he subsequently studied in Edinburgh and Paris, and returned to Philadelphia in 1796. In 1797, Dr. Coxe served as one of the resident physicians of Bush Hill Hospital, under the charge of Drs. Physick and Cathrall, when, as Dr. Bell informs us, there were only twenty-three or twenty-four physicians who remained at their posts during this epidemic of yellow fever, and eight of their number died. Dr. Coxe was appointed, by the board of health, physician of the port, in 1798, the period of another great visitation of yellow fever. He was likewise, for several years, physician of the Philadelphia Dispensary, and of the Pennsylvania Hospital. He was, at the commencement of the present century, an earnest, enthusiastic advocate of vaccination. After vaccinating his oldest child, then an infant, at the time the full efficacy of the practice was still in suspense in the public mind, he fully tested it by exposing him to the influence of small-pox. The result of this, then bold experiment, contributed in no small degree to establish reliance on the protective power of vaccination. Dr. Coxe succeeded Dr. Woodhouse in the chair of chemistry in the University of Pennsylvania, in 1809, and was transferred to that of *materia medica* and pharmacy, in 1819, which he held until 1835. He was possessed of considerable classical attainments, and was well versed in the ancient literature of medicine. The doctrines and opinions of the earlier fathers of physic had so superior a value in his estimation as to lead to too exclusive an exposition of them in his lectures. This was more particularly the case when occupying the chair of *materia medica* and pharmacy; but the merit is due him of opposing the extended assumption of the doctrines of solidism that prevailed, and of giving proper significance to the facts of the humoral physiology and pathology, which were gaining ground from the commencement of the present century, and are now fully admitted. He insisted upon the correctness of the doctrine of the absorption of medicinal substances, and upon the explanation, by it, of their *modus operandi*. He published a treatise on "Inflammation," 1794; and on "Vaccination," 1800. Dr. Coxe at one time was the editor of the *Medical Museum*. This periodical was commenced in 1804; the same year as the publication of Dr. Barton, and was continued regularly until 1811. It may be said to be the first uniformly issued periodical in the city of Philadelphia, but not in the United States, as, in this respect,

the city of New York takes precedence. He published, as editor, the *American Dispensary*, a work largely derived from *Duncan's Edinburgh Dispensary*. In 1808 he published a Medical Dictionary. Late in life he issued an Exposition of the Works of Hippocrates, and an "Essay on the Origin of the Discovery of the Circulation of the Blood." In 1829, he introduced, and succeeded in cultivating, the true jalap plant, thus enabling Mr. Nuttall to determine its real character and position. He died at the advanced age of ninety years.

CRAIK, James, of Fairfax county, Va., was born in Scotland in 1731, and died February 6, 1814. He was educated to be a surgeon in the British army, but came to Virginia early in life; accompanied Washington in the expedition against the French and Indians in 1754, and was in Braddock's disastrous campaign in 1755; attended that general after his defeat and assisted in dressing his wounds. We owe to Dr. Craik the details of Washington's remarkable escape at Braddock's defeat. While exploring the western part of Virginia in 1779, he met an aged Indian chief who told him, by an interpreter, that he had made a long journey to see Colonel Washington, at whom, in the battle of Monongehela, he had fired his rifle fifteen times, ordering all his young men to do the same. During the Revolutionary War Dr. Craik served in the medical department and rose to the first rank. He was active in disclosing the conspiracy of 1777, to remove the Commander-in-Chief, and in 1781, as director-general of the hospital at Yorktown, was present at the surrender of Cornwallis. After the war he removed to the neighborhood of Mount Vernon at Washington's request, and attended him in his last illness. Washington spoke of him as, "My compatriot in arms, my old and intimate friend."

CRANDALL, William Wells, of Wellsville, N. Y., was born in Genesee Allegany county, N. Y., March 23, 1828. He was the youngest son of Ezekiel and Susan Wells Crandall, natives of Hopkinton, R. I., and of English descent. His father held a major's commission in the war of 1812, serving with honor in the defenses of Rhode Island and Connecticut. Dr. Crandall was educated at Alfred Academy, and Bown University, was granted a "Teacher's State Certificate," by Victor M. Rice, State Superintendent of Public Instruction of New York, and taught several years in the public schools of New York and Rhode Island. He began the study of medicine with H. P. Saunders, M. D., of Alfred Centre, N. Y., in 1855, but at the end of the first year went to New York for the greater opportunities of hospital and clinical study, where he remained till graduated from "The University of the City of New York," March 6, 1858, the faculty granting him, additional to the regular diploma, a "Certificate of Honor," as an evidence of his having pursued a fuller course of medical instruction than usually followed by students. He was also graduated from the "New York Ophthalmic Hospital." Immediately after he went abroad, studying in London and Guy's Hospitals, the former under the celebrated Dr. Curling. Returning to this country he settled in Andover, N. Y., succeeding to the patronage of J. J. Harmon, M. D.; after six years successful practice he returned to New York and pursued special studies with Professors Austin Flint, Sr., in diseases of the chest, Austin

William W. Crandall.

Flint, Jr., in microscopy and urinary diseases, and Stephen Smith, in operative surgery. He also took a course in the Post-Graduate School of New York in 1884. Dr. Crandall was elected member of assembly for Allegany county in the State Legislature of 1872, re-elected in 1873, serving on the committees of "Public Education," and "Public Health," being chairman of the latter, in which capacity he was instrumental in initiating several important measures. He has been a member of the Elmira Academy of Medicine, Hornellsville Academy of Medicine, twice president of the latter, President of Allegany County Medical Society, permanent member of the New York State Medical Society since 1881, and vice-president of that society in 1891; also representative delegate for Allegany County Medical Society and to the Pan-American Medical Congress, and member of its Auxiliary Committee, Washington, D. C., 1893.

CROSBY, Alpheus Benning, of New York City, was born February 22, 1832, at Gilman-town, N. H., and died in Hanover, N. H., August 9, 1877. He is the son of Dixie Crosby, M. D., LL. D., and the grandson of Asa Crosby, M. D. His family has resided in this country since the settlement of New England by the Puritans, and has included among its members no less than sixteen physicians. Receiving his preliminary training at Moor's Charity School, he entered Dartmouth College, graduating therefrom in 1853, and from the medical department of the same institution in 1856. Locating at Hanover, N. H., in 1856, he the same year became Demonstrator of Pathological Anatomy at Dartmouth College, Adjunct Professor of Surgery in 1862 at Dartmouth College; Professor of Surgery, Dartmouth College 1866; Professor of Surgery, University of Vermont, 1865; lecturer on surgery at the medical school of Bowdoin College, 1868; professor of surgery, University of Michigan,

1869; professor of surgery, Long Island College Hospital, 1871; and professor of anatomy, Bellevue Hospital Medical College, 1872. Among the societies of which he was a member are the New Hampshire State Medical Society, serving as president, 1876; Vermont State Medical Society; Connecticut River Valley Medical Society; White Mountain Medical Society; Washtenau County (Mich.) Medical Society; Kings County (N. Y.) Medical Society; Queens County (N. Y.) Medical Society, honorary member; New York Pathological Society; New York County Medical Society; New York Medical Journal Association; New York Public Health Association, and the American Medical Association. In June, 1877, he presided at the annual meeting of the New Hampshire Medical Society and delivered an address upon, "The Ethical Relations of Physician and Patient." Included in his contributions to literature, the most important are "A Month in a Volunteer Camp;" "Foreign Bodies in the Knee-Joint, with an Account of Seven Successful Operations for their Removal;" "A Successful Case of Ovariectomy;" "A Series of Papers on Abscess;" "A Case of Siamese Twins, with an Operation for Vesico-vaginal Fistula;" "A Case of Ovariectomy;" "An Essay on Pain;" "Gunshot Injuries of the Knee-Joint, Requiring Amputation;" "A Contribution to the Medical History of New Hampshire;" "An Address Commemorative of Prof. Reuben Dimond Mussay, M. D., LL. D.;" "An Eulogy on Nathan Lord, D. D., President of Dartmouth College;" "An Address Commemorative of Prof. David S. Conant, M. D.;" "Enthusiasm the Condition of Professional Suc-

A. B. Crosby.

cess;" "Septicemia;" "The First Operation on Record for the Removal of the whole Arm, Scapula and three-fourths of the Clavicle;" "A Lost

Art in Surgery;" "General Considerations in Regard to Fractures;" and "Common Sense in the Sick-Room." During the late Civil War he served as surgeon of the First Regiment New Hampshire Volunteers; as brigade and division surgeon on the staff of Gen. Stone, and as medical director on the staffs of Gen'l's Sedgewick, Casey and Peck. He has also been attached as assistant surgeon to United States Marine Hospital, Boston, and as surgeon of the University Hospital, Michigan; Long Island College Hospital and Bellevue Hospital. At the beginning of the Civil War Dr. Crosby joined the First New Hampshire Volunteers as surgeon, and was afterwards promoted as brigade surgeon, but in 1862 he resigned to become associate professor of surgery to his father, who was professor of surgery and anatomy in Dartmouth, and after succeeding his father, he retained this chair as well as those in the other schools mentioned until his death.

CROSBY, George Avery, of Manchester, N. H., was born in Lowell, Mass., December 27, 1831, and died January 30, 1888. He came from a family of eminent physicians and surgeons, and was graduated from the academic department of Dartmouth in 1852, and from the medical department of the same institution in 1855. Two years later he went to Peru and practiced there seven years. In 1864 he returned to the United States and established himself at Manchester, where he was engaged in the general practice of his profession for over twenty years. He was president of the New Hampshire State Medical Society in 1886, spent the following year in hospital on Deer Island and in New York City, and was a member of the Manchester Board of Health at the time of his death.

CULVER, Joseph Edwin, of Jersey City, N. J., a descendant of early English settlers in Connecticut, was born in Groton, New London county, in that State, February 9, 1823. His early education was obtained in the schools of his native place, with only the additional aid of two summer courses—1839–40—passed at the Connecticut Literary Institution at Suffield. In the winter of 1839 he took charge of a public school in Groton; still pursuing his studies privately. His chief and most successful studies were of mathematics and natural sciences, and when he determined to enter the medical profession, he had a knowledge of electricity, galvanism, optics, acoustics, chemistry, physiology, anatomy, materia medica, toxicology and hygiene. He entered Berkshire Medical College in 1847, and subsequently the medical and surgical school of Dr. John H. Whittaker, of New York, and the surgical school of Dr. William Detmold. He also studied at the College of Physicians and Surgeons in New York City, graduating thence M. D. in 1849. After graduating he located himself in that part of North Bergen township which was subsequently incorporated as Hudson City, and is now included in Jersey City. He was, in 1850–51, a member of the Passaic District Medical Society. He is a member of the District Medical Society of the County of Hudson, was its organizer in 1851, has held every office in its gift, including that of historian and custodian of its archives; of the State Medical Society, on its standing committee in 1871–72–73; charter member of the New Jersey Academy of Medicine, its vice-president and chairman of committee of admissions; one of the

founders of the Jersey City Pathological Society, and its first president; and is also at the present time a member of the New York Pathological and Neurological Societies. His contributions to medical literature have been various, among them "Documentary History of Dissensions in the Hudson County Medical Society," published in 1873; "Case of Choleraic Dysentery," 1868; "On the Hygrometer," 1876; "A Case of Hydrophobia;" also the author of a paper on "Certain Physiological Relations and Uses of the Oxides and Oxy-salts of Iron" (his graduation thesis); on "Digestion;" "Origin and Relations of Urea, Uric Acid, and Uric Oxide;" "Pepsin;" "On Putrefaction;" "Effects of Oxide of Zinc upon its Makers and Users," and "Researches Concerning the Pigment of Jaundice," and the "Method of Testing for Bile Pigments in Urine and other Liquids." He was, in 1849, chosen physician of Bergen and North Bergen township, and county physician of Hudson county, which positions he filled for many years; he has been on the staff of St. Francis Hospital since its organization. He has been city superintendent of schools of Hudson City, wrote their rules and regulations and devised the system of school management, pronounced by the State superintendent the best in the State; in 1860 he became treasurer of Hudson City, a position he held eight years; and he is a trustee of Hudson City Savings Bank. He wrote its by-laws and devised its system of management; also, with Dr. T. R. Varick in 1860, established the Hudson County Hospital, which was legislated to death by the surreptitious passage of an amendment to its charter, authorizing the appointment of irregular practitioners on the hospital staff. In 1869–70, he invented and patented, in this country and Great Britain, improvements in steam-engines and in motive power engines; has for twenty-five years used adhesive plaster in strips to arrest the deformity of talipes; and in 1875 demonstrated that human bile and the bile of some animals contain ferrocyanides, and that these ferrocyanogen constituents are essential to the color of the bile; and that the color and chemical reactions of indican, in human urine, are identically those of the ferrocyanide of iron.

CURTIN, Roland Gideon, of Philadelphia, was born October 29, 1839, at Bellefonte, Pa. His father, Dr. Constans Curtin, who practiced medicine in Center county for over a third of a century, was born in Dysart, County Clare, Ireland, and emigrated to this country in 1807. He was an uncle of ex-Governor Andrew G. Curtin. His mother was Mary Anne Kinne, whose ancestors, originally from England, lived in Massachusetts and Connecticut for six generations. Her grandfather, the Rev. Aaron Kinne, was chaplain at Fort Griswold, Groton, Conn., when on Sept. 6, 1781, the British under Benedict Arnold massacred Col. Ledyard and his garrison. Dr. Curtin received his early education in the public schools and Bellefonte Academy, afterwards entering the Scientific department of Williston Seminary, East Hampton, Mass., and was graduated in 1859. After being in the iron business for a year, he was appointed United States Naval Storekeeper, and was stationed at the Philadelphia navy yard, which position he held until the close of the Rebellion. During this period he studied medicine at the University of Pennsylvania

nia, and was graduated from that institution in 1866, having had as his preceptors Drs. J. J. Levick, William Hunt and R. A. F. Penrose. In 1872 he received from the University of Pennsylvania the degree of Ph. D., and in 1882 Lafayette College conferred upon him the honorary degree of A. M. After graduation he was appointed resident physician in the Philadelphia Hospital, where he served for eighteen months, after which he traveled in Europe for a year for the purpose of visiting the principal hospitals of Great Britain and the continent. In 1868 he was appointed assistant U. S. Geologist and under Prof. F. V. Hayden made an extended tour of the Rocky Mountain region. In 1869 he settled permanently in Philadelphia and began the practice of medicine, in which he has been eminently successful to the present time. In 1876 Dr. Curtin was appointed

Roland G. Curtin

assistant medical director of the Centennial International Exhibition, and he has held also the following positions: Professor of geology and mineralogy in the Wagner Free Institute, 1871-72; professor of geology at George Institute, Philadelphia; assistant physician at the Lying-in-Charity from 1871 to 1882, assistant to professor of clinical medicine, University of Pennsylvania, 1875, and lecturer on physical diagnosis at the same since 1877; physician of throat and chest department Howard Hospital from 1876 to 1882; visiting physician to Maternity Hospital for seven years; visiting physician to the Hospital of the University of Pennsylvania since 1879, visiting physician to the Philadelphia and Presbyterian Hospitals, consulting physician to the Rush Hospital for Consumptives, St. Timothy's Hospital and the Midnight Mission. Dr. Curtin was elected a member of the Academy of Natural Sciences in

1871, a member of the Obstetrical Society of Philadelphia in 1870, fellow of the College of Physicians in 1884, member of the American Medical Association in 1872, of the Pathological Society of Philadelphia in 1871 and its treasurer in 1879-80, member of the International Medical Congress in 1876 and one of its vice-presidents in 1887, member of the Philadelphia County Medical Society in 1878, member of the Medical Society of the State of Pennsylvania, member of the American Climatological Association, its vice-president in 1886 and has been on its council since 1887 and its president in 1892, president of local branch Philadelphia Alumni Association of University of Pennsylvania, president of Association of Hospital of Physicians and Surgeons of Philadelphia, president medical board Philadelphia Hospital, 1890. Among Dr. Curtin's contributions to medical literature are "Sulphuric Acid as a Prophylactic in Cholera," "Nervous Shock as a cause of Pernicious Anæmia," "Rocky Mountain Fever," "Influence of Sea Air in Syphilitic Phthisis," "Is Climate an Etiological Factor in Graves' Disease," "Is Hepes Zoster a Cause of Pleurisy and Peritonitis," with Dr. Edward Watson several papers on the Epidemic of Influenza of 1889 to 1892 and with Drs. D. Hayes Agnew, Alfred Stille, L. P. Bush, and Chas. K. Mills a History of the Philadelphia Hospital, 1890; articles on "Relapsing Fevers in Kealing's Encyclopedia of the Diseases of Children," "Suggestions as to the Prevention, Recognition and Treatment of Cholera," and "Oil of Sandal Wood as a Remedy for Cough." Dr. Curtin has identified himself with a number of organizations not connected with his profession, among which are Society of Sons of American Revolution, Historical Society of Pennsylvania, Fairmount Park Association, Post 2 Grand Army of the Republic, the Masonic Fraternity, being Past Master of his Lodge, a Knight Templar and a member of the Scottish Rite (Thirty-second degree), and of the Civil Service Board of the city of Philadelphia. On March 21, 1882, Dr. Curtin married his cousin Julia Robinson, nee Taylor, daughter of the late Edwin Taylor, of Hartford, Conn. They have had two children, Roland Gideon Curtin and Mary Kinne Curtin.

CURTIS, Frederick C., of Albany, N. Y., was born in Unionville, S. C., October 19, 1843. He is of English descent, and was educated at Beloit College and studied medicine in the medical department of the University of Michigan and at the College of Physicians and Surgeons of New York City, from which institution he was graduated in 1870. His medical training was also supplemented by attendance at the University of Vienna. During the rebellion he served for a few months with the Fortieth Wisconsin Volunteers. After graduating he spent some time in Europe, and in the line of his profession turned his attention to general medicine, but with special reference to dermatology. He settled in Albany on his return to this country, where he has been engaged in active professional pursuits ever since. He is a member of the various medical societies and has made valuable contributions to medical journals. He formerly held the position of Health Physician for the city of Albany.

CURTIS, John Henry, of Chicago, Ill., was born in Hawley, Wayne county, Pa., July 10, 1864. His ancestry were of the Puritan stock of Connecticut. His preliminary education

was received at Hawley public schools and academy. His medical preceptor was his father, Dr. Geo. B. Curtis. He was graduated in medicine at the University of the City of New York in 1886, and his medical education was supplemented in the private classes of Prof. Wm. Thompson and A. L. Loomis, after which he practiced his profession three years at Hawley, Pa. In 1889 he located in Chicago, since which time he has continued in the general practice of medicine and surgery, and has had considerable success in the treatment of diseases of the chest. In March, 1891, Dr. Curtis was elected Professor of Therapeutics in the College of Physicians and Surgeons of Chicago. In June, 1892, he was appointed visiting physician to Cook County Hospital.

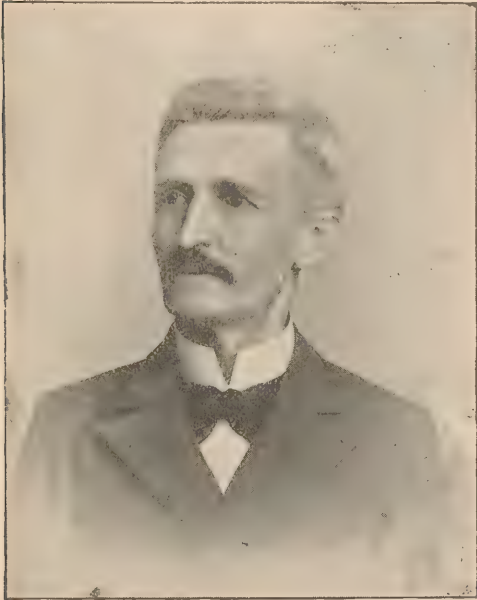

CURWEN, John, of Warren, Pa., was born September 20, 1821, in Lower Merion, Montgomery county, that State. He graduated at Yale College in 1841, and at the medical department of the University of Pennsylvania, in April, 1844. For some months before graduating at the latter institution he was a resident of Wills' Hospital, Philadelphia; but being elected, a few weeks after his graduation, assistant physician of the Pennsylvania Hospital for the Insane, he entered on duty there, June 3, 1844, and continued until October 1, 1849, from which date he had an office in Philadelphia until February 13, 1851, when he was chosen superintendent and physician-in-chief of the Pennsylvania State Lunatic Hospital, at Harrisburg. Dr. Curwen now holds the same position at Warren. He is a member of the Warren County Medical Society, of which he has been president; of the Pennsylvania State Medical Society, of which also he has been president; of the American Medical Association; of the Association of Medical Superintendents of American Institutions for the Insane, of which he was likewise secretary; and an honorary member of the American Philosophical Society of Philadelphia. He published, in 1851, a small volume, entitled, *Manual for Attendants in Hospitals for the Insane*; but, with the exception of a paper on the "Proper Treatment of the Insane," read before the American Medical Association, and published in their "Transactions," his contributions to medical literature have consisted mainly of reports of the Pennsylvania State Lunatic Hospital, memorials in behalf of the hospitals for the insane, at Danville and Warren, on some cognate topics, and reports of the commissioners of the institutions just mentioned. He was commissioner for the selection of the site and erection of State hospitals for the insane at Danville and Warren, and was trustee of the Western Pennsylvania Hospital for the Insane. He is now president of the American Medico-Psychological Association.

CUSHING, Ernest Watson, of Boston, Mass., was born in that city January 17, 1847. He is a son of Thomas and Elizabeth (Baldwin) Cushing. The family is well known in the early history of Massachusetts, to which it came in 1636 from Hingham, England. He studied in Boston and attended Harvard, where he received the degree of A. B. in 1867, and that of M. D. from the College of Physicians and Surgeons of New York in 1871. He was "Interne" in Bellevue Hospital in 1871-2, and supplemented his medical education and training by two years of study in Europe, after which he established himself in Boston, where he has practiced his profession since 1874. Dr.

Cushing was physician to the department of diseases of the throat, Boston City Hospital, from 1876 to 1884. He again visited Europe in 1885 for study, devoting his attention one year to bacteriology and especially to diseases of women and antiseptic surgery. Returning to Boston he devoted himself to special practice, and in 1886 was appointed surgeon of the Free Surgical Hospital for Women. In 1887 he founded the medical journal *Annals of Gynecology*, now the *Annals of Gynecology and Paediatrics*, of which he is editor. In 1890 he was appointed surgeon of the "Woman's Charity Club Hospital," an institution devoted especially to abdominal section; a new hospital was built in 1892, from designs by Dr. Cushing. He was secretary of Section for Gynecology of the American Medical Association in 1887, also of Section for Gynecology of the ninth International Medical Congress in the same year, and was a delegate to the tenth International Medical Congress at Berlin, in 1890 and was American secretary of Section for Obstetrics and Gynecology. He has translated and published "Pathology and Therapeutics of Diseases of Women," by A. Martin, of Berlin, with notes and appendix by Dr. Cushing, 1890. Among the valuable papers contributed to the leading periodicals of this country and of Europe may be mentioned the following: "Buccal Ulcerations of Constitutional Origin," with Dr. Wigglesworth; published in the *Archives of Dermatology*, 1882; "Religious Instruction in Public Schools," *Barnard's Journal of Education*, 1884; "Sunspots and Epidemics," *International Review*, 1885; "Specific and Infectious Nature of Tuberculosis;" "On the Examination of Sputa for Tubercle Bacilli," *Boston Medical and Surgical Journal*, 1885; "Relations of Certain Bacteria to Puerperal Inflammations," *Physicians' Magazine*, 1886; "Pathology of Ulcerations, so-called, of the Os Uteri," read before the American Medical Association, May, 1886, and published in the *Annals of Gynecology* the following year; "Case of Chronic Arsenical Poisoning of Supposed Criminal Nature," read before the Suffolk District Medical Society, Boston, 1887; "Tubal Pregnancy," rupture and recovery, *Annals of Gynecology*, 1888; "Pathology and Diagnosis of so-called Pelvic Cellulitis, with Specimens of Salpingitis;" "Diagnosis of Pelvic Tumors;" "Drainage in Abdominal Section," read before the tenth International Medical Congress, Berlin, 1890; "The Degeneration of Uterine Fibroids;" "A Case of Extra Uterine Pregnancy, Operation at the Ninth Month, Recovery;" and "Vaginal Hysterectomy for Cancer, Report of Twenty-one Cases with Nineteen Recoveries." The last two papers were published in the January and May numbers of the *Annals of Gynecology and Paediatrics* for 1891. Dr. Cushing lays no claim to special inventions or particular brilliancy of operation, but has tried to do clean surgery and has worked hard to do his part in the transformation of surgical and gynecological practice, which has taken place since 1884, by taking pains to learn what was best and newest, by diligently practicing it to the extent of his ability, and by diffusing sound teaching and correct pathology as widely as possible.

DANIEL, Ferdinand E., of Austin, Texas, a native of Virginia; was born in Greenville county, below Petersburg, July 18, 1839. His father R. W. T. Daniel was a native of Raleigh, N. C., and a descendant of the orig-

inal Daniel family of Virginia. His mother was Hester Jordan Adams, a daughter of Edwin Adams, a son of Col. Charles Adams of the Revolutionary War. Dr. Daniel's parents removed from Virginia to Mississippi in 1844, when the subject of this biography was a small child. He grew to manhood in Mississippi, receiving a good education in the schools of that State, and studied medicine at Jackson, the capital, in 1859-60; attending lectures at the New Orleans School of Medicine where the two Drs. Flint, Austin Flint Sr. and Jr., were teachers, with Fenner, Brickell, and other noted men in the faculty. Just after his first course the war came on, and although just of age, and having cast his maiden vote for 'co-operation,' *i. e.*, against secession, when it became necessary to take arms for or against his State, he volunteered in the first company of infantry that left Jackson, the "Burt Rifles,"

J. E. Daniel.

in Company K, Eighteenth Mississippi Infantry, and went to the front at Manassas, Va. Here, as orderly sergeant of his company, he participated in the first battle, "Bull-Run," and three days later, the "First Manassas." This battle was fought on his twenty second birthday. Discharged at his request, under Jeff Davis' proclamation to release all young men who were studying for a profession, he returned to New Orleans and in the fall and winter of that year, 1861-62, took a second course of lectures, and graduated from the New Orleans School of Medicine, February 2, 1862, getting out of the city just before it was captured by the Federal army under Butler. He immediately re-entered the Confederate service as acting assistant surgeon at Jackson, whence he was ordered to army head-quarters at Tupelo, Miss., to go before the army board of medical examiners for examination; passed examination and was commissioned by the war department as surgeon, with the rank of

major, and assigned to duty with Gen. Bragg. He was detailed as secretary of the board of medical examiners, of which Dr. David W. Yandell was the president. Dr. Yandell being medical director of Hardee's corps, Dr. Daniel was attached to the staff, and in the field and camp did duty as assistant medical inspector. Made the celebrated Kentucky campaign with this army, and was at the battle of Perryville, and Munfordsville. Transferred at his own request, he was assigned to hospital duty at Chattanooga, Marietta, and other points in Georgia during the years 1863-64, and in the fall of 1864 was transferred to the department of Mississippi, and was stationed at Lauderdale Springs, Miss., at the time of the surrender. The position of assistant medical director on Gen. Bragg's staff having been made vacant was tendered him in the winter of 1862-63 and declined, at the age of twenty-four years. He was the youngest full surgeon in the army. At the close of the war Dr. Daniel returned to Mississippi, like every body else in the South, much impoverished; and with a wife and one child, he having married in Mississippi, near Vicksburg, the day that city surrendered to Grant, having obtained leave of absence from his post in Chattanooga for the purpose. His wife was Minerva Patrick, a daughter of Hon. Robert A. Patrick, a prominent *ante-bellum* citizen of Jackson, Miss. At Covington, Ga., while stationed there in charge of hospital, his son, Mr. Robert Patrick Daniel, now of Tampico, Mexico, was born. From Mississippi, after the surrender, Dr. Daniel removed to Galveston and engaged in general practice, serving through that terrible epidemic of yellow fever in 1867. He lost his wife and infant daughter in Galveston, in the spring of 1867. Vacancies having been occasioned in the faculty of the Texas Medical College by the death of two of the members, Dr. Daniel was invited to take the chair of anatomy, which he accepted and filled the following session, 1867-68. He was then transferred to the chair of surgery, but owing to impaired health was not able to fill it, and resigned. In consequence of this impairment of health, the result of the yellow fever, he was compelled to give up practice, and engage in some pursuit where more sleep and rest could be had. He was out of the profession some four years. Regaining his health, he resumed practice in Jackson, Miss., in 1875, having in the meantime again married. His second marriage was to Miss Fannie Smith, second daughter of the late Hon. Adam Yakely Smith, formerly of Montgomery, N. Y., but for many years a prominent lawyer of Aberdeen and Columbus, Miss. While stationed in Jackson in 1878, the yellow fever broke out with great violence in Vicksburg, New Orleans, and other cities, and spread to the interior. At the village of Lake, Miss., it was unusually fatal, and assistance could not be had from any quarter, so great was the panic. Dr. Daniel then volunteered his services, and took charge of the sick, other physicians coming later to his assistance. This epidemic was remarkable for its virulence and fatality, and at the request of the commission appointed by Congress to report upon it, Dr. Daniel made a report which attracted much attention on account of some remarkable features observed in the epidemic. Later, to prevent the recurrence of epidemic yellow fever a National Board of Health was created, and a system of sanitary inspection

all over the South instituted. Dr. Daniel was appointed sanitary inspector for Mississippi, and in the summer of 1879 was in charge of the United States quarantine station below Vicksburg. He was a member of the Mississippi State Medical Association and contributed several papers to that body which are published in their Transactions. Six children were born of his second marriage, two sons and four daughters, of whom only three daughters, Marie, aged eighteen, Fannie, sixteen, and Gertrude, fourteen, are living. He removed to Sherman, Texas, in 1881. Here nothing but sickness and bad luck attended him and he removed the next year to Fort Worth, Texas. Worse luck. Here he lost his second and last son, and his wife followed soon after. Broken in health, and consequently impoverished, almost to the verge of want, and left with three little daughters from five to nine years of age, without a female relative in the world to look after them, he removed to Austin, and placed them with the Sisters of Mercy in a boarding school. Before leaving Fort Worth, in 1883, he established the *Courier-Record of Medicine*, at that time the only medical journal in Texas, and made a success of it. When he removed to Austin he sold it to the present owners, and in July, 1885, established *Daniel's Texas Medical Journal*, which is now (1893) in its ninth year, and has been remarkably successful. It is now a valuable property, and paying a good income. This *Journal* rendered an important service to Texas and the South, *i. e.*, to the medical profession, which has never been fully understood nor appreciated. When the committee, which had been, by the American Medical Association, appointed to go to Copenhagen and invite the International Medical Congress to hold its next session in the United States of America, made their report at New Orleans in May, 1885, instead of reporting that the invitation had been accepted they reported that they had organized the congress, and submitted the list of officers and sections down to the last detail. In making their selections this committee had acted on their own responsibility, having no authority or instructions from the association to do other than present the invitation, and the list of officers was taken entirely from New York, Pennsylvania and the East, with a sprinkling of Western, or rather, Northwestern representatives. They had ignored the South and the West almost entirely. Of the three or four appointees only one Texas man was mentioned, and he was at the tail of an unimportant section. The distinguished men of the South had obtained no recognition whatever, and consequently the South and the West were indignant as well at this slight as at the unwarranted action of the committee in proceeding to organize the congress without instructions. A large Texas delegation was present at New Orleans, as well as one from the West. When the report was read a vigorous protest was made by Dr. Shoemaker, of Pennsylvania, and Dr. Daniel made a speech setting forth the facts that the South, and especially Texas, had been unfairly treated, and stated that the profession of Texas and the South had claims to representation that could not be ignored, giving statistics in support of the claim, and closed by offering a resolution that the report of the committee be not received. This was carried, and some delegate then moved to refer the matter

of organization back to the committee, and that the committee be enlarged by the addition of one member from each State. This was also carried, and the enlarged committee met in Chicago and the congress was reorganized, the whole South receiving its share of the offices and Texas a good representation. Of the offices five fell to Texas, Dr. Geo. Cupples being made one of the vice-presidents. Dr. Daniel was appointed American secretary to the Section of Dermatology. (For several years he has limited his practice to that branch.) Then followed a war of words; the medical press divided on the subject, and a bitter controversy ensued. The large Texas delegation at New Orleans gave Dr. Daniel their support, and the Texas influence was felt. In the controversy that followed in the medical journals the *Texas Medical Journal* (Dr. Daniel's journal) took a prominent part, standing firmly for a fair division of the honors according to representation in the American Medical Association; and the move that resulted in defeating Dr. Billing's committee's organization and the appointment of a new committee was designated the "Texas kick." It was a "kick" to some purpose, and resulted in a revolution of the entire organization. But for the action taken by Dr. Daniel at New Orleans and his firm stand and earnest and constant agitation of the subject in the *Journal* it is probable that the committee's organization would have been adopted and thus Texas and the entire South and West deprived of a voice or representation in the Ninth International Medical Congress. At New Orleans in May, 1885, at a meeting of the Association of American Medical Editors, Dr. Daniel, by invitation, delivered an address, the subject of which was, "Texas Medicine and State Medicine in Texas." It was published in the *Philadelphia Medical Bulletin* of July and August of that year. He was elected Secretary of the Association of Medical Editors at that meeting. As a writer his contributions to the literature of medicine have not been voluminous; his best articles have been editorials in Texas journals. He did much to promote the organization of the medical profession in Texas, and at Georgetown, in 1886, delivered, by invitation, before the Williamson County Medical Society, an address on the "Necessity of Organization in the Medical Profession." This was published also in the *Medical Bulletin*. Dr. Daniel is an Episcopalian in religious belief; is a member of the Order of Knights of Honor, for which, in Austin, he has long been the medical officer. He is also Medical Referee for Texas for the Manhattan and other insurance companies, and examiner for others. In point of physique he is six feet in height, and weighs about one hundred and fifty pounds, with an erect carriage. Very social in his temperament, he takes little interest in politics, and devotes his time solely to the education and training of his children, and to the conduct of his journal, and does a small practice, exclusively in skin diseases. His writings are an earnest exposition of his convictions, fearlessly expressed, and have been characterized as "intensely original." As a man he has a popular turn, and has a host of attached friends. He held the office of Secretary of the Texas State Medical Association six years, having been elected on the death of Dr. Burt, in April, 1885. He resigned at the Fort Worth meeting in 1890,

and was immediately re-elected for five years; but again resigned at the Waco meeting, April, 1891. He organized The Physician's Mutual Benefit Association of Texas, and kept it alive by his individual efforts several years, collecting and distributing \$1,200 to twelve widows of Texas physicians. The association died for want of support by the profession.

DARR, Hiram Henry, of Caldwell, Texas, was born in Burleson county, that State, April 4, 1853. He is a son of George Darr, who was a soldier in the Texas war of independence. His mother was a native of Virginia, of an old family. He received a common school education, supplemented by private study. He graduated at the Louisville Medical College, February 25, 1875. He received the first honor prize for general proficiency in all the branches taught at the college, and the first prize in surgery. He received the *adeundum* degree from the Kentucky School of Medicine, June 24, 1875. He attended a course of lectures at the College of Physicians and Surgeons of New York City in 1879 and 1880. He practiced four years, from 1875 to 1879, near Hearne, Texas, and since April, 1880, at Caldwell, Texas. On October 25, 1881, he was married to Mrs. Lula Chiles, a young widow, of Caldwell, Texas. His practice has been general with a preference for surgery and diseases of the eye and ear. He is considered one of the most successful physicians in central Texas. He is a member of the American Medical Association, 1883; American Public Health Association, 1882; National Association Railway Surgeons, 1891; was a member of the Ninth International Medical Congress at Washington, 1887; is a member and was second vice-president of the Texas State Medical Association in 1884, joined in 1887. He is a member of the American Academy of Political and Social Science, 1892; has been local surgeon for the G., C. & S. Fe Ry. since 1882; was county physician from 1882 until 1891; and has been a member of the Board of Medical Examiners for the 21st judicial district of Texas since 1882. Dr. Darr was a member and president of the Board of Trustees of the public school of Caldwell from 1887 to 1889. He was one of the Board of Aldermen of the city of Caldwell, 1891-92. He is a Knight Templar Mason and a member of the Baptist Church. He is not a voluminous writer, having only at rare intervals contributed an article for the medical press. He was a member and president of the Burleson County Medical Association, 1885.

DAVIS, Nathan Smith, of Chicago, Ill., was born January 9, 1817. His parents, Dow and Eleanor (Smith) Davis, were among the pioneer settlers of Chenango county, New York, and the subject of this sketch, though the youngest of a family of seven children, was born in the primitive log house erected in the forest. His mother died in 1824, when he was but seven years of age; but the father lived to enjoy the fruits of his labors in converting his section of the forest into fertile fields, until he reached the ripe age of ninety years and twenty-five days. Dr. Davis was, from early childhood, of spare habit and very active, nervous temperament. His education was acquired in the common school of the district, by attending chiefly during the winter months, and during the remaining part of the year working diligently on the farm, until he was sixteen years of age. This out-door life and persistent manual labor

doubtless assisted much in the development of a healthy physical organization, and in creating habits of industry and independent self-reliance that have had much influence on his subsequent successful career in life. An inherent love of study, with unusual aptness in the acquisition of knowledge, had already placed him in advance of the subjects taught in the common school of his neighborhood. His father, discerning the strong bent of his mind, determined to procure for him as good an education as his limited means would permit. With that view, in his sixteenth year he was sent to Cazenovia Seminary, New York, where he studied chemistry, natural philosophy, history, algebra, and Latin. Although he remained only one season at the seminary, his taste for higher studies and a wider range of useful knowledge was confirmed, and in April, 1834, he commenced the study of medicine in the office of Dr. Daniel Clark, of his native

N. S. Davis

county. In October following he matriculated in the College of Physicians and Surgeons of the Western District of New York, and attended the annual course of instruction in that institution. At the close of the session he entered the office of Dr. Thomas Jackson, of Binghamton, N. Y., where he continued his pupilage until he had completed the required three years of study, including the four months of each year that he attended the medical college. He graduated with honor from the College of Physicians and Surgeons at Fairfield, N. Y., January 31, 1837, and before he was twenty-one years of age. His thesis was on "Animal Temperature," in which he contended that heat was evolved in the various tissues of the body instead of by the union of oxygen and carbon in the lungs, as was generally taught at the time. Its merits induced the faculty to select it as one to be read on commencement day as a part of the public exercises. In February, 1837, he entered into active general practice with Dr. Daniel Chatfield,

of Vienna, N. Y., but the isolated location was ill suited to his aspirations, and in a few months he gladly embraced an opportunity to enter a more desirable field in which to test his ambition. Accordingly, in July of the same year, he opened an office for himself at Binghamton, where he soon won the confidence of his professional brethren and the esteem and patronage of the community. On the 5th of March, 1838, he was united in marriage to Anna Maria, daughter of Hon. John Parker, of Vienna to whom he had become warmly attached during his brief residence in that town the previous year. The studious habits, and almost unwearying powers of application, developed in his youth, did not forsake Dr. Davis when he became engrossed in a laborious practice; on the contrary, he seems to have been constantly widening and extending his scientific inquiries. Among the sciences that early engaged his special attention were practical chemistry, medical botany, geology, and political economy. In studying the last-named science he embraced the most liberal views of free trade; paper currency *only* when founded on *amplissime* basis; equal and uniform laws for all classes, and special favors to none; and through a long life he has not failed to sustain them by voice and vote whenever a proper opportunity was offered. During his residence in Binghamton, he sought to perfect himself in surgical anatomy, and at the same time instruct the resident medical students by dissecting one or two cadavers each winter in a room attached to his office. At the same period he frequently, by special request, gave lectures in the Binghamton Academy and some of the larger district schools on topics connected with chemistry, botany, and physiology. He was one of the founders of the academy and took an active part in all measures having for their objects the increase and diffusion of useful knowledge and the improvement of the sanitary and moral condition of the people. During his medical pupilage he aided in forming the Lyceum Debating Society of Binghamton, and when he returned to that place to practice he resumed his membership, and by the frequent intellectual contests it afforded, overcame his natural diffidence so effectually that his professional contemporaries only knew him as a ready and forcible speaker. He was in early professional life elected a member of the Broome County Medical Society, in which he took an active part, holding the office of secretary during the years 1841, 1842 and 1843, and that of librarian from the last named year until 1847, when he removed from the county. He was also a member of the board of censors for several years. In 1843 he was a delegate from his county to the New York State Medical Society. He was already favorably known to the members of the State Society by his contributions, for in 1840, only three years after his graduation, he was awarded the prize offered by the State Society for the best essay on the diseases of the spinal column, their causes, diagnosis, history, and mode of treatment." And again in 1841 he received the prize offered for the best "Analysis of the Discoveries concerning the Physiology of the Nervous System," and continued to make valuable contributions to the Transactions of the society each year of his service as a delegate, and in taking his seat in the annual meeting in Albany for the first time, February,

1844, he offered a series of resolutions proposing a higher standard of medical education, by lengthening the annual courses of instruction in the medical colleges, the grading of the several branches in the curriculum, the separation of the power to license men to practice from the colleges and to confer it on independent boards of medical examiners, and the exaction of a fair standard of general education for the student before entering upon the study of medicine. These resolutions led to an interesting discussion which was resumed at the next annual meeting, 1845, at the close of which the following preamble and resolution were offered by Dr. Davis and adopted by the society: "Whereas, It is believed that a national convention would be conducive to the elevation of the standard of medical education in the United States, and whereas, there is no mode of accomplishing so desirable an object without concert of action on the part of the medical societies, colleges, and institutions of all the States; therefore, Resolved, That the New York State Medical Society earnestly recommends a national convention of delegates from medical societies and colleges in the whole Union, to convene in the city of New York, on the first Tuesday in May, in the year 1846, for the purpose of adopting some concerted action on the subject set forth in the foregoing preamble." Dr. Davis was appointed chairman of a committee to carry out the proposed measure and so actively attracted the attention of the profession throughout the whole country by circulars, individual correspondence, and articles in the medical journals that a successful convention was held at the time and place designated, and resulted in the establishment of the efficient, permanent, national organization known as the American Medical Association. Referring to Dr. Davis, an able and impartial writer has said, "the origination of the measures that led to this result, and the judicious and persistent manner in which he pressed them forward to a successful issue, justly entitle him to the deepest and most lasting gratitude of the medical profession of the United States." It may be claimed that the subject of this sketch is not only the originator of the American Medical Association, but that he has taken an active and influential part in all its proceedings during its whole subsequent history, extending over a period of almost a half century, having been absent from only four of its annual meetings since its organization. And, that with all the achievements of this Association, and the resulting present high standing of our profession, he is more thoroughly identified than any other individual. The more extended acquaintance with the profession gained by his attendance on the meetings of the New York State Medical Society and the National Conventions in New York City and Philadelphia, caused him to desire a wider field for professional work than Binghamton afforded, and accordingly in the summer of 1847, he removed to New York City and entered upon general practice. The following autumn and winter, at the solicitation of the Demonstrator of Anatomy in the College of Physicians and Surgery of New York, he took charge of the dissecting rooms and gave the instruction in practical anatomy, and by invitation of the faculty, he gave the spring course on Medical Jurisprudence. Almost from the first year after his graduation, he had been a

frequent contributor to the pages of the leading medical periodicals, and in 1848, took editorial charge of the *Annalist*, a semi-monthly medical journal, and continued his editorial work with ability until he removed from that city the last of August, 1849. In July, 1849, he was elected to the chair of Physiology and General Pathology in Rush Medical College, at Chicago, Ill., and accepted the position. A severe epidemic of cholera was then prevailing in New York, and in most of the cities, and in many of the rural districts throughout the whole country. Dr. Davis was devoting his time day and night to faithful attendance upon the sick, and he continued to do so until the severity of the epidemic had passed, near the end of August, when he left New York for a new home in Chicago, where he arrived with his wife and two children in the latter part of September, 1849. He gave the general introductory lecture at the opening of the college course, the first week of October, and from that time to the present, he has been actively identified, not only with medical teaching, but with about every important educational, scientific, and sanitary interest in Chicago. We learn from the *Magazine of Western History*, to which the editor is largely indebted for this biographical sketch, that at the time of his arrival the population of the city was little more than 23,000, located on a low and nearly level prairie, with a substratum of tenacious blue clay, for the most part obtaining water from shallow wells and no sewerage. They had suffered severely from the epidemic cholera during the preceding summer, and the same disease recurred during the three succeeding summers. With a view of developing a public sentiment in favor of very necessary sanitary measures to improve and protect the public health, and to aid in founding a permanent general hospital during the summer of 1850, Dr. Davis delivered a course of six public lectures in the old State Street Market. In these he pointed out the urgent necessity of a more abundant supply of purer water from Lake Michigan, and a general system of sewerage, and demonstrated by detailed illustrations the feasibility of both. The lectures were well attended, and the money received from a small admission fee was expended for twelve beds that constituted the beginning of what is now known as the Mercy Hospital, the oldest and one of the most important hospitals in the city, accommodating three hundred and fifty patients, and affording the most liberal facilities for clinical instruction. Dr. Davis continued his service as Senior Attending Physician to this institution until 1890, a period of nearly forty years. At the close of his first course of instruction in the chair of Physiology and Pathology during the college term of 1849-50, he was transferred to the chair of Principles and practice of Medicine and of Clinical Medicine in the hospital opened the following summer; which positions he held, and the duties involved, he discharged with an ability and fidelity rarely equaled, until the spring of 1859. But in his new position in Chicago, and as a member of the Faculty of Rush Medical College, he continued to advocate the same views of a higher standard of medical education that in the New York State Society had started measures resulting in the organization of the American Medical Association, while the college he entered continued to adhere to the require-

ment of attendance on only two annual courses of four months each for graduation. Consequently when in the spring of 1859, an opportunity was offered to assist in the organization of a new medical college on the plan of three years medical studies, three annual courses of college instruction of six months each, the curriculum graded to correspond with the three years of study, to which was added a moderate standard of preliminary education, and attendance on regular hospital clinical instruction, he did not hesitate to sacrifice the well earned popular position he held in the Rush Medical College, and accept the corresponding position in the new enterprise. The new medical college alluded to, now well known as the Chicago Medical College, and Medical Department of the Northwestern University, opened its first term in the autumn of 1859, with only thirty students. But its work has continued without interruption with a steady, healthy growth, until at the present time it ranks with the very best medical educational institutions in the country, and Dr. Davis is still doing active work as Dean of the Faculty and Emeritus Professor of Principles and Practice of Medicine. Finding on his arrival in Chicago no medical society in the city, and no State medical organization, he soon began the discussion of the many advantages derived from closer professional intercourse, and before the close of 1850, he had assisted in organizing the Illinois State Medical Society and the Chicago Medical Society, in both of which he has remained an active member until the present time. He was elected president of the State Society in 1855, and served as secretary of the same society for twelve years consecutively. His contributions to the transactions of both the city and State Medical Societies have been very numerous, practical in their character and nearly all of them have been published in the local medical journals. Already trained to medical journal writing in New York, on arriving in Chicago he immediately became a valuable contributor to the pages of the *Chicago Medical Journal*, a monthly periodical; and in 1855 became its leading editor and publisher, and continued so until 1859 when resigning his position in the faculty of Rush Medical College he transferred the journal to the president of that college, Dr. Daniel Brainard, who claimed that it had been established as the organ of that faculty. In January following, however, he commenced editing and publishing a new monthly medical journal called the *Chicago Medical Examiner*, which he continued as an independent and valuable journal until 1873, when it was transferred to the Chicago Medical Publication Association, and it was united with the *Chicago Medical Journal* under the title of the *Chicago Medical Journal and Examiner*. Concerning the part taken by Dr. Davis in the American Medical Association, Dr. J. M. Toner, of Washington, says: "During the reading of reports and the business of the general session he is always an attentive observer. From the first meeting he has been most always on one or more of the important committees, and has made more reports than any other member. His official duties have not kept him from presenting valuable papers on a variety of subjects of professional interest. His contributions to this association are so numerous that I will not attempt to give even the titles. The deep and intelligent interest he

has always taken in its success and in the elevation of the profession has been apparent to all its members, as well as to the professors in the medical colleges, and to every reader of American medical literature. No member has ever had so clear a perception of the proper scope and real province of the association as Dr. Davis. As a consequence, whenever perplexing questions have come up in the meetings no one was so able to make plain the duty of the hour, and to suggest the best modes of disposing of them. He has been honored by election to almost every position within its gift, and twice chosen its president. He is an exceedingly good debater, a close and logical reasoner, always self-possessed, animated in voice and magnetic in manner, with a degree of familiarity and accurate knowledge of the medical institutions of our country and the views of the leading medical men that is not equaled, certainly not excelled, by any other physician who has attended the meetings. This gives him at once a decided advantage in directing debates on all questions affecting the purposes or powers of the association. From the first meeting he has kept steadily in view the elevation of the standard of medical education and has finally convinced the profession of our country and the faculties of the colleges that their lecture term ought to be increased and the classes graded. Since the foregoing paragraph was written, in 1877, Dr. Davis has rendered no less valuable service to the association and to the profession of the whole country than before. At the annual meeting of the association in 1883 it was decided to publish its transactions in the form of a weekly journal, instead of an annual volume as had been done previously, and he was selected to edit the same. He issued the first number, called the *Journal of the American Medical Association*, in July, 1883, and he continued its editorial management with the same promptness, ability and good judgment that had characterized all his previous work until January 1, 1889. Having established the journal on a sound financial basis and with a reputation second to no other medical periodical in the country he formally resigned his position, but was not fully relieved from editorial work until the succeeding June, which was near the completion of its twelfth volume. In 1884 the eighth International Medical Congress, then in session in Copenhagen, Denmark, agreed to hold the ninth meeting in 1887 at Washington, D. C., and it became necessary for the profession in this country to effect a preliminary organization and all the necessary arrangements for the congress. During the year 1885 an executive committee was organized with full power to make all further arrangements for the approaching international gathering. The late Dr. Henry H. Smith, of Philadelphia, was made chairman of the executive committee, the late Dr. Austin Flint, of New York, was selected president of the congress, and Dr. N. S. Davis, of Chicago, was made secretary-general. It was while actively conducting the necessary correspondence of the latter office in addition to his editorial work on the journal, and his usual private practice, hospital and college duties in January, 1886, that he awoke from sleep with complete hemiplegia of the right half of the body and extremities. The paralysis, however, proved temporary, and after a rest of three or four weeks he

cautiously resumed his duties, official and otherwise. At the meeting of the executive committee of the congress in May, 1886, Dr. Flint having died suddenly a few months previously, Dr. Davis was elected to fill the vacancy, and he transferred all the papers and records of the secretary-general in good order to his successor in that office, Dr. John B. Hamilton, of Washington. In August, 1887, the ninth International Medical Congress was held in Washington, and in the completeness of the arrangements, the members in attendance, the amount of scientific and practical work done, and the liberality of its entertainments it was fully equal to any of its predecessors. Dr. Davis presided over its deliberations and discharged the duties of his high office with an ability and urbanity highly satisfactory to all parties. Should this biographical sketch stop here, the reader would infer that Dr. Davis had devoted his long professional life mostly to literary, editorial and medical society work. But so far from this, all these were but side plays or recreations of one whose main life work has been and still is at the bedside of the sick. In a few months after his arrival in Chicago he found himself fully engaged in a laborious general practice. During the cholera epidemic, from 1849 to 1852, and in 1854, and again in 1866, he was unremitting in his attention to the sick. With reference to this, Dr. Toner, the biographer previously quoted, says: "I have been a guest at his house when he lived in Chicago, and know something of the life that he leads, which is far more laborious than that of any physician with whom I am acquainted. Daily his office was filled with patients from six o'clock in the morning until twelve; he then visited his patients in private families, or repaired to the hospital, or to the college to lecture, being often occupied up to eleven or twelve at night." He was often called in consultation long distances, and has been through life remarkably punctual in his engagements with his professional brethren and his patients. Neither has he ever neglected the duties of good citizenship, but has taken an active part in all important scientific, educational and moral enterprises. He was one of the founders of the Northwestern University, of the Chicago Academy of Sciences, the Chicago Historical Society, the Illinois State Microscopical Society, the Union College of Law,—in which he is Professor of Medical Jurisprudence,—the Washingtonian Home for the Reformation of Inebriates, and one of his earliest organizations was in behalf of systematic relief of the destitute. In this latter work he had for associates such men as Stephen Higginson, Charles Walker, Jonathan Burr, and Tuthill King, all now gone to their final rest. Of his personal qualities and habits when in the most active and vigorous period of his life, one who enjoyed his most intimate acquaintance wrote as follows: "As a man, Dr. Davis is endowed by nature with an organization, both physical and mental, capable of great endurance. His form is slight, but symmetrical and muscular. His health has been uniformly good for the last thirty years, not having been confined to the house at any one time more than three days in succession. His habits are regular, both as to eating and drinking. He has never used alcoholic drinks in any form, nor tobacco. His intellectual characteristics are well marked, and are such as especially fit

him for the profession to which he has devoted his life. It is particularly in his powers of observation that he is pre-eminent. Nothing in the history of a patient escapes his attention. All the antecedents, such as occupation, climatic exposures, mental and emotional states, hereditary tendencies, temperaments and personal peculiarities, are thoroughly investigated. This quality of his mind is especially manifested in his clinical lectures. His reasoning powers are good, his logic usually convincing, always carrying with it the impression that he is thoroughly and conscientiously in earnest. His comparisons are quick and his judgments reliable. As a teacher he is enthusiastic; a skillful debater and a prolific writer. Indeed, we should say that he both speaks and writes too much. During some of the college sessions he has delivered ten didactic and clinical lectures weekly for several months in succession. The subject-matter of his lectures is always interesting, and no teacher is listened to with more patience or followed with a greater degree of enthusiasm. He is genial in his nature, and both at the bedside of his patients and in the social circle his pleasant smile and kindly voice inspire confidence and beget friendship. The influence and example of Dr. Davis have always been on the side of virtue and good morals. Since his sixteenth year he has been a constant member of some branch of the Methodist Church, taking an active part generally in sustaining all moral and religious institutions. His public, and especially his private, charities have been large and continuous. With a practice larger, perhaps, than that of any other member of the profession in the West, he never refuses the call of the sick poor. There are thousands in our midst struggling with want and heart-sick with hope deferred to whom the remembrance of his generous kindness brings a thrill of grateful pleasure." [See biographical sketches of the leading men of Chicago. Wilson & St. Clair, publishers, 1868.] Only three years after the paragraphs just quoted were written, the great Chicago fire consumed nearly all the accumulations of his previous professional life. But instead of stopping for murmuring words or vain regret, with unwavering trust in Him who governs all things, he moved on with quicker steps and unflinching energy, aiding in every possible way the sick and helpless around him. His home has ever been a pattern of neatness and domestic enjoyment, characterized by a liberal hospitality. It is still presided over by the wife of his youth, a matron whose highest earthly ambition through life has been to maintain a well-ordered, attractive and loving home; made doubly attractive by the presence of well-trained and affectionate children. In addition to the very large number of valuable papers, reports, and addresses communicated to medical societies and medical periodicals, Dr. Davis is the author of the following publications in book-form: "A Text-Book on Agricultural Chemistry, for Use in District and Public Schools," for which a prize was awarded by the State Agricultural Society of New York, 1848; "History of Medical Education and Institutions in the United States, from the First Settlement of the British Provinces to the Year 1850, with a Chapter on the Present Condition and Wants of the Profession, and the Means Necessary for Supplying those Wants," 1851; "A Lecture on

the Effects of Alcoholic Drinks on the Human System, and the Duties of Medical Men in Relation Thereto," delivered in the Rush Medical College, December 25, 1854, with an appendix containing original experiments in relation to the effects of alcohol on respiration and animal heat; "History of the American Medical Association, from Its Organization to the Year 1855;" "Clinical Lectures on Various Important Diseases, 1875;" "Lectures on the Principles and Practice of Medicine," delivered in the Chicago Medical College, 1884, second edition, 1887; "Address on the Progress of Medical Education in the United States of America, During the Century Ending in 1876," delivered before the International Medical Congress, at Philadelphia, September 9, 1876, published in the volume of transactions of that congress. The chapter on "Bronchitis," in the American System of Medicine, edited by W. Pepper, Philadelphia; the chapters on "Chronic Alcoholism, Polyuria, and Chronic Articular Rheumatism" in the Reference Hand-book of Medical Sciences, New York, Wm. Wood & Co., 1886; and the "Address of the President of the Ninth International Medical Congress," delivered before the congress in Washington, D. C., August, 1887. Published in the first volume of the Transactions of the congress, 1887.

DAVIS, Nathan Smith, Jr., of Chicago, was born in that city September 5, 1858. He is the youngest and only living son of Dr. N. S. Davis. He graduated A. B. at Northwestern University in 1880. In 1883 he received the degree of M. D. from Chicago Medical College, and the same year A. M. from his *Alma Mater*. During his literary course he received a prize for the best English essay. In his Junior year he published, with a fellow-student, a descriptive catalogue of the Reptilia and Batrachia of Eastern North America. He was a diligent student of natural science and devoted his vacations and much of his spare time to this favorite pursuit. At this time he made a trip to South America. The voyage was taken for his health. While there he made collections in departments of herpetology, ornithology and geology. During his medical course he was awarded prizes for first rank in his class and for the best original thesis. A year later he was appointed visiting physician to Mercy Hospital, a position he has held ever since. At about the same time he was made assistant to the chair of pathology in Chicago Medical College. The spring and summer of 1885 he spent in Europe, chiefly at Heidelberg and Vienna, where he devoted his whole time to the study of pathology. This was his second visit to Europe. When he returned all the teaching in the department of pathology devolved upon him. He inaugurated the first laboratory course in pathology given in his *Alma Mater*. In 1887 he was made adjunct Professor of Principles and Practice of Medicine in Chicago Medical College, now Northwestern University Medical School, and full professor to this department the following year. This chair he has occupied ever since. Besides didactic instruction he has given clinics in Mercy Hospital since 1886. In 1888 he was secretary of the section of Practical Medicine of the American Medical Association. In 1892 he was made a member of the executive councils of that association by the section of Practical Medicine. He is chairman of the section of Practical Medicine of the Illinois

State Medical Society for 1893. He is also a member of the Pharmacopeia Revision Committee, a member of the Chicago Academy of Science, Illinois Microscopical Society, Chicago Medical Society, Chicago Literary Club, fellow of the American Academy of Medicine, member of the board of managers of the Chicago Young Men's Christian Association, and member of the board of trustees of Northwestern University. He has contributed numerous articles to current medical literature. He is the author of a small volume devoted to personal hygiene and entitled "Consumption, How to Prevent It and How to Live With It." He has also written a work on "Diseases of the Lungs, Heart and Kidneys." He is widely known as a successful and popular practitioner and teacher of medicine. In 1884 he married Jessie Hopkins, of Madison, Wis., daughter of the late Judge Hopkins, of that city.

DAVIS, Thomas Archibald, of Chicago, Ill., was born at Ingersol, Ontario, December 22,

Thos. A. Davis

1858, and was soon after brought to the United States where he has since remained. He is of English-Scotch descent. His father was formerly from the British metropolis, and his mother was born in Edinburgh, Scotland. Dr. Davis was educated in the common schools of Wisconsin and at Gale College, leaving the latter for lack of funds, after two years of attendance, to take the principalship of the Independence, Wisconsin, village school. After teaching thirty months, during which time he studied medicine, he entered Rush College in 1879. Again being obliged to leave school for lack of funds, he engaged with Messrs. Dunwoody & Corson of New Richland, Minn., as bookkeeper, and remained with that firm for

three years. During the three years' time a business of \$1,000,000 annually was done by this large milling and elevator company, and in the absence of Messrs. Dunwoody & Corson Mr. Davis was given full charge of its finances. His honesty and indefatigable energy won him the greatest admiration and friendship of his employers, and every means were taken by them to continue him in their employ, when he resigned, giving a year's notice to his employers. During the three years of business every spare moment was given to medicine and much progress was made under the instruction and tutorship of Dr. Carroll Corson, then a recent graduate of the University of Pennsylvania. He continued his college course in 1883 in the College of Physicians and Surgeons of Chicago, graduating from that institution with honors in 1885. After a three days' written examination, with over thirty competitors, he won the position of internship to Cook County Hospital and served the full term of eighteen months in that institution, leaving to enter private practice in 1887, and to assume a lectureship on surgery in the College of Physicians and Surgeons, serve as surgeon to the West Side Free Dispensary, and to be assistant-in-chief to Prof. Christian Fenger's Surgical Clinic. In 1893 he was elected Adjunct Professor of Surgery and Clinical Surgery in the College of Physicians and Surgeons. In August, 1893, he married Jennie McKie, daughter of the Hon. J. L. McKie, of Three Oaks, Mich. Dr. Davis enjoys a large general practice, and a well earned reputation in both medicine and surgery.

DAVIS, William Elias B., of Birmingham, Ala., was born in the county in which that city is located, November 25, 1863. He graduated in medicine at Bellevue Hospital Medical College in 1884 and located in Birmingham the same year, where he was associated with his brother, Dr. J. D. S. Davis. In January, 1892, he accepted a partnership with Dr. J. B. S. Holmes, of Rome, Ga., in a large sanitarium for the diseases of women, but only remained in Rome a few months when he returned to Birmingham and he and his brother established a private hospital for surgical and gynecological cases. The *Alabama Medical and Surgical Age* speaks thus on the occasion of his removal to another field of practice. "Dr. Davis' departure from Alabama will cause universal regret; for he has many warm personal friends in the State, and is very popular with the entire profession. He has been a very liberal contributor to medical literature, and has done active and valuable work in a number of medical organizations. He did the leading abdominal surgery and diseases of women practice in this State, and has done more to develop abdominal surgery in Alabama than any other man in the State. He and his brother edited the first medical journal in the State, which was recognized as one of the best monthlies in the country. He afterwards became editor of the gynecological department of the *Alabama Medical and Surgical Age*, and he is still a collaborator in this journal, and also a collaborator on one of the leading journals of Missouri and an associate editor of the *American Gynecological Journal*. He was formerly secretary of the Alabama Surgical and Gynecological Association, and from this Association, through his labors, was developed the Southern Surgical and Gynecological Association,

which is one of the leading special societies of America, and of which he has been the secretary since its organization, and, as secretary, the editor of its transactions and a member of its executive council. Two years ago he was elected secretary of the surgical section of the American Medical Association, and at the Washington meeting, he was elected one of the vice-presidents of the Association. In addition to the above he is ex-president of the Tri-State Medical Society of Alabama, Georgia and Tennessee; member of the Judicial Council and of the Business Committee of the American Medical Association; one of the honorary presidents of the gynecological section of the Pan-American Medical Congress; fellow of the American Association of Obstetricians and Gynecologists, the British Gynecological Society and of a number of other societies. He has been a liberal contributor to medical literature, and in 1892 delivered the alumni lectures before the College of Physicians and Surgeons of Baltimore on "Local and General Peritonitis."

DAWSON, Benjamin Frederick, of New York City, was born there June 28, 1847, and died April 3, 1888. He began his medical studies during the early part of the civil war. He served as acting assistant surgeon in the United States army, in 1865, and was graduated at the New York College of Physicians and Surgeons, in 1866. He settled in New York and made a specialty of surgery, gynecology and diseases of children; established the *American Journal of Obstetrics*, in 1868, and was editor of the same until 1874. He invented a galvanic battery for galvano-caustic surgery. He held the position of assistant surgeon of the Women's Hospital, attending physician of the New York Foundling Asylum, was a member of the New York Obstetric Society, and held the chair of gynecology in the New York Post-Graduate Medical School.

DAWSON, William W., of Cincinnati, Ohio, was born of highly respectable parents, in Berkeley county, Virginia, in 1824, and died February 16, 1893. Referring to the death of this noted physician and surgeon one of his colleagues, Prof. Thad. A. Reamy, whose friendship and intimate acquaintance extended over a period of nearly forty years, says: "Such an excellent constitution as he possessed, first by inheritance, second by a robust outdoor life in boyhood, should have lasted at least twenty years more. But when a man works so constantly as he worked, at any pursuit which so taxes body and mind as does the practice of medicine and surgery, with the anxieties, deprivations and exposures, unavoidable, he does well to reach the age of sixty-nine." From a recent address delivered at the commencement exercises of the Medical College of Ohio by Dr. Reamy (April 6, 1893), we quote the following particulars relating to the life history and professional achievements of the subject of this sketch. When but a boy (1829) young Dawson with his parents removed to Green county, Ohio, settling near Xenia. He was educated in the village school and engaged in teaching, continuing self-culture. When quite a young man he had acquired considerable local reputation as a lecturer on geology, botany, and kindred subjects. He studied medicine in Jamestown with his brother, Dr. John Dawson, a noted physician, graduating from the Medical College of Ohio, in

1850, and spent one year as house physician in the Commercial Hospital, Cincinnati. He then returned to Green county, locating in Paintersville, where he practiced one year. In 1850, he married Miss Margaret Y. H. Hand, of Hillsboro, Ohio, a granddaughter of Gen. Hand of the Revolutionary War, and moved to Yellow Springs, where he was associated with Dr. Thorne, in the practice of medicine. He remained there for about a year, and becoming tired of the country, he concluded to try his fortune in Cincinnati. From 1854 to 1857, he was Professor of Anatomy in the Cincinnati College of Medicine and Surgery. From 1860 to 1865, he taught anatomy in the Medical College of Ohio. In this department he soon acquired fame as a teacher, so that many graduates in medicine and surgery sought places as pupils in his anatomical classes. Here, also, it is natural to suppose, he laid the essential foundation for that fame as a surgeon that he was subsequently to achieve. From 1864 to 1871, he was a surgeon on the staff of the Cincinnati Hospital, delivering clinical lectures to the crowds of students who annually sought instruction in that institution. His accuracy in diagnosis, and skill in operating, were qualities manifested to a marked degree. In 1871, he was elected Professor of Surgery in the Medical College of Ohio, a position vacated by the death of the celebrated Dr. George Blackman. During his occupancy of this position, he established a national reputation as a clinical and didactic teacher. In 1884 he resigned the chair of the Principles and Practice of Surgery in the Medical College of Ohio, to accept from the same institution the chair of clinical surgery, a position he held at the time of his death. He was succeeded in the chair of surgery in the Medical College of Ohio, by Dr. P. S. Conner, who at present fills the place with such marked and universally recognized distinction. Dr. Dawson was surgeon on the staff of the Good Samaritan Hospital from 1871 until the time of his death. During his professional career he was a member, and president, of the following societies: The Cincinnati Academy of Medicine, The Ohio State Medical Society, The American Medical Association, The Humane Society. In this society he took a deep interest. First, because its work appealed to his heart; second, it had been one of the creations of his noble wife, and its objects were dear to her, therefore ever to be cherished by him. Dr. Dawson wrote no books. His professional labors were too exacting for such work. Moreover, he was practical, original, having neither the tastes nor the character of mental training, qualifying him for compilation or critical analysis. Yet he found time to contribute many articles to current medical literature. His papers, like his lectures, were clear, practical and suggestive. They invariably commanded attention, being widely quoted. Among the subjects discussed by him, in original articles, may be mentioned: "Graves Disease," "Abdominal Tumors," "Excision of Joints," "Removal of the Clavicle," "Tracheotomy," "Anesthesia," "Nephrotomy," "Dislocation of the Femur," and others. What has been said as to the positions filled by him imperfectly indicates the estimate placed upon his ability and usefulness by his professional brethren. The unworthy and incompetent may, through fraud and influence secure appointments and posi-

tion. But if without capacity and merit, the advantage can not be maintained, but through position secured, their downfall is the more certainly assured. In no position in which he was placed was our friend wanting. In every cause which he espoused he proved himself to be strong, and grew in power and usefulness. These strong words of praise do him but simple justice, up to the time when the insidious encroachments of bodily and mental disease impaired his strength. Let us for a moment inquire further into the causes of the extraordinary success and popularity attained by our hero. As to success, he possessed three qualities which will always win it, no matter in what honorable pursuit engaged, viz.: mental capacity, powers of endurance, sustained industry. By the exercise of these qualities, without money or influence, he secured his education. For many years after he offered his services as a physician in this city, he struggled with pinching poverty. But success at last came, and he enjoyed a most lucrative general practice, numbering among his clientele many of the first families. Probably he could not have become so great as a surgeon, but for his broad practical experience as a physician. Such an experience wonderfully enlarges a man's field of vision, broadens his judgment, and increases his surgical resources. Dr. Dawson's special tastes for surgery, and his eminent skill in that department, will thus be seen to have been the products of gradual evolution. He was rapid, at times brilliant, as an operator, and his operations covered almost every department of operative surgery. But his hand was controlled by that degree of safe conservatism, which comes only of knowledge; a knowledge of the science as well as the art of surgery. Ohio, Kentucky and Indiana, were the fields of his greatest activity as a consultant, but his counsel and skill were sought in other States, medical men everywhere having confidence in his judgment, and glad to receive his aid. It is seen, therefore, that a chief element of his professional popularity is found in his intrinsic strength. Again: he never betrayed a colleague, never played the wise man in conversation aside, with members of the family, or other friends of the patient. The reputation of no medical man ever unjustly suffered at his hands. He believed that if he injured a neighbor he injured himself. His conduct was always in correspondence with his belief. He was loyal to his profession, proud of its achievements, jealous of its fair name, and on all occasions, both by words and deeds, a courageous and able defender of its rights. During the days of his strength, he sought by every legitimate means to elevate its standard. Why was he personally so popular, not for a brief season only, but throughout his long career? Because he earnestly and willingly labored for the relief of suffering humanity, was generous and kind to the poor, was sincerely deferential and chivalrous to women, was genuine and unselfish in his friendships, his memory never proving treacherous to their obligations. He was a man who, under all circumstances, spoke the truth, hated hypocrisy, deceit and shams. Conspicuous for such traits of character, he could only be beloved, and honored, by the laity and by the profession. Dr. Dawson was not a communicant in any church, made no profession of religion, but he was sincerely a God-fearing man.

The qualities and virtues of his heart and soul were of divine implantation. And the fruitage shall not be lost. He firmly believed in immortality.

"Life is but a passing shadow,
Virtue not an idle dream,
And the Christian soul departing,
Doth not glide on Lethe's stream,
For the soul that's pure but enters,
Through the glimmering shades of gloom,
To the vision of Elysian
Happiness—beyond the tomb."

DEAN, Henry Munson, of Muscatine, Iowa, was born in Canaan, Litchfield county, Conn., and is of English ancestry. His mother was a descendant of Captain Munson, who served his country in the Revolutionary War. Young Dean's academic education was received at Falls Village, Conn., and he studied medicine under the preceptorship of Dr. L. H. Aiken. His medical degree was received from the College of Physicians and Surgeons, New York, in 1861. He first established himself in practice in his native village, where he remained until July, 1862, when he was appointed an acting assistant surgeon United States army, and served in this capacity until 1865, and was then commissioned assistant surgeon United States Veteran Volunteers, and held his position until 1866. As a medical officer, he had charge of the right half of the 1st Regiment Massachusetts Volunteers (army of the Potomac), from July to September, 1862. During that time he was appointed surgeon of the brigade (1st Brigade, 2d Division, 3d Army Corps), but did not accept the appointment. In September, 1862, when the Third Corps Hospital was organized, he was assigned to it for duty where he remained until the hospital was disbanded, in the spring of 1863. He was then ordered to report to the medical director at Washington, D. C., by whom he was assigned duty at Lincoln United States General Hospital of that city, where he remained eighteen months, and was then placed in charge of Barrack Branch Hospital, also in Washington. On February 20, 1865, he was appointed assistant surgeon United States Veteran Volunteers, and was assigned to the First Regiment and First Brigade of General Hancock's Corps, and served in that capacity until January 10, 1866, when was mustered out of the service. In 1863, Dr. Dean performed tracheotomy for diphtheretic croup; the patient recovering with loss of voice; and also resected the shoulder joint three times, with two recoveries. In 1869, he removed an enormously-enlarged thyroid gland, with recovery of patient, and has successfully performed numerous other important surgical operations. After the war, he located to practice his profession at Sandwich, Ill., where he remained until February, 1867, when he established himself at his present place of residence, and where, for the last twenty-six years, he has been engaged in an extensive and successful medical and surgical practice. He has been president of the Iowa and Illinois Central District Medical Association; Eastern Iowa Central District Medical Association, and of the Muscatine County Medical Society. He has also been president of the board of United States examining surgeons for pensions of his city since its organization, and is surgeon of the C. R. I. & P. Railroad, and of other important railways of his State.

DENISON, Charles, of Denver, Col., was born in Royalton, Vermont, November 1, 1845,

Charles Denison

where his grandfather, Joseph H. Denison, and his father of the same name, were physicians of note. He received his early education in his native town, and finished his collegiate course at Williams College, Williamstown, Mass. In 1869 he graduated as valedictorian from the medical department of the University of Vermont. He then studied in New York City for one year; and was house surgeon of the Hartford City Hospital for the same length of time, afterward settling at Hartford, Connecticut. After having a pulmonary hemorrhage, in 1872, he removed to Texas and Florida. In 1873 he went to Denver, where he soon regained his health, and has specially devoted himself to the study of climate in relation to the cure of chest diseases. He was president of the Denver Medical Association, and has served as secretary of the State Medical Society, of Colorado. He is also a member of the American Medical Association and the American Climatological Association, of which he has been president. He holds the chair of diseases of the chest and climatology in the medical department of the University of Denver. He is an indefatigable worker, and has found time during an unusually busy professional life, to contribute a large number of valuable articles to medical literature on his special branch. Of these, his work on "Rocky Mountain Health Resorts," is probably the most noted. Among his other articles are: "Colorado as a Health Resort in Winter;" "Influence of High Altitude on the Progress of Phthisis;" "The Preferable Climate for Consumption;" "Report on Tuberculin." One of his latest papers, "Tuberculin and the Living Cell," was read before the American Climatological Association a short time ago. At the Milwaukee meeting of the American Medical Association, in June, 1893, Dr. Denison read before the section of medicine an exceedingly interesting paper of great

scientific importance, entitled, "The Mutual Interest of the Medical Profession and Insurance Companies in the Prolongation of Life." He is the inventor of several instruments, among them being the Denison stethoscope, an improved spirometer, and a manometer; as well as the extension windlass (gags for use chiefly in intubation), and a rib cutter (for resection and tapping); other important devices are also well known contributions to his specialty.

DE ROALDES, Arthur W., of New Orleans, La., was born in Opelousas, La., January 25, 1849. He is the oldest son of Dr. A. de Roaldes and of Coralie de Folmont, both representatives of two old families of the South of France. His grand uncle, General Garrigues de Flaujac, an emigrant during the French Revolution, was one of the heroes of the battle of New Orleans in 1812. His classical education was acquired in France at Jesuit Colleges, and with private preceptors. In 1865, he received the diploma of Bachelor of Arts after a public examination before a jury of the University of France. The following year the diploma of Bachelor of Sciences was granted to him in the same manner. The outbreak of cholera in Paris in 1866 having closed the preparatory schools he returned to New Orleans, entered the Charity Hospital as a resident student, and graduate at the medical department of the University of Louisiana in 1869. He returned immediately to Europe to continue his studies and had just passed his last examination for the title of "Doctor in Medicine of the Faculty of Paris" when the

Arthur W. de Roaldes

Franco-Prussian war commenced. On the recommendation of Professor Nélaton and of his fellow-countryman and friend, Dr. Marion

Sims, he was commissioned assistant-surgeon and sent to the front with the Sixth International Ambulance. On the eve of the battle of Sedan his name was mentioned in the order of the day for an act of bravery on the battlefield, when, during the retreat, under a very heavy and close fire of the enemy, he saved the ambulance corps and a number of wounded by flying the flag of the Red Cross over the roof of the building. He served subsequently in the "Armée de la Loire" until the end of the war. During the outbreak of the French commune he organized and directed the ambulances of Chaville and Ville d'Avray. In 1872 he returned to his native State of Louisiana, was Chief of Clinic of Professors Richardson and Logan, visiting surgeon at different periods of the Charity Hospital, and in 1880 House Surgeon. From 1887 to 1889 he spent the spring and summer months abroad to familiarize himself with the study of diseases of the ear, nose and throat, and finally abandoned general practice in 1889, when, with the help of the charity inclined, public spirited citizens, he founded the Eye, Ear, Nose and Throat Hospital, one of the most flourishing institutions of its kind in the United States. In 1890 he was chosen to the chair of diseases of the ear, nose and throat in the New Orleans Polyclinic School of Medicine. In 1892 he was elected vice-president of the State Medical Society, and also a corresponding member of the Société Française d'Otologie, de Rhinologie et de Laryngologie. In 1893 was made president of the Medical Society of the Parish of Orleans and a Fellow of the American Laryngological Association. He has contributed to various medical journals, and is a collaborator of the "Revue d'Otologie de Laryngologie et de Rhinologie" and of the "New Orleans Medical and Surgical Journal." His most important papers are a study on "Gunshot Wounds of the Femur," which deserved a mention honorable from the Faculty of Medicine of Paris; a dissertation on "Post Nasal Adenoid Growths and Their Treatment;" on "Atresia of the Larynx" and on "Cases of Alarming Epistaxis of Grippal Origin and Dangers of Post Nasal Plugging." He was for several years examining physician of the New York Life Insurance Company, surgeon of the Southern Pacific Railroad Company and surgeon of the First Brigade of the Louisiana State militia.

DEWEES, William Bushey, of Salina, Kan., was born in Berks county, near Reading, Pa., July 18, 1854. He is the only son of George Dewees and Catharine (*nee* Bushey) Dewees. His father was of French descent, and his mother's lineage is of English extraction. His grand-uncle, Prof. William Potts Dewees, was Professor of Obstetrics in the University of Pennsylvania, up to 1835, and is recorded as one of the fathers of obstetric science in America. His earlier education was confined to winter schools and night study. When fifteen years of age, he passed a creditable examination for a certificate to teach in the public schools. He taught two winter terms and during the summer months attended the Keystone State Normal School at Kutztown, Pa. His classical education was acquired at Ursinus College and at the University of Pennsylvania. He read medicine in the offices of Drs. J. C. and L. A. Livingood, at Womelsdorf, Pa. He was graduated in medicine at the University

of Pennsylvania on March 12, 1877, with distinguished honors for the merits of his thesis, entitled, "Means of Alleviating the Sufferings of Parturition." He immediately began the practice of his profession at Myerstown, Pa., but removed to Salina, Kan., in August, 1885. He never contributed a line to medical literature until after he had ten years of practical experience. Thus we find his writings date from 1887, and are confined up to the present time (1892), to a period of five years, being acknowledged as very valuable contributions, for original and advanced thought, to medical literature. Among the articles published by him may be mentioned: "Impure Sexual Intercourse the Primitive Cause of Syphilis Scrofula and Phthisis;" "Too Much Medicine;" "Food and its Digestion;" "The Physician's Duty to His Profession;" "Malarial Affections;" "Influenza—La Grippe;" "Digitalis—

William B. Dewees.

Indications for the Use of;" "Disease by Imagination and Cure by Suggestion;" "The Vaginal Tampon and its Uses;" "Amenorrhea and its Treatment;" "Fetid Menstruation or Feteo-Menorrhoea;" "Obstetric Notes, Based upon 1,000 Consecutive Obstetrical Cases in Town and Country Practice;" "Relaxation and Management of the Perineum During Parturition;" "Relation of Gynecology to Neurology;" "Sanitation *versus* Do-Nothingism;" "The Iatrie Palestra," and "A new Axis-Traction Obstetric Forceps." Dr. Dewees is a fellow of the American Association of Obstetricians and Gynecologists, having been unanimously elected to membership in this organization during its last meeting in September at St. Louis, Mo. In July, 1892, he was specially favored with an invitation and personal urging to prepare a paper and to read the same before the International Periodical Congress of Gynecology and

Obstetrics at Brussels in the following September, which he accepted and is now engaged in preparing said paper, and expects to join the American delegation within a few weeks to go abroad. The title of his paper for this occasion is "A Much Neglected Essential Factor in Gynecology—External Support." Dr. Dewees was the originator of the Golden Belt Medical Society of Kansas, which was organized in 1888, and was honored by his fellows who elected him unanimously its third president in 1891. He received the high honor of vice-president of the First Pan-American Medical Congress for Kansas, at the meeting of the committee on permanent organization at Detroit, Mich., in June, 1892. His mode of "Managing the Perineum During Parturition," presented in 1889 after years of patient trial, and his "Axis-Traction Obstetrical Forceps," presented before the American Medical Association at Detroit, June 7, 1892, are worthy of special mention, since the leading minds in the profession, not only in America, but in England, Germany and France, have commented very favorably on them.

DEWEES, William Potts, of Philadelphia, Pa., was born in Pottsgrove, Pa., May 5, 1768, and died May 18, 1841. His parents were of Scottish origin. As his family were not in affluent circumstances, in his youth he had to contend with difficulties in obtaining an education, and to make amends for the want of extensive means of intellectual training and industry and perseverance in the use of such as were within his reach. He determined early to study medicine, and was for this purpose placed by his father in the establishment of Dr. Phyle, a practicing apothecary. Under the superintendence of this gentleman he acquired a knowledge of pharmacy and its collateral sciences. He subsequently entered the office of Dr. William Smith, and during his continuance in this position and residence in Philadelphia attended lectures in the University of Pennsylvania. In 1789 at the age of twenty-one years, he took the degree of Bachelor of Medicine. The early professional life of Dr. Dewees was spent in the country, at Abington, a settlement to the north of Philadelphia. The appearance of the yellow fever in 1793 having thinned the ranks of the profession in Philadelphia, Dr. Dewees was induced to remove thither in December of that year. He entered upon his new field of duty with the confidence, and, it may be stated, under the patronage of Dr. Rush. His associates and competitors for medical practice at the time were Drs. Physick and James, who had just returned from their sojourn abroad. It was at a period of need in the important branch of obstetrics that Dr. Dewees located himself as a practitioner among the citizens of that city. Its condition was not flattering, as Dr. Hodge informs us that "at that period the science was hardly known in America." The physicians who occasionally engaged in its practice had received no instruction, with the exception of a few, who, having visited Europe, brought home a general knowledge of the subject, but who, from the prejudices existing against the employment of male practitioners, had few opportunities and fewer inducements to perfect their knowledge. Hence, midwifery existed almost universally as an art (the aged and imbecile nurse was preferred to the physician), except only so far as it had been taught

by Dr. Shippen and as a mere appendage to the chair of anatomy and surgery, from which it received necessarily but little attention, it was comparatively ignored as a branch of scientific education in the medical school with which Dr. Dewees afterward became so prominently connected. Medical men, therefore, who desired to become proficient in this branch of the profession were under the necessity of visiting Europe, or of relying upon their own resources. To supply the demand for skillful and intelligent assistance in the conduct of labor, Dr. Dewees, with James Church and others directed their attention to this branch, and by rendering themselves especially masters of it, were enabled to communicate their knowledge and experience to others. No one could realize more fully than Dr. Dewees the want of more extensive and efficient instruction on the subject of practical midwifery, and to use the words of the late Prof. Hodge "we find that he had the high honor of first attending a full course of lectures on obstetrics in America. In a small office he collected a few pupils, and in a familiar manner indoctrinated them with principles of this science, toiling year after year in opposition to the prejudices not only of the community but even of the profession, who could not perceive that so much effort was necessary for facilitating the natural process of parturition." In 1806 Dr. Dewees received the degree of doctor of medicine from the University of Pennsylvania. His thesis on this occasion was on "The Means of Moderating or Relieving Pain during Parturition." This essay was afterwards expanded and published as a book, which added to the reputation of the author. When, in 1810, it was determined to erect midwifery to an independent position in the university, Dr. Dewees became a candidate for the chair. The struggle, we are told, was a warm one, and the claims of opposing candidates and the influence of their respective friends rendered the event doubtful. "The strong claims of Dr. Dewees, his talents, his industry, his attainments, his dexterity, boldness, decision and judgment as a practitioner, his great success in the practice of his art; his popularity, supported by the strongest testimonials from many of the distinguished men in the profession, including Drs. Rush and Physick, were met by analogous claims of Drs. James and Chapman." The contest at this time resulted in the selection of Dr. James. In 1812, Dr. Dewees, under the apprehension of a pulmonary affection, retired from the profession and became a farmer. This change did not result to his pecuniary advantage, and he returned to Philadelphia in 1817. In 1825 he was elected to the position of adjunct professor of obstetrics. He had then passed the meridian of life. He was fifty-seven years of age, but his constitution was firm, and his energy untiring. In this secondary post he remained until 1834, when he was elected to the professorship. Dr. Dewees was a voluminous writer; but his best book is his first, his "Compendious System of Midwifery." Although not the first original treatise upon the subject in this country, it attracted the attention of European writers to American authorship. This work was published in 1826, and three editions were issued within the next two years. It deviated from the principles of the English authorities, and while resting upon those of Baudelocque, who was the exponent

of the French school of obstetrics, presented so much of original thought and observation as to bestow a high reputation upon the author. "To an American therefore, the appearance of Dr. Dewees' work on midwifery is an important epoch in the history of our science as being the first regular attempt to think for ourselves on Tokology, and to contribute to the onward progress of this important division of medical science." It was written at the time when his personal influence was unbounded and wielded a sway over the opinions of his contemporaries and pupils which directed their practice and controlled their actions long after his death, and for this reason he may truly be regarded as the father of American obstetrics. He also wrote a "Treatise on the Physical and Medical Treatment of Children," a "Treatise on the Diseases of Females," and one on "Practice of Medicine," all of which were standard in their day, and of which many editions were issued. In November, 1835, the health of Dr. Dewees, which had been much impaired by age and laborious occupation, completely failed from paralysis, and after his second course of lectures had commenced, he was forced to resign and was succeeded in his chair of obstetrics by Prof. Hugh L. Hodge. After spending a winter in Cuba and a summer in the North, he settled in Mobile, but returned to Philadelphia a year before his death.

DICKSON, Samuel Henry, of Philadelphia, Pa., was born in Charleston, S. C., September 15, 1798, and died in the former city March 31, 1872. His father, who was of Scottish descent, emigrated from Ireland before the Revolution and fought in that contest under General Lincoln. Young Dickson was graduated at Yale in 1814, and after studying medicine in Charleston and at the University of Pennsylvania, received his diploma from the latter institution in 1819. He soon established a large practice in Charleston and in 1823 delivered a course of lectures on physiology and pathology in that city before about thirty medical students. He was active in founding a medical college in Charleston, and on its organization in 1824 became professor of the institutes and practice of medicine. He resigned his chair in 1832, but in the following year, on the reorganization of the institution as the Medical College of South Carolina, was re-elected. He was professor of the practice of medicine in the University of New York from 1847 to 1850, but in the latter year resumed his chair in Charleston. From 1858 until his death he held the same chair in Jefferson Medical College in Philadelphia. The University of New York gave him the degree of LL. D. in 1853. Dr. Dickson wrote not only on professional but literary and current topics, and added a graceful style to thoroughness of learning. He published "Dengue, Its History, Pathology and Treatment," 1826; "Manual of Pathology," "Practices of Medicine," "Essays on Pathology and Therapeutics," 1845; "Essays on Life, Sleep, and Pain," 1852; "Elements of Medicine," 1855; and "Studies in Pathology and Therapeutics," 1867. He not only made extensive contributions to medical but to general literature, and published many occasional essays and addresses, including an address before Yale Phi Beta Kappa Society in 1843. On the "Pursuit of Happiness," and a pamphlet on slavery asserting the essential inferiority of the negro race, 1845. Much of his talent ap-

pears to have been inherited by his daughter, Jennie A. Dickson, who has also contributed largely in prose and verse to current literature.

DORSEY, John Syng, of Philadelphia, Pa., was born in that city December 23, 1783, and died there November 12, 1818. He was educated at the Friends Academy, and at the early age of fifteen years commenced the study of medicine with his uncle, Dr. Physick, and was graduated at the University of Pennsylvania in 1802. The trustees, upon application to them, having dispensed with the rule which prohibited the conferring of the degree of M. D. on any one who had not attained the age of twenty-one years, granted him on account of his industry and proficiency, the honors of the doctorate at the age of nineteen. His thesis was upon "The Powers of the Gastric Juice as a Solvent for Urinary Calculi." It was published in the series of Theses edited by Dr. Caldwell. A few weeks after this the yellow fever broke out in Philadelphia and committed such ravages that a hospital was opened and the young graduate received the appointment of resident physician. He combatted the idea of contagion and strengthened his theory regarding the disease by courting infection in the most reckless manner. The next year, 1803, he visited France and England, attended the lectures of Humphrey Davy, the distinguished chemist, and afterwards visited the medical schools of Paris, returning to Philadelphia after an absence of about a year. In 1807 he was chosen adjunct to his uncle in the chair of surgery, University of Pennsylvania, and in that position continued until the decease of Dr. Barton, in 1815, when he was elected to the professorship of *materia medica*. In this position he remained until the spring of 1818, when, by the death of Dr. Wistar, the chair of anatomy was left without an occupant. For this position he was well adapted by education and experience, and was elected to it with universal approbation. While performing the duties of the chair of *materia medica*, Dr. Dorsey published a syllabus of his lectures, but previous to this he had given to the public his "Elements of Surgery" which appeared in 1813. This work, which was adopted as a textbook in the University of Edinburgh, may be regarded as a faithful exponent of the surgery of the day, as it was taught by Dr. Physick, of whose opinions and mode of practice it was the record, and as it was practiced by the author himself, whose position as a surgeon of the Pennsylvania Hospital gave him opportunities for the acquisition of skill and experience. In that institution he tied the internal iliac artery the first time the operation was performed in this country. Dr. Dorsey was well versed in the literature of European surgery, and familiar with its conditions from personal observation. At the time he was elected to the chair of anatomy he was thirty-five years of age, and exhibited all the enthusiasm of a zealous, rightly inspired, ambitious candidate for reputation in the field of enterprise before him. The course was opened, and on November 2, 1818, he delivered his introductory lecture, which, from the portions published, was full of correct sentiments and elevated thought. It was the last delivered by him. In its preparation the seeds of disease were laid which soon terminated his mortal career. The subjoined extracts from this discourse will serve to show how beautifully the newly elected teacher por-

trayed the uses of anatomy before his young auditors and how he would have infused life and vigor into the dead subject as it lay before him on the table in the amphitheater had he been spared to enter fully upon his professional labors. "Placed in a world in which we find ourselves at the head of creation—a little lower than the angels"—but superior, very far superior to all other animated beings which surround us, it is in every respect proper that we should know ourselves, and what was intended by the poet to express the importance of an acquaintance with the mind of man is equally true with respect to his corporeal organs and functions. In every sense, 'the proper study of mankind is man.' Man is justly considered the most perfect animal. He possesses faculties and organs, many of which are peculiar to himself; some, however, he enjoys in common with the brutes, and in some the lower orders of animals surpass him. He can neither soar with the eagle, nor follow the finny tribes through the depths of the ocean. His smell is less acute than that of the greyhound, his sight less piercing than the hawk's. In strength he is surpassed by the elephant, in fleetness by the reindeer. The reasons are obvious—his mental powers render these endowments useless and place them all at his command. He has dominion 'over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the earth.' All are made tributary to his wants and even his caprices. Should it be demanded,

'Why has not man a microscopic eye?'

The answer is a good one—

'For this plain reason—man is not a fly.'

"The various organs which compose the human structure can not be comprehended unless they are very distinctly seen; and for the purpose of exposing them to view, various artifices have been contrived, by which different kinds of organization are rendered obvious. For this purpose the anatomist has recourse to dead bodies, the different parts of which are in succession exhibited and explained. In this species of intercourse with the dead, much violence is done to our natural feelings. An instinctive horror of death seems recognized by the whole human race. It was the curse pronounced on sin; it is a state to which we are all doomed; a state full of mystery, and one which ushers us into new modes of existence, of which we can now have no distinct conceptions—

'Through what variety of untried being,
Through what new scenes and changes
must we pass?'

These are considerations which render it impossible for living man to approach with indifference the confines of the tomb. There are other points of view from which the task appears loathsome and disgusting. To seek for knowledge 'mid skulls and coffins, epitaphs and worms;' to behold the changes which the fair frame of beauty is destined to suffer; the ruddy glow of health changed to the dim hue of putrefaction—

'Whilst surfeited upon the damask cheek,
The high-fed worm, in lazy volumes rolled,
Riots unscared;'

To contemplate the lifeless carcase when deserted by the soul and reduced to 'a clay clod lump,' is surely enough to excite sensations of disgust and horror; and yet, gentlemen, these

are the objects to which the anatomist invites you; with them you must learn to be familiar. The anatomist has no field for display of fancy; with him every subject is detailed as plain matter of fact. No oratorical displays of rhetoric or eloquence can aid him to enliven your attention; his eloquence is of the hand; his rhetoric of the scalpel! But when years shall have rolled away and when your memory shall be tasked to recall the vestiges of scholastic learning, when your teacher's tongue shall be silent and his hand motionless, then the impressions derived through the medium of your senses will be found fresh and vivid, long after the collections of impassioned oratory shall have faded from your minds. And now, gentlemen, I beg leave for a moment to call your attention from the subject, to those who have taught it. The professorship to which I have been elected in this school was originally founded by the exertions of Dr. William Shippen, a gentleman in whom were combined, in a remarkable degree, the varied talents necessary to form a teacher. His descriptive powers and fascinating eloquence riveted the attention of his pupils, and impressed with indelible force the lessons he inculcated. His successor (Dr. Caspar Wistar) is fresh in the recollection of most of those whom I have the honor to address. With devotion to his arduous duties, he founded for himself a character of such unsullied excellence that envy itself would in vain attempt to tarnish its lustre. Learned, accomplished and amiable, he was master of his subject, and master of his pupils. Their feelings and their intellects acknowledged his sway; these he enlightened by the purest rays of science, and those he captivated by the unaffected benevolence of his heart. He was not one of those described by a late writer, 'professors enjoying the admiration of their young pupils, assuming a decided and dictatorial character, affecting to have gone to the bottom of everything and to have overcome every difficulty, either by the natural powers of their own minds, or by severity of study and perseverance in the pursuit of knowledge.' No! he was modest, and whenever doubts and difficulties existed, he acknowledged them, and 'if truth lay beyond his reach, he confessed his ignorance with a decent and becoming sense of the imperfections of human nature.' Were I to attempt a sketch of his method of teaching, I should say that its striking feature was extreme solicitude to force upon each of his pupils a knowledge of his subject and an utter disregard to every meretricious method of enhancing his own reputation by obtrusive displays of his learning or accomplishments. Happy had it been for you, gentlemen, happy for the University of Pennsylvania, and happy for the interests of science if his life had been prolonged till some successor, worthy of such a station, had been raised to take his place. The present incumbent is well aware that much strength must be necessary to flex the bow of Ulysses; yet he ventures without affectation of diffidence to attempt it, and not without a hope that at a future day he shall have achieved by diligence some better claims to his present distinction. All he can even promise is his honest, zealous and unremitting effort to discharge those duties, heretofore performed by men whose memories are embalmed in the heart of every votary to medical science and whose glory, no longer in its zenith, still

casts some lingering beams around the horizon, once illuminated by their noontide splendor." The personal popularity of Dorsey was very great. "The warmth of his manner, his kind and genial disposition, his enthusiasm, the charm which he threw around his subject, his well-known honesty and the uncommon interest which he evinced in the instruction of his pupils, all conspired to render him the idol of his classes, both public and private. After his death his private students, of whom he always had a large number, united in a subscription to defray the expenses of a portrait, painted by Thomas Sully, and engraved by Goodman & Pigot, as a memorial of their beloved preceptor. The likeness, which is said to have been a very correct one, represents Dorsey with a large white cravat and ruffled shirt, with a black coat, the collar of which was of enormous dimensions, strikingly in contrast with the narrow cervical apology worn at the present day. In person Dorsey was eminently handsome. He was of medium height, with a decided tendency, a few years before his death, to corpulency. His features were broad and intellectual, his nose prominent, his lips large, and his chin well rounded off. The eyes were blue and sparkling with intelligence, the forehead was ample, and the hair, which was somewhat brownish, fell negligently in a large cue over his collar, in accordance with the fashion of the times. The impediment in his speech, contracted in early life, if, indeed, it was not congenital, was, as has been already seen, perfectly overcome long before he died. His mind was evidently of a high order and well stored with varied knowledge. His conversational powers were remarkable. No one approached him without being fascinated; and, on convivial occasions, he was the life and soul of the company. He had a decided taste for music, which he cultivated with much ardor in early life, and for which he always cherished a warm regard. It was said that he could perform well on several instruments. He also evinced a marked partiality for poetry, but it is not known that he has left anything, except some fugitive pieces, of special merit or interest, in this department of literature, for the cultivation of which the arduous duties of a practitioner's life seldom afford any leisure. As a draughtsman he possessed unusual talent, and could he have indulged his tastes and inclination, it is more than probable that he would have attained to distinguished eminence as a painter and an engraver." It has been stated that he alone supplied the plates for his work on surgery; and several landscapes, still in the possession of his descendants, attest the power of his brush. With a mind so versatile, so susceptible to the beauties of nature, it was not surprising that he should have been passionately fond of music, poetry, and the fine arts. Rich in knowledge, eminently self-possessed and fertile in resources, aided by a retentive memory and a fluent elocution, there were few men among Dorsey's contemporaries who could successfully cope with him in debate or in the systematic discussion of a professional topic. His displays before the Philadelphia Medical Society, comprising many of the master-spirits of the day, were generally highly creditable and effective efforts. "As a debater," says Dr. Chapman, in his eulogy delivered before the medical class, in 1819—a gentleman who knew him

well and intimately, and who loved him as a brother—"he never had a superior among us. The style of his speaking was peculiar and distinctive. Destitute of rhetorical pretensions, it had the character of warm and elevated conversation, and while it was sufficiently strong to cope with the most powerful, it was intelligible by its simplicity to the meanest capacity. Equally adroit in attack or defense, the resources he exhibited in these contests, and especially when pressed by the weight of an adversary, were surprising, and often drew forth strong expressions of admiration and applause. It has been objected to his speaking that, though always ingenious and forcible, it was occasionally loose and desultory. But this defect was visible only in those *ex tempore* effusions, which escaped from him without premeditation or reflection, and proceeded in great measure from the fecundity of his genius, and the copiousness of his matter. Teeming with ideas, and exuberant in facts, he could not always preserve his arrangement, nor the chain of his reasoning, perspicuous and consecutive." As a surgeon, considered in the more lofty sense of that term, his ability shone forth with peculiar luster. Eminently conservative in his practice, he never hesitated to employ the knife, when he found he could no longer rely upon his therapeutic resources, and it was upon such occasions that he evinced the highest talent in the art of the operator. Endowed with a firm and vigorous mind, thoroughly acquainted with relative anatomy, and early habituated to the sight of blood, he went about his task with an unflinching eye, and a hand that never trembled, however trying the occasion, or unexpected the emergency. In short, he was a brilliant operator, and an honest, conscientious surgeon and medical practitioner, doing nothing merely for the sake of doing it, but always for a definite object. With the exception of Physick and of Post, the one the leading surgical authority at that time in Philadelphia, and the other in New York, he had no rival as an operator in the country. Mott was then just merging into reputation, full of the promise that was within him, but it was not until after his young, ardent, and accomplished contemporary had been gathered to his fathers, that it reached its culminating point. His immortal operation upon the innominate artery, which convulsed the surgical world, was performed only a few months before Dorsey's death. As has been stated the last illness of Dorsey was sudden and violent. On the evening of the same day that he delivered before his class, in the presence of his colleagues and the trustees of the University of Pennsylvania, an introductory to his course of lectures on anatomy abounding as already seen in passages of extraordinary beauty and eloquence, uttered with unwonted fervency, and while the praises which it elicited from his auditors were still resounding from their lips, he was struck down by that disease which was destined to consign him to an untimely grave. The attack was one of typhus fever, and such was its violence that in ten days from its commencement it closed his existence, leaving us only his enviable name and his inestimable example. This sad event created much excitement throughout his city as well as throughout the whole American medical profession. It was regarded as a public calamity, that one so young, so

promising, and so full of talent and ambition, should be cut off in the vigor of his manhood and in the midst of his usefulness. Philadelphia had lost one of her most valued and popular practitioners; and the long train of mourners, as they carried the mortal remains to their last resting place, attested their appreciation of his worth in heart felt sobs and sighs, such as the good and virtuous alone merit and receive when called away from the scenes of their earthly labors. One of his biographers states that Dorsey's mind was early imbued with religious feelings which no doubt exercised a most salutary influence upon his career as a man, a practitioner, a teacher, and a citizen, and that shortly before he expired, he observed: "I hope to live and to remain with my family, but my desire to be with Christ is far greater." Referring to the death of the subject of this memoir the late Prof. S. D. Gross in his American Medical Biography has said that at the time of its occurrence he was universally regarded as one of the most able, talented and promising members of the medical profession that America had yet produced. The event was so much the more deplored because of his many excellent social qualities and his remarkable personal popularity, as well as of his rapidly increasing fame and usefulness, to say nothing of the fact that he had just been elevated to one of the most honorable positions in the school in which fifteen years previously he had received his medical degree. Had he been spared to the age ordinarily allotted to the more favored portion of the race, he would, doubtless, have earned an undying fame as a great surgeon; for he unquestionably possessed all the attributes of a superior mind, blended with the accomplishments of a varied, if not a profound scholarship, and he was, next to Physick, the very man to whom above all others, the public everywhere looked as best qualified by nature, education and opportunity, to illustrate the character of the art and science of surgery, in the first third of the nineteenth century in the United States.

DOUGLAS, George, of Oxford, N. Y., was born at Franklin, Delaware county, that State, May 7, 1823. His father was a lawyer, who practiced in the State courts and also the United States supreme court. The paternal ancestors of the subject of this sketch, were direct descendants of the celebrated William Douglas of Scotland, the progenitor of the "Good Sir James of Douglas," who perished in Spain in 1330, while on a journey to the Holy Land with the heart of Robert Bruce. His family coat of arms is that of the Earls of Angus. His academic education was acquired at the Delaware Literary Institute, New York, his medical studies in the Geneva Medical College and at the University of New York, where he graduated M. D. in 1845. He commenced the practice of his profession at Oxford, Chenango county, N. Y., in 1846, doing, in the commencement, what was then considered remarkable feats in surgery, and entered at once upon a large and lucrative practice. During the late Civil War he was appointed surgeon of the examining board of the nineteenth district, State of New York. In 1858 the doctor was united in marriage to Ada E. Frink, of Onondaga county, N. Y. After her death, which occurred in but little more than four years, he married, in 1866, Jane A. Mygatt, daughter of the distinguished financier, Will-

iam Mygatt, of Oxford. He has but one child living, Ellen Douglas. In 1877 he retired from the active labors and responsibilities of his profession, and has since spent much of his time in travel, having twice traveled through most of the European countries, visiting its hospitals, and all of the States and Territories, together with all the principal cities of this country and of Canada. He is a member of the New York State Medical Association, and for twenty-two years of the American Medical Association, an honorary member of the California State Medical Society, also member of the Ninth International Medical Congress at Washington, D. C., and was a delegate from the National Medical Association to the World's Medical Congress at Berlin, Germany, 1890. A paper descriptive of this Congress was read before the members of the New York State Medical Association, 1891, favorably commented upon, and published in the

George Douglas.

Transactions of that year. He is a member of the Rocky Mountain Medical Association, and in 1892 was elected president of this organization. Dr. Douglas was also a delegate from the American Medical Association to the Eleventh World's Medical Congress, which met September 24, 1893, at Rome, Italy.

DOUGLAS, John H., of New York City, was born in Waterford, N. Y., in 1824, and died in Washington, D. C., October 2, 1892. He graduated M. D. at the University of Pennsylvania in 1847. He was a resident of New York during the greater part of his professional life, engaged in a specialty of diseases of the throat and lungs. He was General Grant's physician during the last painful illness of that eminent American. Dr. Douglas was unremitting in his services, and found it expedient, after the death of the General, to go to Mexico on a recruiting excursion. He went to Cuba and Florida also, but he seems not to have

been benefited by the southern climate influences. His health was still further broken in 1890 by a cerebral hemorrhage, and a second stroke was experienced by him in Washington, about a fortnight before his death. An unpleasant discrepancy, some of the discussion of which was worked over in the newspapers, arose between the survivors of the General and Dr. Douglas regarding the latter's fees. This was arranged, if not placated, by the payment of about \$12,000 for services covering the greater part of ten months. Some of these services were exclusive, the class of all others concerning which there is the greatest room for disagreements and subsequent litigation. The last four years of Dr. Douglas' life were spent in retirement, chiefly in the vicinity of New York and in Washington. Without doubt, under some forms of government, having more of gratitude than republics, Dr. Douglas would have been, in his latter days, in the receipt of a comfortable pension, as the constant care of his patient broke down his constitution, and in addition to his two strokes of paralysis, he is said to have for some time suffered from the same kind of cancer that caused the death of General Grant.

DOUGLAS, Orlando Benajah, of New York City, one of seven children and the eldest son of Amos and Almira (Balcom) Douglas, was born September 12, 1836, in Cornwall, Vermont. His great grandfather, James Douglas, removed from Connecticut in 1784, and was one of the first settlers in Cornwall. He descended from the New London family of Dea. Wm. Douglas, born in Scotland, 1610, and removed to Boston, Mass., in 1640. Dr. Douglas received his early education in the common schools, and later in the Vermont Literary and Scientific Institute, at Brandon, the birth-place of a distinguished relative, Stephen A. Douglas. In 1854, he taught school in Orwell, and subsequently in adjoining towns. He is a Baptist, and was active in the work of the Young Men's Christian associations, Sunday-schools, and temperance. In the fall of 1858, after his mother's death, he went to Brunswick, Mo., where an uncle resided, and began the study of medicine, which he pursued nearly three years and until the great Civil War began. Though living in town with, and a friend of General Sterling Price, he could not accept the doctrine of "States Rights," and, with five friends, enlisted in the 18th Regiment Missouri Volunteers for the United States service. He was offered a captaincy, which he declined, feeling that his military education did not warrant its acceptance, but later received a commission as lieutenant, was appointed adjutant, and subsequently acting assistant adjutant-general. His regiment was on duty in north-west Missouri, at Island No. 10, Pittsburgh Landing, Corinth, and finally went with Sherman through Georgia to the sea. Dr. Douglas was twice wounded in the service, suffered illness from exposure, and was honorably discharged in February, 1863, but was afterward in government service a year and a half, at Concord, Mass. He began practice in New York City, in the spring of 1877, having graduated from the University Medical College. In October, he was appointed assistant surgeon to Manhattan Eye and Ear Hospital, throat department, where he has since labored unremittingly. In 1885, he was made surgeon and director of that hospital; and has been an ac-

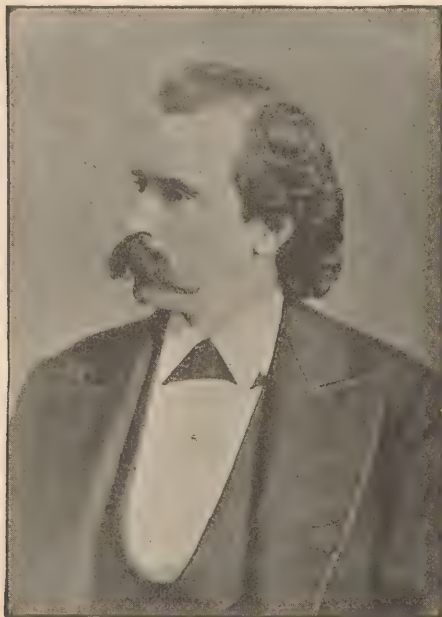

tive promoter of the wonderful improvements made in treating catarrhal affections. The system he adopted for classifying and treating patients is unique and most excellent. In 1878, he did the work mostly alone, but his clinics in this hospital now require fourteen trained assistants. He had two years' service in the out-door department of De Milt Dispensary, and for ten years had a good obstetrical and general practice. This he relinquished, and has devoted his time wholly to diseases of the nose, throat and ear. In 1888, he was elected Professor of Diseases of the Nose and Throat in the Post-Graduate Medical School and Hospital, which he still holds. From 1879 to 1887, he was treasurer of the Medical Society of the City and County of New York, and in 1890 was elected its president. He has been secretary of the Therapeutical Society of New York;

O. B. Douglas.

chairman of the section on rhinology and laryngology in the New York Academy of Medicine; treasurer of the academy since 1889; secretary of its committee on admissions; director of the New York Physician's Mutual Aid Association ten years; member of the State Medical Society of New York; honorary member of the Vermont Medical Society. He has visited nearly every capital and principal city of Europe, and studied their hospitals and clinical methods. Dr. Douglas is surgeon of Reno Post, Grand Army of the Republic; companion of the First Class of the Loyal Legion of the United States; member of the Masonic Fraternity; Fellow of the American Geographical Society, and of other associations. It is truthfully said of him that he never sought position, asked for promotion, or solicited votes to elect him to any office. He has one son, Edwin Rust Douglas, born in 1872.

DOYLE, Gregory, of Syracuse, N. Y., was born at Killena, County Wexford, Ireland, March 28, 1840. His parents came to this country when he was but a year old. His early education was received at St. James's Academy, Binghamton, N. Y. After pursuing a thorough classical course at Niagara University he took up the study of medicine and surgery at Bellevue and University Medical Colleges, New York, from the latter of which he graduated in 1865. During his studies and for a long time after graduation he was a valued assistant to the eminent surgeon, Lewis A. Sayre, of New York. The many advantages enjoyed by this fortunate association rapidly developed his natural adaptability for surgical work. After leaving New York City he practiced for a short time in Binghamton and

Gregory Doyle

Albany, and finally settled permanently in Syracuse, N. Y., where he now enjoys an extensive surgical practice. He has contributed numerous articles on orthopedic surgery and other subjects to various journals. On November 16, 1880, he read a paper before the New York Central Medical Association, in which he recommended the dressing of Colle's fracture and fractures of the leg with plaster of paris splints, made in sections that could be easily changed or removed without pain or injury to the limb. The paper was soon after published in the *International Journal of Medicine and Surgery*, at that time published in New York. An English surgeon published an article on the same subject about two years subsequently as something new in dressings. Dr. Doyle invented the Spiral Spring Rotator for the automatic eversion or

inversion of talipes and illustrated its use before the American Medical Association at New York in 1880. Many other orthopedic appliances owe their origin to him. He is a permanent member of the American Medical Association, the Central New York Medical Association and the Onondaga Medical Society, also ex-president of the Syracuse City Medical Society. He was appointed president of the United States examining board for pensions at Syracuse, N. Y., which position he held during Cleveland's administration. He was official surgeon of the Buffalo, New York and West Shore Railroad from its inception until about a year ago, when he was obliged to relinquish it as the work interfered too much with his private practice. The House of Providence and St. Vincent's Asylum appointed him many years ago their surgeon, in which capacity he has tendered his services gratuitously ever since. Dr. Doyle has made two extensive trips through Europe and has improved the opportunity by visiting several noted foreign institutions of learning. For years he has confined himself almost entirely to surgery, and believes in the doctrine that it is often very good surgery to know when not to operate as well as when to operate, and for that reason he has had gratifying success in his profession. Dr. Doyle was married in 1868 to Urania Morel, the accomplished daughter of Justin Morel, a leading merchant of St. Louis, Missouri.

DRAKE, Daniel, of Cincinnati, Ohio, was born in Plainfield, N. J., October 20, 1785, and died November 6, 1852. His father moved to Kentucky when the subject of this sketch was about two years of age, and established his residence at Mayslick, a new settlement, consisting of a small colony of New Jersey people with a few stragglers from Virginia and Maryland, whose occupation was clearing the forest and cultivating the soil. Referring to this event and the subject of this memoir, the late Dr. S. D. Gross in his *American Medical Biography* says: The log cabin of that day, the residence of the Drake family, constituted an interesting feature of the landscape. As the name implies, it was built of logs, generally unhewn, with a puncheon floor below, and a clapboard floor above, a small square window without glass, a chimney of "cats and clay," and a coarse roof. It consisted generally of one apartment, which served as a sitting room, dormitory, and kitchen. The ancestors of Dr. Drake, although poor and illiterate, possessed the great merit of industry, temperance, and piety. Both his grandfathers lived in the very midst of the battle scenes of the Revolution; one of them, Shotwell, was a member of the Society of Friends, and was, of course, a non-combatant, while the other, who had no such scruples, was frequently engaged in the partisan warfare of his native State. The father of Dr. Drake died in Cincinnati in 1832, the mother in 1831, both at an advanced age. The first fifteen years of young Drake were spent at Mayslick, in the performance of such labors as the exigencies of his family demanded. In the winter months, generally from November until March, he was sent to school, distant about two miles from his father's cabin, while during the remainder of the year he worked upon the farm, attending to the cattle, tilling the soil, and clearing the forest, an occupation in which he

always took great delight. This kind of life, rude as it was, and uncongenial as it must, in the main, have been to his taste, was not without its advantages. It eminently fitted him for the observation of nature, so necessary to a physician. Nothing escaped his eye. Nature was spread out before him in all her diversified forms, and he loved to contemplate her in the majestic forest, in the mighty stream, now placid and now foaming with anger, in the green fields, in the flowers which adorn the valley and the hill, in the clouds, in the lightning and thunder, in the snow and the frost, in the tempest and the hurricane. It had another effect. While it had the disadvantage of preventing him from pursuing a steady course of literary culture, and fitting him for the early practice of medicine, it excited in him habits of industry and attention to business, teaching him patience and self-reliance, and giving him an insight into many matters, to which the city trained youth is a stranger. Finally, the physical labor which he underwent there served to impart health and vigor to his constitution, and thereby contributed to produce that power of endurance which he possessed in a degree superior to that of almost any other man of his time. But the settlement of Mayslick was not without its charms and enjoyments. To the young and imaginative mind of Drake, every little spot in the landscape was invested with peculiar beauty and interest. What to an ordinary observer was barren and unattractive, was to him a source of never failing gratification. In the spring and summer, the surface of the earth was carpeted with the richest verdure, and embellished with myriads of wild flowers, which, while they rendered the air redolent with fragrance, delighted the eye by their innumerable variety. The trees, those mighty denizens of the forest, were clothed in their most majestic garb, adding beauty and grandeur to the scene, enlivened by the music of birds, which thronged the woods, and constituted, along with the merry and frolicsome squirrel, the familiar companions of the early settler. The scholastic advantages of young Drake, during his residence here were, as already hinted, very limited. The teachers of the place were itinerants, of the most ordinary description, whose function it was to teach spelling, reading, writing, and ciphering, as far as the rule of three, beyond which few of them were able to go. The fashion in those days was for the whole school to learn and say their lessons aloud; a practice commended by Dr. Drake in after life, as a good exercise of the voice, and as a means of improving the lungs and disciplining the mind for study in the midst of noise and confusion. His first teacher was a man from the eastern shore of Maryland, an ample exponent of the state of society in that then benighted region. The school-house in which he was educated was fifteen by twenty feet in its dimensions, and one story high, with a wooden chimney, a puncheon floor, and a door with a latch and string. In the winter, light was admitted through oiled paper, by long openings between the logs. Glass was not to be obtained. The ordinary fee for tuition was fifteen shillings a quarter. During his sojourn under his father's roof, he was a close observer of the people around him, residents as well as emigrants, the latter of whom were in the habit of passing in great numbers through the settlement.

He studied their manners and habits, observed their prejudices, noticed and compared their opinions, and thus acquired important knowledge of human nature. Books and book-learning alone do not serve to make up a man's education; he must mingle with the world, and endeavor to derive from its intercourse those lessons of wisdom and practical tact which are to regulate his conduct and beautify his life. Thus it will be seen that his *Alma Mater* was the forest; his teacher, nature; his classmates, birds, and squirrels, and wild flowers. Until the commencement of his sixteenth year, when he left home to study medicine, he had never been beyond the confines of the settlement at Mayslick, and it was not until his twentieth year, when he went to Philadelphia to attend lectures, that he saw a large city. The "Queen of the West," as Cincinnati has since been styled, was then a mere hamlet, with hardly a few thousand inhabitants. Kentucky, at that early day, had but one university, and, although it was hardly fifty miles off, his father was too poor to send him thither. Young Drake was early destined for the medical profession; and in the autumn of 1800, at the close of his fifteenth year, he was sent to Cincinnati, to Dr. Goforth, as a private pupil. The arrangement was that he should live in his preceptor's family, and that he should remain with him four years, at the end of which he was to be transmuted into a doctor. It was also agreed, between the parties, that he should be sent to school two quarters, that he might learn the Latin language, which, up to that time, he had wholly neglected. For his services and board, the preceptor was to receive four hundred dollars, a tolerably large sum, considering the limited means of his father. During his pupilage, he performed, with alacrity and fidelity, all the various duties, which, at that early period of the West usually devolved on medical students. His business was not only to study his preceptor's books, but to compound his prescriptions, to attend to the shop or office, and, as he advanced in knowledge, to assist in practice. The first task assigned him was to read Quincy's Dispensary and grind quicksilver into mercurial ointment; the latter of which, as he quaintly remarks, he found, from previous practice on a Kentucky hand-mill, much the easier of the two. Subsequently, and by degrees, he studied Cheselden on the Bones and Innes on the Muscles, Boerhaave and Van Swieten's Commentaries, Chaptal's Chemistry, Cullen's Materia Medica, and Haller's Physiology. These works constituted, at that time, the text-books of medical students, and the custom of many was to commit to memory the greater portion of their contents. At the close of his studies he formed a partnership with his preceptor; and, in the autumn of 1805, attended his first course of lectures in the University of Pennsylvania under Rush, Wistar, Barton, Physick, and Woodhouse. Returning to the West at the termination of the session, he practiced medicine for a year in Mason county, Ky., near his former home; and then finally settled in Cincinnati. In 1807, he married Harriet Sisson, a granddaughter of Col. Jared Mansfield, surveyor-general of the Northwestern Territory, and afterwards a distinguished Professor in the Military Academy at West Point. This lady possessed elegant manners, unusual personal beauty, and a vigorous understanding.

The union was a most congenial and appreciative one; their attachment, founded upon mutual esteem and good deeds, ripened with their years, and by degrees assumed almost a romantic character. In her counsel and sympathy Dr. Drake found support and consolation in his pecuniary embarrassments and in many of the other trials of his varied and checkered life. He attended his second course of lectures in the University of Pennsylvania in 1815, and was graduated at the end of the session with the compliment, from a member of the faculty, of being a young man of great professional promise! In May, 1816, he returned to Cincinnati and immediately recommenced an active and profitable practice. But this was by no means his only employment. His mind was evidently occupied with various ambitious plans,—professional, commercial, and literary,—all of which were successfully developed in his after-life, and influenced his character and fortune in various ways. A little over a year after he received his medical degree he was appointed to the Professorship of *Materia Medica* in the Medical Department of Transylvania University, at Lexington, and in the following autumn entered upon the discharge of the duties of his chair. In 1819 Dr. Drake founded, at Cincinnati, the Medical College of Ohio, and immediately afterwards organized a faculty, he himself taking the chair of medicine. A course of lectures was delivered to a small class of students, but misunderstandings soon sprung up, and Dr. Drake was expelled from the school by two of his colleagues, he himself being the presiding officer on the occasion. Foiled in his attempt to build up a medical institution at home he was induced, in the autumn of 1823, to re-enter Transylvania University as an incumbent of the chair which he had held six years before. He discharged the duties of this department with rare ability for two years; when he was transferred to the Professorship of Medicine, which he occupied until 1827. Dr. Drake was called, in 1830, to the Professorship of Medicine in the Jefferson College of Philadelphia, then in its infancy, struggling like a young giant for a place among the medical schools of the country. Among his colleagues were two gentlemen whose reputation, then in a gravescent state, became finally, like his own, co-extensive with the American Union. These men were the late Dr. George McClellan and the late Dr. John Eberle; the one an ingenious and adroit surgeon, and the other an able and accomplished physician. Both were excellent teachers of their respective departments, and both, but especially the latter, erudite and successful authors. It is no disparagement to these gentlemen to declare that the backwoodsman not only acquitted himself with great credit, but that, long before the close of the session, he was the most popular professor in the institution. Why Dr. Drake did not remain in Philadelphia is not now known; but the probability is, that he was induced to leave because he found the school not sufficiently remunerative, and because his heart was constantly yearning after his western home. Be this as it may, he resigned his chair early in the spring, and returned to Cincinnati. In the summer of 1835, Dr. Drake conceived the project of organizing the medical department of the Cincinnati College. He had, a short time before, been invited to the chair of Medicine in the Medical

College of Ohio, which he had founded sixteen years previously; but believing that it would be impracticable, in the then existing state of things, to place the institution in a flourishing condition, he deemed it his duty to decline the offer, and to enter at once upon the business of establishing a new school. The first course of lectures was delivered the ensuing winter, to a class of sixty-six pupils. The Faculty consisted of seven members, with Dr. Drake as Professor of Medicine. His colleagues were, Dr. L. C. Rives, the late able and popular Professor of Obstetrics in the Medical College of Ohio; Dr. Joseph Nash McDowell, subsequently of the University of Missouri; the late Dr. John P. Harrison, formerly of Louisville, and, after the downfall of the Cincinnati College, a Professor in the Medical College of Ohio; the late Dr. James B. Rogers, afterwards Professor of Chemistry in the University of Pennsylvania; and the late Dr. Horatio G. Jameson, a distinguished surgeon of Baltimore, and at one time a professor in the Washington College of that city. To Dr. S. D. Gross was assigned the chair of Pathological Anatomy, at that period the only one of the kind in the United States. At the close of the session Dr. Jameson resigned, and was succeeded by Dr. Willard Parker, afterwards the justly distinguished Professor of Surgery in the College of Physicians and Surgeons of the City of New York. During the four years the school was in existence it educated nearly four hundred pupils; the last class being nearly double that in the rival institution—an evidence at once of its popularity, and of the ability and enterprise of its faculty. The school had cost each of the original projectors about four thousand dollars, nearly the entire amount of the emoluments of their respective chairs, during its brief but brilliant career. Dr. Drake did not long continue idle. The Faculty of the Cincinnati College had hardly been disbanded, when he received an invitation from the trustees of the University of Louisville to the chair of Clinical Medicine and Pathological Anatomy. This chair, created with special reference to him, was not only novel in its character in this country, but it labored under the additional disadvantage of being an "eighth chair;" a circumstance at that time without a precedent in the United States. The anomaly was still further increased by the establishment of an aggregate ticket of one hundred and twenty dollars. It was a bold experiment; but the result showed that those who made it had not acted in the matter unwisely. The new incumbent acquitted himself with great ability; the new chair soon became popular, and the rapid increase of the school fully attested the wisdom and the policy of the new measure, which secured to its faculty a man of such enlarged experience and reputation as a teacher. Dr. Drake remained in the occupancy of this chair until the spring of 1844, when, on the retirement of Dr. Cooke, he was transferred to the chair of medicine. He continued to labor in this department with his accustomed zeal and eloquence until the close of the session of 1849; when he sent his resignation to the board of trustees. The winter before he vacated his chair he lectured to four hundred and six pupils, the largest class, up to that time, ever assembled within the walls of any medical institution in the valley of the Mississippi. The prosperity of the University

indeed could hardly have been greater when he left it, although the number of students was somewhat less than the preceding session, and the utmost harmony prevailed in the faculty. Notwithstanding these circumstances, he deemed it his duty to retire. The reason which he assigned for this step was, that he should, in another year, reach the period of life when, by an act of the board of trustees, a professor became superannuated, and he thought it his duty to anticipate this law, notwithstanding the framers of it had, when they learned his intentions, abrogated it in his favor. Soon after his retirement from Louisville, Dr. Drake was invited to the chair of Medicine in the Medical College of Ohio, an appointment which, after some hesitation, he accepted, but which he filled only for one session. In the autumn of 1850, Dr. Drake was recalled to Louisville to the chair which he had vacated eighteen months before. He remained in the school for two sessions, and then finally left it, once more to re-enter the Medical College of Ohio, now reorganized with an abler faculty, and under brighter auspices. It was here, just at the opening of the session, full of hope and expectation about the class and the prospects of the institution, that the hand of death was laid upon him, and that his varied but brilliant career was arrested. The immediate cause of his death was arachnitis, brought on by over-exertion of the brain, by the labor and excitement consequent upon the opening of the session of the Medical College of Ohio. His illness was of short duration; and he departed in the full vigor of his intellectual faculties, having, only a week before his final seizure, lectured and written with his accustomed energy and ability. Having spoken of Dr. Drake as a founder of medical schools and of his connection with various medical faculties, we may, in the next place contemplate him as a philanthropist, a patriot, and a medical author. The subject of public education and morals was always near his heart. He took an active part in the establishment and support of the Western Literary Institute and College of Professional Teachers at Cincinnati, attended many of its meetings, often served upon its committees, and delivered several addresses, replete with wisdom and sound learning. Among these was a very elaborate "Discourse on the Philosophy of Family, School, and College Discipline," one of the best and most able of his many occasional productions. He cherished with a deep and abiding interest all institutions for the diffusion of knowledge, and for the promotion of virtue and piety, as well as all charitable establishments, especially hospitals, lunatic asylums, and schools for the education of the blind and the deaf and dumb. In 1821 he procured the establishment, at Cincinnati, of the Commercial Hospital of Ohio, of which, at the time of his death, he was one of the physicians. The grant was accompanied by an endowment, which has afforded the institution great facilities, and enabled it to diffuse its blessings widely among the poor sick of the city and township of Cincinnati, as well as among the boatmen of the Southwestern waters. Connected with the Hospital was a Poor-house and an Asylum for the Insane; the latter of which, however, proving inadequate to the objects intended, Dr. Drake used every possible exertion, by repeated appeals

to his brethren, and finally to the legislature, to have this portion of the establishment removed, and placed under a separate board. The result was the present noble Institution for the Insane at Columbus, the capital of Ohio. In January, 1834, he made an appeal to the legislature of his adopted State in behalf of the establishment of an institution for the education of the blind, and, early in the following year, he read an able report before the Medical Convention of Ohio, at their meeting at Columbus, on the necessity for hospitals in the valleys of the Mississippi and the Lakes, for the accommodation and relief of those engaged in the commerce of the Southwest, as well as of travelers. Copies of this report were transmitted to the general assembly of Ohio and to the President of the United States, to Congress, and to the Heads of Departments. How far these labors were instrumental in promoting the object in question is not known, but it is certain that Congress soon afterwards authorized the establishment of these institutions, and that they now greet the eye and cheer the spirits of the boatman at numerous points of the Southwest. In 1827 Dr. Drake established the Cincinnati Eye Infirmary. It was modeled after similar institutions in New York and Philadelphia, had a regular board of visitors, and was intended for the reception and accommodation of all classes of ophthalmic patients, the poor as well as the rich, but particularly the former. It was the first attempt of the kind in the Southwest, and, for a time, was remarkably successful. The indigent sick from the city and neighborhood flocked to it daily for advice and treatment, and it speedily attracted persons from abroad. The consequence was that Dr. Drake soon became a distinguished oculist, and acquired no little skill as an ophthalmic surgeon. To the influence of Dr. Drake was due, in an eminent degree, the establishment of the Kentucky School for the Instruction of the Blind, at Louisville. Dr. Drake had always, from an early period of his life, evinced a deep interest in the cause of temperance, unfortunately now so much on the decline. During his residence at Mayslick, the rallying point for many years of the people of the neighborhood on election, parade, and gala days, as well as during court-time, he often had occasion, when yet a mere boy, to witness the deplorable and disgusting effects of the inordinate use of intoxicating drinks, and subsequently, after he had become a student and practitioner of medicine, he could not fail to observe that it was a frequent cause of disease and death, both moral and physical. He saw that it was the source of incalculable mischief, and that it lay at the foundation of nearly all the crimes that degrade and debase society, and reduce man to the level and condition of the animals by which he is surrounded. He saw at work an enemy, which, like "the pestilence that walketh by noonday," silently but effectually destroys the peace and happiness of the domestic circle, which raises the arm of the parent against the child and of the child against the parent, and which fills our infirmaries, poor-houses, and penitentiaries with inmates. In a word, he saw that intemperance was sitting, like a mighty incubus, upon the bosom of society, tainting its very breath, and in some instances, threatening the annihilation of entire families. To such scenes, so well calcu-

lated to rouse his young and philanthropic mind, Dr. Drake could not long remain an idle and unconcerned spectator. He felt that there was a necessity for reform, and like a true Christian and patriot as he was, he vigorously engaged in the work, determined, as far as his time and means would admit, to do his part in arresting an evil fraught with such momentous consequences to the peace and happiness of his fellow creatures. Address followed address, and for a time the pages of his medical journal, the sure and steady medium of communication between him and his professional brethren, were literally teeming with articles upon the subject, dwelling with eloquent emphasis upon the malign and destructive effects of ardent spirits upon the human subject, considered in his moral, physiological, intellectual, and legal relations. In December, 1841, Dr. Drake organized in the University of Louisville, then the medical institute of that city, a Physiological Temperance Society, for the benefit of the members of the medical class, of whom it was exclusively composed. Its object was to investigate the subject of alcoholic drinks, in their effects upon the system, and, incidentally, the abuse of other stimulants and narcotics. The society soon became popular with the pupils; for, in less than a month after its establishment, it had upwards of one hundred members, embracing nearly two-fifths of the entire class. Its meetings were held semi-monthly throughout the session of the school, and its exercises, in which the distinguished and philanthropic founder, who was also its president, always took an active part, consisted in the reading of reports and the delivery of addresses on the nature and composition of the different kinds of liquor and of their effects upon the system in its healthy and diseased condition. The association continued in active operation until the spring of 1849, when, in consequence of Dr. Drake's retirement from the university, it was abandoned. Dr. Drake was a voluminous writer. His contributions to medical journals, in the form of original essays, reviews and bibliographical notices, his temperance lectures and public addresses, would, if collected, form several large octavo volumes. His first attempt at medical or scientific authorship was in 1810, five years after he attended his first course of lectures in Philadelphia, and five years before he became a graduate. It was comprised in a small pamphlet on the "Topography, Climate and Diseases of Cincinnati," where he then resided. Although designed exclusively for his professional and scientific friends, the work soon attracted the attention of travelers in quest of information concerning the West, and thus suggested to him the idea of a treatise, constructed on a similar but much more extended scale. The result was his "Picture of Cincinnati," which soon acquired for him not only an American but a European reputation. In 1827, Dr. Drake projected the *Western Journal of the Medical and Physical Sciences*, the first number of which even under the most propitious circumstances, appeared in April of that year. It is no easy matter, to maintain a public journal of medicine. The difficulties were much greater at that time than at present. Then the West had few writers, and an editor was often compelled, from the paucity of material, to rely mainly upon his own efforts for filling up the pages of

his periodical. Many of the contributions that were sent to the *Western Journal of Medical and Physical Sciences* displayed the most miserable scholarship, and the consequence was that not a few of them had to be entirely rewritten before they could be committed to the hands of the compositor. Copying, transposing, abridging, inverting, retroverting, decomposing and recomposing were a part of the labor and drudgery to which Dr. Drake had to submit in the progress of his enterprise. The interest which Dr. Drake always felt for his profession induced him, in 1829, to begin the publication in the *Western Journal of Medical and Physical Sciences*, of a series of "Essays on Medical Education and the Medical Profession in the United States." The papers appeared in successive numbers of the periodical in question, and were finally, in 1832, collected into a small octavo volume of upwards of one hundred closely printed pages. They are written with the author's wonted vigor of style and display throughout, great sound sense, a discriminating judgment and a profound acquaintance with the topics of which they treat. In 1832 Dr. Drake published "A Practical Treatise on the History, Prevention and Treatment of Epidemic Cholera," which was then desolating Cincinnati and the Western States. The work, forming a duodecimo volume of nearly two hundred pages, was designed both for professional and general use, and comprised an excellent and graphic account of that formidable malady. In 1842, Dr. Drake published in the sixth volume of the *Western Journal of Medicine and Surgery* a paper on the "Northern Lakes as a Summer-Resort for Invalids of the South," which, at the time, attracted much attention from the medical and public press. The article, which had been previously read as an introductory address to his course of lectures in the University of Louisville, was designed to illustrate the advantages offered in the hot season by our northern lakes as a residence to the people of the South, and was founded mainly upon his own observations made the preceding summer in a professional tour of two months. It abounds in beautiful and graphic delineations of the wild and romantic scenery of these great inland seas, of the towns and villages which stud and embellish their banks, of the nature of the climate, the productions of the surrounding country, the battle scenes of the late war with Great Britain, and the character and mode of life of the inhabitants, themselves a subject of study for the painter, the poet and the philosopher. There are few tracts of the same size in the English language on the subject of travel which contain so vivid, gorgeous and life-like an account of the countries to which they relate. Nothing seems to have escaped the observation of the author. At one time his mind is dazzled and almost bewildered by a vast, dark and impenetrable forest; at another, by the silvery and unruined surface of a broad and unfathomable lake, reflecting the variegated and fantastic tints of the sky, or bearing upon its bosom the mighty steamboat and the canoe of the adventurous Indian, the Canadian trapper, or the holy and self-denying missionary; now, by some lofty and majestic cliff, rearing its head into the clouds, and serving as a monument for the works of God; and anon, by the bewitching beauties of the setting sun as his rays sport

upon the heavens above, or paint, in all the gorgeous colors of the rainbow, his image upon the waters below. The latest of the mine of productions of Dr. Drake's pen was a small volume of "Discourses" delivered, by appointment, before the Cincinnati Medical Library Association in 1852. It is comprised in a small duodecimo volume, and is divided into two parts, the first of which treats of the early medical times in Cincinnati, and the other of medical journals and libraries. Few medical men, indeed, few men of any profession, will rise from the perusal of this unpretending little volume without feeling that they have been both interested and instructed. The first part, giving an account of the pioneer physicians of the "Queen of the West," and of the prominent men and scenery of that early period, possesses all the charm and interest of a romance, in which the author, while he exhumes his predecessors and contemporaries and places them in life-like colors before the eyes of his readers, forms a conspicuous feature. But the most splendid exhibition of his genius is in his work on the "Diseases of the Interior Valley of North America," an enduring monument of his industry, his research and his ability. Upon this production, which, unfortunately, he did not live to complete, he spent many of the best and riper years of his life. As early as 1822, in an appeal to the physicians of the Southwest, he announced his intention of preparing it and solicited their co-operation. His object, as stated in his circular, was to furnish a series of essays upon the principal diseases of this region of America, derived from his own observation and from that of his friends, and forming, when completed, a national work. Various circumstances conspired to delay the appearance of the work. The author's time in the winter season was much occupied in teaching and in matters growing out of his official relations. Medical schools were obliged to be erected and fostered. Besides, he was the editor of a medical journal, to the pages of which he was often the chief contributor, and he was also frequently compelled to deliver public addresses, which consumed much of his leisure. His facility as a public speaker was too well known in the community to permit him to remain unoccupied. The objects concerning which he was called upon to address his fellow-citizens were often of a benevolent character, and he had too much good nature to resist them, however much they might encroach upon his more legitimate pursuits and the great aim of his life. In 1837, fifteen years after the publication of his circular, he found, for the first time, sufficient leisure to enter vigorously upon the collection of materials for his long contemplated work. In the summer of this year, accompanied by his two daughters, he visited a portion of the South for that purpose, during a tour of about three months. In 1843 he made a second tour, embracing Louisiana, Florida, Mississippi, Alabama and the Gulf of Mexico, and subsequently he explored the interior of Kentucky, Tennessee, the two Carolinas, Virginia, Western Pennsylvania, New York, Illinois, Indiana, Michigan, Iowa, Wisconsin, Missouri, the great lakes and Canada. Wherever he went his fame preceded him and he was kindly received by his professional brethren, many of whom vied with each other to show him attention and

hospitality. It was during his absence upon these missions, which he performed with the zeal of an apostle of science, that he wrote those numerous and interesting traveling editorials, as he styled them, for the *Western Journal of Medicine and Surgery*. These epistles, which form so conspicuous a feature of that periodical during the time referred to, were usually descriptive of the manners, habits and diseases of the people among whom he wandered, of the climate, scenery and productions of the country, and, in short, of whatever seemed at the moment to strike his fancy or interest his mind. The materials thus collected were gradually digested and arranged and finally presented to the profession in the summer of 1850, under the elaborate title of "A Systematic Treatise, Historical, Etiological and Practical, on the Principal Diseases of the Interior Valley of North America, As They Appear In the Caucasian, African, Indian and Esquimaux Varieties of Its Population." The work is illustrated by numerous charts and maps and was published at Cincinnati under the author's immediate supervision. A second volume, the composition of which was in an advanced state at the time of his decease, was afterwards issued under the joint care of Dr. Hanbury Smith, of Ohio, and Dr. F. G. Smith, of Philadelphia, and is entirely devoted to subjects on practical medicine. The two together constitute a monument of the genius and industry of their author, as durable as the mountains and the valleys, whose medical history they are designed to portray and illustrate. The toil and labor expended upon their production afford a happy exemplification of what may be accomplished by the well-directed and persistent efforts of a single individual, unaided by wealth and unsupported by the patronage of his profession. To his other accomplishments he added that of a poet. Several of his pieces, composed during the hours of relaxation from his professional pursuits, possess much beauty and sweetness. They generally partook either of the humorous or of the solemn and pathetic. Dr. Drake was a man not of one, but of many characteristics. His very look, manner, step and gesture were characteristic; they were the outward signs of the peculiar nature within. His conversation, his voice and modes of expression were characteristic—all tending to stamp him, in the estimation and judgment of the beholder, as an extraordinary personage. "His mind was quick, grasping, far-seeing; he acquired knowledge with great facility, sometimes almost intuitively, and readily perceived the relations and bearings of things. Imbued with the true spirit of the Baconian philosophy, he delighted in tracing effects to their causes, and in unravelling the mysteries of science and knowledge. He was a keen observer, not only of professional matters, with which his daily studies brought him into more immediate contact, but of society and the world at large. Added to all this, he had a retentive memory, extraordinary powers of analysis, profound ratiocination, and great originality, with industry and perseverance seldom combined in the same individual. He possessed, in short, all the attributes of a great and commanding intellect, capable of vast exploits, and the accomplishment of great designs. His executive powers were extraordinary. Nowhere did this intensity exhibit itself in a more striking manner, or

in a greater degree, than in the lecture-room. It was here, surrounded by his pupils, that he displayed it with peculiar force and emphasis. As he spoke to them, from day to day, respecting the great truths of medical doctrine and medical science, he produced an effect upon his young disciples, such as few teachers are capable of creating. His words dropped hot and burning from his lips, as the lava falls from the burning crater, enkindling the fire of enthusiasm in his pupils, and carrying them away in total forgetfulness of everything, save the all-absorbing topic under discussion. They will never forget the ardor and animation which he infused in his discourses, however dry or uninviting the subject; how he enchained their attention, and how, by his skill and address, he lightened the tedium of the class-room. No teacher ever knew better how to enliven his auditors; at one time with glowing bursts of eloquence, at another with the sallies of wit, now with a startling pun, and anon with the recital of an apt and amusing anecdote; eliciting, on the one hand, their admiration for his varied intellectual riches, and, on the other, their respect and veneration for his extraordinary abilities as an expounder of the great and fundamental principles of medical science." "Of all the medical teachers whom I have ever heard," writes Gross, "he was the most forcible and eloquent. His voice was remarkably clear and distinct, and so powerful that, when the windows of his lecture-room were open, it could be heard at a great distance. He sometimes read his discourse, but generally he ascended the rostrum without note or scrip. His fluency and facility of language gave him great advantage as a public debater. To his ability as a profound reasoner, he added subtlety of argument, quickness at repartee, and an impassioned tone and style, which rarely failed to carry off the palm in any contest in which he was engaged. Dr. Drake always manifested extraordinary interest in the moral training of medical pupils. Sensible of the temptations which constantly beset their path and allure them from their duty, he took special pains, at the opening of every session of the different schools with which he was, from time to time, connected, to point out to them their proper position, and to warn them of their danger. As a means of promoting this object, as well as of advancing the respectability of the profession, he delivered, while a professor in the Cincinnati College, for several winters, a series of Sunday morning discourses to the students of that institution, on medical ethics, the *morale* of the profession, and the virtues and vices of medical men, embracing their duties to their patients, to the community, and towards each other. These addresses were usually attended by large numbers of the citizens of Cincinnati, and they exerted a wide and happy influence upon the youths for whom they were more especially prepared. He had a decided taste for the society of the young men of his profession, and always evinced a deep interest in their prosperity. The instances were not few in which he labored to advance the welfare of young men, some of whom have since risen to deserved distinction." His own standard of medical knowledge was of the most elevated nature. No one understood better than he the importance of a thorough education, and of a

well-disciplined mind. His own early deficiencies, ever present and ever recurring, had made an impression upon him, which nothing could efface. His occupation as a teacher of medicine had brought him, for years, in daily contact with men and youths, who were not only destitute of preliminary education, but absolutely, from the want of opportunity and mental capacity, utterly incapable of acquiring any. This state of things, so prevalent and deplorable, he often lamented to his friends and colleagues, while he never failed, on all proper occasions, to assail it in his writings and prelections. The difficulty under which a teacher labors in impairing instruction to such pupils, and preparing them for the successful exercise of their high and responsible duties, as practitioners, can be more easily imagined than described. His daily experience in the lecture-room showed Dr. Drake how much of the good seed that is there sown falls upon barren soil, or how, instead of producing good fruit, it yields nothing but tares and thorns. Such was his feeling upon this subject that he often expressed himself as being almost ready to abandon teaching forever. Like many others, he perceived the remedy, but was unable, from the want of co-operation, to apply it. Poor as he was, he would a thousand times rather have lectured to a hundred intelligent and well-prepared young men, than to five hundred ignorant and ill-prepared. His object was not the acquisition of gain, but the desire to be useful and profitable to those whom it was his duty to instruct in the great principles of the healing art. Of quackery, in all its forms and phases, he was an uncompromising enemy. He loved his profession and the cause of truth too well to witness, without deep solicitude, its impudent and unhallowed assaults upon the purity and dignity of medicine considered as a humane, noble, and scientific pursuit. Hence, he permitted no suitable opportunity to pass without rebuking it, and holding up its advocates to the scorn and contempt of the public. In common with many of his brethren, he deprecated its unblushing effrontery, and regretted the countenance and support which it derives from a thoughtless clergy and an unscrupulous and unprincipled press. He saw that it was an evil of great magnitude, threatening the very existence of our profession; and, as a journalist, he deemed it his duty to bring the subject frequently and prominently before his readers, intreating their aid and co-operation in suppressing it. He was the founder of no new sect in medicine. For such an enterprise he had no ambition, even if he had been satisfied, as he never was, of its necessity. He found the profession, when he entered it, at the dawn of the present century, steadily advancing in its lofty and dignified career, refreshed, and, in some degree, renovated, by his immediate predecessors, and his chief desire was to engraft himself upon it as an honest, conscientious, and successful cultivator. How well he performed the part which, in the order of Providence, he was destined to play, in this respect, the medical world is fully apprised. No man was more sensible than he of the imperfections and uncertainties of the healing art, and no one, in this country, in the nineteenth century, has labored more ardently and zealously for its improvement. For the systems of the schools no physician and

teacher ever entertained a more thorough and inimitable contempt. He was an Eclectic in the broadest and fullest sense of the term. His genius was of too lofty and pervasive an order to be trammelled by any authority, however great, respectable, or influential. It was Nature and her works which he delighted to study and to contemplate. Not that he regarded with indifference whatever was good and valuable in the productions of others, but simply because he preferred to drink at the fountain rather than at the turbid stream. Like Hippocrates and Sydenham, he was a true observer of Nature, and, we may add, a correct interpreter of her phenomena and her laws; his ambition was to be her follower during life, and at his death to leave a record, a true and faithful transcript, of the results of his investigations for the benefit of his brethren. In his intercourse with his professional friends his conduct was a model. His code of ethics was of the purest and loftiest character. He was not only courteous and dignified, but highly considerate of the rights of others. His habits of punctuality were established early in life, and were never departed from. He made it a rule never to make a professional brother wait for him at a consultation. The examination of his cases was conducted with great care and attention; indeed, he seemed occasionally to be over-minute and even tedious, spending a longer time over his patients than the exigencies appeared to require. His early habits of caution never forsook him at the bedside of the sick. In his intercourse with his patients his conduct was regulated by the nicest sense of honor. No one understood better how to deport himself in their presence, or how to preserve inviolate their secrets. Hippocrates, who exacted an oath from his pupils never to reveal anything that was confided to them by their employers, never more scrupulously observed the sanctity of the sick-chamber. Kind and gentle in his manners, he was as much the friend as the physician of his patients, not a few of whom made him their confidant and counselor. The advice which he delivered under such circumstances was often of great service to the interested party, by whom it was never forgotten, owing to the earnest and solemn tone in which it was imparted. In the bestowment of his time and labor, he made no distinction between the rich and the poor; the latch-string of his heart was accessible to all. "The importance of the malady and not the patient's rank or purse, was the measure of the attention which he paid the case." His practice in acute inflammatory diseases was bold and vigorous. The lancet was his favorite remedy; and he drew blood freely, and without stint, in every case in which the symptoms were at all urgent or threatening, provided the system was in a condition to bear its loss. Having attended, in early life, the lectures of Dr. Rush, the most eloquent and captivating teacher of medicine in his day, in this country, and a strenuous advocate of sanguineous depletion, he imbibed a strong prejudice in favor of this practice, which he retained to the latest period of his career. But it would be unjust to say that he employed the remedy without judgment or discrimination. If he bled freely he also knew when to bleed. No man had a better knowledge of the pulse and the powers of the heart. Although Dr. Drake had many warm, staunch, and ad-

miring friends, it would be untrue to say that he had no enemies. He had too ardent and positive a temperament, too much ambition, too much intellect, to be altogether exempt from this misfortune, if such, indeed, it may be called. The world's record abundantly confirms the conclusion, that no great, useful, or truly good man was ever wholly without enemies. Such an occurrence would be an anomaly in the history of human nature. It has been well observed, by one who was himself great, and who occupied, for many years, no small space of the public eye, that "slander is the tax which a great man pays for his greatness." The more conspicuous his position, the more likely will he be to have enemies to assail and misrepresent his character. It is only the passive, the weak, the idle, and the irresolute, who are permitted to pursue, unobserved and unmolested, "the even tenor of their way." To this class Drake did not belong. The life of Dr. Drake was surprisingly eventful. No man that our profession has yet produced has led so diversified a career. He was probably connected with more medical schools than any individual that ever lived. It is rare that physicians interest themselves in so many public and professional enterprises as he did. His mind was of unlimited application. His own profession, which he served so well and so faithfully, was incapable of restraining it; every now and then it overleaped its boundaries and wandered off into other spheres. His career was thus in striking contrast to that of medical men generally, whose pursuits furnish few incidents of public interest or importance. His mission to his profession and to his age was a bright and happy one. But his life was not only eventful; it was also eminently laborious. No medical man ever worked harder, or more diligently and faithfully. His industry was untiring, his perseverance unceasing. He had genius it is true, and genius of a high order; but without industry and perseverance it would have availed him little in the accomplishment of the great aims and objects of his life. His habits of industry, formed in early boyhood, before, perhaps, he ever dreamed of the destiny that was awaiting him, forsook him only with his existence. His life, in this respect, affords an example which addresses itself to the student of every profession and pursuit in life, which the young man should imitate and the old man not forget. The great defect in his character was restlessness, growing, apparently, out of his ardent and impulsive temperament, which never permitted him to pursue any subject very long without becoming tired of it, or panting for a change. His mind required diversity of occupation, just as the stomach, to be healthful, requires diversity of food. Hence, while engaged in the composition of his great work, he could not resist the temptations that presented themselves to divert him from his labors. His delight was to appear before the public to deliver a temperance address, to preside at a public meeting, or to make a speech on the subject of internal improvement, or the Bible or missionary cause. For a similar reason he stepped out of his way to write letters on slavery, and discourses before the Cincinnati Medical Library Association. No man in our land could have done these things better, few, indeed, so well; but useful as they are, it is to be regretted that he undertook them, be-

cause they occupied much of his time that might, and in the opinion of his friends, ought to have been devoted to the composition and completion of his great work, the ultimate aim and object of his ambition. It was the same restless feeling that caused his frequent resignations in medical institutions. Had his disposition been more calm and patient, he would have been satisfied to identify himself with one school, and to labor zealously for its permanency and renown. In moving about so frequently, he induced people to believe that he was a quarrelsome man, who could not agree with his colleagues, and whose ruling passion was to be a kind of autocrat in every medical faculty with which he was connected. But while his own conduct gave coloring to such an idea, nothing could have been more untrue. Dr. Drake always cherished a profound respect for Christianity, but it was not until 1840 that he made a public profession of his religious views. He then united himself with the Episcopal Church, of which he remained ever afterwards a devout member. The personal appearance of Dr. Drake was striking and commanding. No one could approach him, or be in his presence, without feeling that he was in contact with a man of superior intellect and acquirement. His features, remarkably regular, were indicative of manly beauty, and were lighted up and improved by blue eyes of wonderful power and penetration. When excited by anger or emotion of any kind, they literally twinkled in their sockets, and he looked as if he could pierce the very soul of his opponent. His countenance was sometimes staid and solemn, but generally, especially when he was in the presence of his friends, radiant and beaming. His forehead, though not expansive, was high, well-fashioned, and strongly denotive of intellect. The mouth was of moderate size, the lips of medium thickness, and the chin rounded off and well proportioned. The nose was prominent but not too large. The frosts of sixty-seven winters had slightly silvered his temples, but had made no other inroad upon his hair. He was nearly six feet high, rather slender and well formed. His power of endurance, both mental and physical, was extraordinary. He seemed literally incapable of fatigue. His step was rapid and elastic and he often took long walks, sufficient to tire men much younger, and apparently much stronger, than himself. He was an early riser, and was not unfrequently seen walking before breakfast with his hat under his arm, as if inviting the morning breeze to fan his temple and cool his burning brain. His manners were simple and dignified. He was easy of access, and remarkably social in his habits and feelings. His dress and style of living were plain and unostentatious. His house was the abode of a warm, but simple hospitality. For many years no citizen of Cincinnati entertained so many strangers and persons of distinction. He was a man of extraordinary refinement. This feeling was deeply engrafted in his constitution, and always displayed itself in a marked degree in the presence of the female sex. Although his parents were uncultivated persons and hardly ever mingled in the more refined society, they cherished a high and pure idea of the duty of good breeding. The principle of politeness was deeply rooted in both, and they never failed to practice it in their family and

in their intercourse with the world. To those who are engaged in scientific, literary, and educational pursuits, or in the practice of medicine, it will not be uninteresting to know that Dr. Drake was poor, and until the last eight years of his life, pecuniarily embarrassed. Referring to this subject the late Dr. Gross, his friend and colleague, has said, that it was not until after his connection with the University of Louisville that he began to lay up anything from his earnings. His medical journal only brought him into debt. The first volume of his great work sold slowly, and had not yielded him one dollar at the time of his death. Since that period, his son-in-law received, as his literary executor, two hundred and fifty dollars as the balance to the author's credit up to that time. This sum is not more than one-tenth of what he paid for the maps alone contained in the work, and engraved at his own expense. Nothing, in fact, that Dr. Drake ever undertook was pecuniarily profitable. Money-making was not his ambition. His aims were always so lofty, and so far removed from self, that he never thought of money except so far as it was necessary to their accomplishment.

DRAPER, John William, of New York City, was born at St. Helen's, near Liverpool, May 5, 1811, and died January 4, 1882. He received his education for the most part from private instructors. At eleven years of age he was sent to one of the public schools of the Wesleyan Methodists, of which denomination his father was a minister. He remained there, however, only two years, and was then returned to private instruction. When the University of London was opened, he was sent there to study chemistry under Dr. Turner, at that time the most celebrated of English chemists. At the instance of several of his American relatives, he came to America and completed his medical education at the University of Pennsylvania, graduating in 1836 with so much distinction that his inaugural thesis received the unusual compliment of being published by the faculty of that university. Shortly afterwards he was appointed Professor of Chemistry in Hampden Sydney College, Virginia, and in 1839 received an appointment to the same professorship in the University of New York, with which institution he was connected until 1881. His earliest scientific publications were on the chemical action of light, a subject at that time almost completely neglected. Eventually he published in American and foreign journals, or read before scientific societies, nearly forty memoirs in relation to it. Some of the more important facts stated in these papers must be mentioned: Of all the chemical actions of light, by far the most important is that of the decomposition of carbonic acid by the leaves of plants, under the influence of sunshine. On this the whole vegetable world depends for its growth, and the whole animal world directly, or indirectly, for its food. The decomposition in question is essentially a deoxidation, and up to about 1840 it was generally supposed to be due to the violet rays of the spectrum, which in accordance with the views held at that time, were regarded as producing deoxidizing actions, and were consequently known as deoxidizing rays. But this was altogether an assumption unsupported by experimental proof. Prof. Draper saw that there was but one method for the absolute so-

lution of the problem, and that was by causing the decomposition to take place in the spectrum itself. In this delicate and beautiful experiment he succeeded, and found that the decomposition was brought about by the yellow rays, at a maximum by those in the vicinity of the Fraunhofer fixed line D, and that the violet rays might be considered as altogether inoperative. The memoir containing this result was first read before the American Philosophical Society, Philadelphia, and immediately republished in London, Paris, and Berlin. It excited general interest among chemists. Even up to the present time it has furnished to the German experimenters the basis of a very interesting discussion in photochemistry. In 1842 Dr. Draper discovered that not only might the Fraunhofer fixed lines in the spectrum be photographed, but that there exists a vast number of others beyond the violet, which up to that time had been unknown. He also found three great lines less refrangible than the red, in a region altogether invisible to the eye. Of these new lines, which more than doubled in number those of Fraunhofer, he published engravings. He also invented an instrument for measuring the chemical force of light—the chlor-hydrogen photometer. This was subsequently extensively used by Bunsen and Roscoe in their photochemical researches. In their paper, read before the Royal Society in 1856, they say: "With this instrument Draper succeeded in establishing experimentally some of the most important relations of the chemical action of light." Most of the papers he had written up to 1844 were in that year collected and published together, in a book bearing the title of a treatise on "The Forces Producing the Organization of Plants." In this there are a great many experiments on capillary attraction, the flow of sap, endosmosis, the influence of yellow light on plants, etc. His memoir "On the Production of Light by Heat," published in 1847, was an important contribution to spectrum analysis; among other things it gave the means for determining the solid or gaseous condition of the sun, the stars, and the nebulae. In this paper he established experimentally that all solid substances, and probably liquids, become incandescent at the same temperature; that the thermometric point at which such substances are red-hot is about 977° Fahr.; that the spectrum of an incandescent solid is continuous, it contains neither bright nor dark fixed lines; that from common temperatures up to 977° Fahr. the rays emitted by a solid are invisible, but at that temperature they impress the eye with the sensation of red; that the heat of the incandescing body being made continuously to rise, other rays are added, increasing in refrangibility as the temperature ascends; and that, while the addition of rays so much more refrangible as the temperature is higher is taking place, there is an augmentation in the intensity of those already existing. This memoir was published in both American and European journals. An analysis of it was read in Italian before the Royal Academy at Naples, July, 1847, by Melloni, which was also translated into French and English. But thirteen years subsequently, M. Kirchhoff published, in a very celebrated memoir, considered by many as the origin of spectrum analysis, and of which an English translation may be found in the *Lon-*

don and Edinburgh Philosophical Magazine, July, 1860, the same facts under the guise of mathematical deductions, with so meager a reference to what Draper had done that he secured the entire credit of these discoveries. In an historical sketch of spectrum analysis subsequently published, Kirchhoff avoided all mention of his American predecessor. Dr. Draper was the first person who succeeded in taking portraits of the human face by photography. This was in 1839. He published a minute account of the process at a time when in Europe it was regarded as altogether impracticable. He also was the first to take photographs of the moon, and presented specimens of them to the New York Lyceum of Natural History, in 1840. In 1841 the University of New York established its medical college, Dr. Draper being appointed professor of chemistry in it. A very great change in medical studies and teaching was at that time impending. The application of chemistry to physiology was about to be made by Liebig and his school. In these new views Dr. Draper completely coincided, and therefore soon afterward physiology was added to his chair. He now resumed his early chemico-physiological researches, and eventually, in 1856, he published the result of them in "A Treatise on Human Physiology, Statical and Dynamical." This work at once became a standard textbook in American colleges. It has passed through a great many editions, and was translated into several foreign languages. The Russian edition is used in the higher schools of that country. In this work appeared an explanation of the selecting action of membranes; electrical theory of capillary attraction; cause of the coagulation of the blood; theory of the circulation of the blood; explanation of the flow of sap in plants; endosmosis of gases through thin films; measure of the force of endosmosis; respiration of fishes; action of organic muscle-fiber of the lungs; allotropism of living systems; new facts respecting the action of the skin; functions of nerve-vesicles and their electrical analogues; function of the sympathetic nerve; explanation of the action of certain parts of the auditory apparatus, particularly the cochlea and semicircular canals; new facts respecting the theory of vision and theory of muscular contraction. The special object of the book was to apply physical theories in the explanation of physiological facts, to the exclusion of the so-called vital principle of the old physicians. His "Physiology" was soon followed by a work of which the intention was to show that societies of men advance under the government of law. This was entitled "A History of the Intellectual Development of Europe." Few philosophical works have attained so quickly to celebrity. Many editions of it have been published in this country, and it has been translated into almost every European language. Dr. Draper has published a few mathematical papers, the most important being an investigation of the electrical conducting power of wires. This was undertaken at the request of Professor Morse, at the time he was inventing his telegraph. The use made by Morse of this investigation is related by him in *Silliman's American Journal of Science and Arts*, December, 1843. The paper shows that an electrical current may be transmitted through a wire, no matter what the length may be, and that, generally, the

conducting effect of wires may be represented by a logarithmic curve. Among electrical memoirs there is one on the tidal motions exhibited by liquid conductors, and one on the electro-motive power of heat, explaining the construction of some new and improved forms of thermo-electric batteries. An abstract of this improvement is given in the *Encyclopedia Britannica* (Art. Voltaic Electricity). He was the first person to obtain photographs of the diffraction spectrum given by a grating, and to show the singular advantages which that spectrum possesses over the prismatic investigations on radiations. In a memoir on the production of light by chemical action (1848), he gave the spectrum analysis of many different flames, and devised the arrangement of charts of their fixed lines in the manner now universally adopted. A memoir on phosphorescence contains the experimental determination of many important facts in relation to that property. Among purely chemical topics he has furnished a method for the qualitative determination of urea by nitrous acid. In 1864, at the request of the New York Historical Society, Dr. Draper gave four lectures before that body, which were subsequently published under the title of "Thoughts on the Civil Policy of America." They were respectively on the influence of climate upon man; on the effects of emigration; on the political force of ideas, and on the natural course of national development. They contain discussions of several interesting points, which since that time have largely occupied public attention, such as the internal emigration from the Atlantic States to the west, the Asiatic emigration to the Pacific States, the political effects of polygamy in Utah, the tendency of democratic institutions to centralization, a comparison of the European with the American method of government. From 1860 to 1870 Dr. Draper did but little in scientific research, devoting himself mostly to historical works. During this time he published his "History of the American Civil War," in three volumes. His opportunities for giving accuracy to the work were very great. It has been largely republished in Europe. Of some of his works translations have been made in French, Spanish, German, Russian, Italian, Polish and Servian, while portions of them have been reproduced in Arabic; of some of these translations there have been several editions. In the summer of 1870 Dr. Draper suffered a severe bereavement in the loss of his wife. Of Brazilian birth, she was connected with an ancient and noble Portuguese family. After the death of his wife, Dr. Draper spent the following winter in Europe, chiefly in Rome. Since his return he has published two short memoirs; one on the "Distribution of Heat in the Spectrum," showing that the predominance of heat in the less refrangible regions is due to the action of the prism and would not be observed in a normal spectrum, such as is formed by a grating, and that all the rays of light have intrinsically equal heating power. The second is an investigator of the distribution of chemical force in the spectrum. Also, a book entitled "History of the Conflict of Religion and Science," which is now circulating all over Europe. It has been placed in the *Index Expurgatorius* by the Papal government.

DRYSDALE, Thomas Murray, of Philadel-

phia, Pa., sixth son of William Drysdale, was born in Philadelphia, August 31, 1831. "His ancestors were Scotch Covenanters, his uncle, Rev. Alexander Duff, being the distinguished missionary of the Scotch Presbyterian Church. He received his preliminary education at the schools of the Rev. Joseph P. Engles and the Rev. Samuel Crawford, under whose tuition he was prepared for the University of Pennsylvania. Failing health, however, prevented the completion of his studies, and he was sent by his physician, Dr. James Rush, to the country, where he remained until his health was re-established. Early in life he had determined to devote himself to the study of medicine, and, encouraged by an improved state of health, he accepted a position in a drug store in order to become familiar with the science of pharmacy. Soon after he entered upon a course of medical instruction in the office of Dr. Washinton L. Atlee, who, at that time, occupied the chair of chemistry in the Pennsylvania Medical College. In connection with the office instruction under this distinguished surgeon, he attended lectures at the college, and became the assistant of his preceptor in his laboratory, of which he had full charge during the last two years of his college life. He graduated in 1852, making the subject of his thesis, 'Liebig's Theory of Animal Heat,' which he supported and proved by a carefully-conducted series of experiments made upon himself with nitrogenous and non-nitrogenous articles of food. After graduating, his health again failing, he made a pedestrian tour of his native State in company with a professional friend. This proved of great service, and he returned invigorated. In 1853, Dr. Drysdale became associated with Dr. A. Owen Stille and Dr. W. Kent Gilbert in the examination of students; subsequently he united with Dr. Wm. Gobrecht, formerly Professor of Anatomy in the Medical College of Ohio, and Dr. J. Aitken Meigs, afterward Professor of Physiology in the Jefferson Medical College, and engaged in the examination of students connected not only with the Pennsylvania Medical College, but with other similar institutions. In 1885, he was elected to fill the Chair of Chemistry in the Wagner Institute of Science, made vacant by the resignation of Professor Rand. Here he attracted large audiences, but was compelled to resign the position and devote himself exclusively to the duties of a rapidly-increasing practice, in which he made surgery and gynecology his specialties. In 1861, he performed successfully his first operation of ovariectomy, an operation which, at that time, was regarded with disfavor by the medical profession. In 1862, he delivered a course of lectures on the microscope, at the Franklin Institute, which reflected much credit on his abilities as a lecturer and microscopist. The study of the microscope had early claimed his careful attention, and notwithstanding the variety of professional duties which crowded upon him, he continued to pursue microscopical investigations, especially of the fluids of dropsies, adding important facts to the knowledge of the profession upon subtle points in discussion among physicians." He was one of the founders of the American Gynecological Society, June 3, 1876; was elected a member of the British Medical Association in 1877; has been a member of the American Medical Association since 1873; of the Pennsylvania State Medical Society since 1864;

of the Philadelphia County Medical Society since 1853; became a member of the Pathological Society in 1877; of the Obstetrical Society in 1877, and was a delegate to the International Medical Congress in 1876. He has been corresponding secretary of the Pennsylvania State Medical Society for several years; was vice-president of the Philadelphia County Medical Society in 1875, and president of the same in 1876. His contributions to medical literature comprise the following: "An Account of Three Surgical Cases," 1856; "Case of Rupture of the Common Duct of the Liver: Formation of a Cyst Containing Bile," 1861; "Drop-sical Fluids of the Abdomen: Their Physical Properties, Chemical Analysis, Microscopic Appearance, and Diagnostic Value, Based on the Examination of Several Hundred Specimens," forms Chapter XXIV. of Dr. W. L. Atlee's work on the "Diagnosis of Ovarian Tumors." A paper "On the Granular Cell found in Ovarian Fluid," read before the American Medical Association, and published in their proceedings for 1873; "The Address in Surgery (Tracheotomy in Diphtheria and Pseudo-Membranous Croup)" delivered before the Medical Society of the State of Pennsylvania, and published in their proceedings for 1874: "Address Delivered Before the Medical Society of the State of Pennsylvania," May, 1876, and published in their proceedings; "On the Use of Chlorate of Potassa in Diphtheria and Pseudo-Membranous Croup," 1877. Dr. Drysdale married Mary L. Atlee, second daughter of his preceptor, in October, 1857. His son, Dr. Wm. A. Drysdale, is associated with him in practice.

DU BOIS, Henry Augustus, of New Haven, Conn., died January 13, 1884. He was born August 9, 1808, in New York City, at what is now known as the corner of First avenue and First street, but which was then the country residence of his father, Cornelius Du Bois. "He was the sixth lineal descendant of Jacques Du Bois, a French Huguenot, who took refuge in Holland, and in 1675 came over with the Dutch settlers, to Kingston, Ulster county, N. Y., bringing with him his infant son, Pierre Du Bois, born in Leyden, and who afterwards became the founder of the first Reformed Dutch Church in Poughkeepsie, and, also of the one still existing in Fishkill, N. Y. On his mother's side he is the sixth in descent from John Ogden, who was born in North Hampton, England, in 1610, and represented South Hampton, Conn., in 1659, and during the Dutch rule was virtually the governor of the English portion of the province, and who afterwards settled in New Jersey, and built the first house in Elizabethtown. (See Hatfield's History of New Jersey.) In 1817, Henry Augustus Du Bois entered the French Military Academy of Louis Blancet, a royalist refugee of the first French Revolution. In 1822, he left the academy, and in 1823 entered Columbia College of New York. August 7, 1827, he was graduated A. B. of Columbia College; October 23, 1830, he was graduated M. D. of the College of Physicians and Surgeons, of New York, and the same year was appointed house physician to the New York Hospital; October, 1831, he went to Europe to complete his medical studies. In Paris, he entered the clinical courses of Louis, Andral, Chomel, and Broussais, in medicine; and of Dupuytren, Lisfranc, Roux, Velpeau, and of Amussat, in surgery. He was an intimate friend of Louis, and his

private pupil in auscultation. He was the private pupil of Amussat in practical surgery, and of Mde. La Chapelle in obstetrics. He was also the private pupil of the celebrated Elie de Beaumont, with whom he made many geological excursions. In 1831, shortly after his arrival in Paris, he was made a member of the Polish committee, which met weekly at the house of its president, General Lafayette, or at the house of J. Fennimore Cooper, the object of the committee being to send money and men to aid Poland in her last brief but ineffectual struggle for liberty. Dr. Du Bois had formed the design of joining the Polish army, but was dissuaded therefrom by the committee, who judged the attempt futile." April 9, 1834, he was elected, at Paris, a member of the Geological Society of France, and in the same year attended the funeral of General Lafayette. He was one of the few who availed themselves of the special honor accorded to Americans of following immediately next to the body, this being the post of danger as well as of honor, for it was well known that an attempt would be made by the "Red Republicans" to obtain possession of the body, in order to make it their rallying standard. The first attack was made in the Place Vendome, and the double line of cuirassiers were forced back upon the cortege, nearly crushing Dr. Du Bois and others who were nearest to the bier. While in Europe he made the acquaintance, and received tokens of regard and friendship, from Sir Astley Cooper, Mr. Liston, of Edinburgh, and from Rasori and Tomassini, the celebrated authors of the "contra-stimulant" theory of bygone days. November, 1834, Dr. Du Bois returned to New York, and in 1835 was appointed first on the list of physicians to the New York Dispensary. December 17, 1835, he was married to Catherine Helene Jay, third daughter of Peter A. Jay, Esq., of the New York bar, by whom he has had seven sons and one daughter. February 6, 1837, he was elected a member of the New York Lyceum of Natural History. In the fall of 1840, Dr. Du Bois, acting in obedience to medical advice, gave up the practice of medicine on account of his health, and removed to Ohio, where he had inherited a large tract of unimproved land, situated between the two branches of the Mahoning river. Upon this tract he laid out, and in a great measure built, the village of Newton Falls, which, in 1852, became a pleasant and flourishing town, well supplied with churches, schools, mills, and stores. While residing in Ohio he constantly refused to receive patients, his time being fully engrossed by more healthful and lucrative pursuits; but, from motives of humanity and love for his profession, he consented to act as consulting physician for some dozen "doctors" in the neighborhood, who frequently called upon him in urgent or obscure cases, and whose opinions and practice he took especial pains to modify and improve. One of the most skillful of them, a regular M. D., often declared publicly that all his most valuable medical knowledge he had obtained from Dr. Du Bois. In 1852 he returned to New York, in improved health, but he did not resume the practice of medicine. He accepted the position of president of the Virginia Cannel Coal Company, whose business he continued to manage for several years, as well as that of its successor, the Peytona Cannel Coal Company, of Kanawha, W. Va. October 14,

1854, he removed to New Haven, Conn., for the purpose of educating his numerous family of sons, one of whom is now professor of dynamical engineering in the Scientific Department of Yale College. July 28, 1864, he received from Yale College the degree of LL. D., signaling him as one "*qui de fide Christiana defendenda bene meritus sit*," for his reply to the seven English "essayists," which was republished in London, with high eulogy, by the Dean of Carlisle; and for his "critical examination" of the scientific infidelity of Darwin and Huxley. September 19, 1864, he was elected a member of the Academy of Arts and Sciences of Connecticut. October 20, 1869, he went to France, Italy and Malta, for the recovery of his health, seriously impaired by incessant labor and hardship in Kanawha, W. Va., during the previous four years, while managing the affairs of the Peytona Cannel Coal Company. He returned July 5, 1870, but was obliged to leave again, in 1872, with a portion of his family, and remained in Europe till September, 1874, when he returned to his residence in New Haven. Although Dr. Du Bois was prevented at first by ill health, and afterwards by other causes, from the continuous practice of medicine, he always maintained an intimate acquaintance with the profession. Immediately on his removal to New Haven, he was elected an honorary member of the medical association of that city, and regularly attended their weekly meetings for the purpose of conference and debate. Though he has published no contributions to the science of medicine, he may be said to have materially modified the opinions and practice of many of his professional brethren with whom he came in contact during his long and eventful career. When the scarlet fever, some fifty years ago, prevailed in New York as an epidemic, he took a stand directly opposite to the theory of the "books" and the current practice of the day. He considered the epidemic asthenic in its character, and unsuited to the severe antiphlogistic treatment which then prevailed. He maintained that the disease was a determinate one, and must run its regular course, and scouted the idea that it could be "jugulated" by active treatment. He treated his patients successfully, with topical applications—quinine and a supporting regimen—while the best physicians, in the best quarters of the city, lost three out of five of bad cases, by antiphlogistic treatment. His French medical experience had prepared him to look with disfavor on what was then called the antiphlogistic practice, which consisted chiefly in bleeding, purging, calomel, and tartar emetic. There was another point in which Dr. Du Bois differed from the majority of his medical brethren. It was, and perhaps still is, a latent belief among practitioners, that there is something life-giving and disease-killing in the action of potent remedies, and that, after the force of the disease has been broken, they should still be exhibited to sustain life and confirm convalescence. In opposition to this opinion, he maintained that all our most potent and valuable remedies were, *per se*, life-destroying, and that their only useful application consisted in working changes in the system incompatible with the more deleterious changes which disease was working, and therefore should be withdrawn at the very earliest opportunity. His rule was that, in all acute febrile diseases,

active treatment by potent remedies must be confined to the first seven to ten days from the attack. Dr. Du Bois contributed two sons to the defense of his country during the War of the Rebellion, the only two who were then of age.

DUDLEY, Benjamin Winslow, of Lexington, Ky., was born in Spottsylvania county, Va., April 12, 1785, and died January 20, 1870. He was the son of Ambrose Dudley, a distinguished Baptist minister and one of the early pioneers of Kentucky. "When but a year old he was brought by his father to Lexington, in which beautiful city the child became a man and lived, and wrought, and died at the advanced age of eighty-five years." In his address as president of the American Surgical Association, delivered at Washington City in 1890, Dr. D. W. Yandell, referring to the subject of this sketch, describes in the following brief but eloquent terms the surroundings which set their impress upon the character of the noted pioneer surgeons of his State. The picture is full of meaning, dignity, and simplicity. In this time "Canetuckee" was still a part of Virginia. The grounds on which as boys they played were held by their fathers under what is known as a "tomahawk claim." Beyond lay endless leagues of shadowy forest. "The Illinois" had not been admitted into the sisterhood of States. The vast domain west of the Mississippi river was unexplored. The city of St. Louis was but an out-post for traders. The name "Chicago" had not been coined. Fort Dearborn, occupied by two companies of United States troops, marked a roll in the prairie among the sloughs, where stands to-day the queen and mistress of the lakes. Cincinnati had no place on the map, but was known as Fort Washington. General Pakenham had not attempted the rape of New Orleans, and General Jackson, who was to drive him with his myrmidons fleeing to his ships, were unknown to fame. Wars with Indians were frequent, massacres by Indians were common. The prow of a steamboat had never cut the waters of a western river; railroads were unknown in the world. There were but two avenues by which Kentucky could be reached from the East. One was the waterway furnished by the Ohio river, the other was the "Wilderness Road," blazed by Daniel Boone. The former was covered in keel-boats, flat-boats and canoes, the latter was traveled on horseback or on foot. No wheel had broken it, or been broken by it. The first settlers followed the road after crossing the Alleghanies. They were a clear-eyed, a bold, an adventurous people. They wrested the land from the savage, made it secure by their arms, and by the toil of their hands fitted it for its present civilization. Among these, and of such as these, were our heroes in the bloody exploits of surgery reared. From such ancestors they drew that dauntless courage which was so often tried in their achievements—achievements the fame of which will not lapse with the lapse of time. Boone had opened the way to the wilderness around them. He "blazed" a path through its unbroken depths, along which the stream of civilization quickly flowed. They blazed a path through the unexplored regions of their art along which surgeons continue to tread. His name is written in the history of his adopted State and embalmed in the traditions of its people. Their names are written in the chronicles of their

beloved calling and upon the hearts of myriads of sufferers whom their beneficent labors have relieved. They may or may not have felt that their work was durable. But durable it is, and it hands down to posterity a *monumentum ere perennius*, the absolute worth of which passes computation. No present or future modification of this work can rob its authors of that glory which crowns the head of the original workman. Like their kinsmen in genius, these toilers devised measures and dealt with issues in advance of their time. Like them they enjoyed but scant recompense for labors the far-reaching significance of which they did not comprehend. Let us who are reaping in the harvest which they sowed forget not how much we are beholden to these immortal husbandmen. And as we contemplate the shining record of their deeds, let it counsel us to "bend ourselves to a better future." Not that we may hope to rival their sublime achievements, but that each in his walk, however humble it may be, may strive to enlarge the sphere of his usefulness by making surgery the better for his having practiced it. Dr. Dudley studied medicine in Lexington with Frederick Ridgley, a very cultivated physician and popular man, who had won distinction in the medical staff of the Continental Army. Young Dudley attended lectures at the University of Pennsylvania, from which institution he was granted his medical degree in 1806, just two weeks before he was twenty-one years old. The subject of his graduating thesis was the "Medical Typography of Lexington." He returned home, opened an office, and offered his services to the public. The public gave him little business. "He was," says Dr. Yandell, "deficient either in the knowledge or in the self-trust necessary to professional success. McDowell was located in a village hard by—was applying himself mainly to surgery and was already in full practice. Dudley resolved to still better qualify himself for the work he was ambitious to do. He longed to go into the hospitals and follow the great teachers of Europe, but lacked the means. To get these he made a venture in trade. He purchased a flat-boat, loaded it with produce, headed it for New Orleans, and floated down the Kentucky, the Ohio, and the Mississippi rivers to the desired port. He invested the proceeds of his cargo in flour. This he billed to Gibraltar, which he reached some time in 1810; there, and at Lisbon, he disposed of it at a large advance." The opportunities he had sought were now near at hand. He hastened through Spain to Paris. While there he studied under Paul A. Dubois, and heard Baron Larrey recite his wonderful military experience. He made the acquaintance of Caulaincourt, "the Emperor's trusted minister." Through him he was present with Talma and John Howard Payne, in the Chamber of Deputies, when Napoleon entered the building at the close of his disastrous Russian campaign. He saw the Emperor mount the tribune. He heard him begin his report with these portentous words: "The Grand Army of the Empire has been annihilated." Remaining in Paris nearly three years, he crossed the Channel to observe surgery as practiced in London. While there he listened to Abernethy, as he dwelt with all his wonted enthusiasm on his peculiar doctrine. He heard him reason it; he saw him act it, dramatize it, and came away

believing him to be "the highest authority on all points relating to surgery, as at once the observant student of nature, the profound thinker, and the sound medical philosopher." He always referred to him as the greatest of surgeons. He saw Sir Astley Cooper operate, and habitually designated him as the most skilled and graceful man in his work he had ever known. He returned again to Lexington in the summer of 1814, "in manners a Frenchman, but in medical doctrine and practice thoroughly English." The public was quick to detect that he had improved his time while away. "His profession had become the engrossing object of his thought, and he applied himself to it with undeviating fidelity. He made himself its slave." One who knew him well, wrote of him: "He had no holidays. He sought no recreation; no sports interested him. His thoughts, he had been heard to say, were always on his cases, and not on the objects and amusements around him." He found Lexington in the midst of an epidemic of typhoid pneumonia, the same that had prevailed in the older States. This singularly fatal disease was followed by a bilious fever, characterized, like the plague, by a tendency to local affections. Abscesses, formed among the muscles of the body, legs and arms, and were so intractable that limbs were sometimes amputated to get rid of the evil. Recalling the use he had made of the bandage in the treatment of ulcers of the leg, Dudley applied this device to the burrowing abscesses he saw so frequently in the subjects of the fever. The true position and exceeding value of the roller bandage were not so generally recognized then as now. Dr. Dudley was no doubt himself surprised at the success which followed the practice. This success probably led him to urge that wide application of the bandage with which his name came in time to be so generally associated. The tide of practice now set fully toward him. He had come home a thorough anatomist. With opportunity he exhibited surpassing skill in the use of the knife. His reputation soon became national. No medical school had at that time been founded west of the Alleghanies. The need of such an institution was felt on every hand. Transylvania University, already of established reputation, was in operation. It only required a school of medicine to make it complete in its several departments. The trustees met in 1817, and added this to its organization. Dr. Dudley was made its head, and appointed to fill the chairs of anatomy and surgery. A small class of students assembled in the autumn. At the commencement exercises held the following spring, W. L. Sutton was admitted to the doctorate—the first physician given that distinction by an institution in the West. Troubles arose in the Faculty. Resignations were sent in and accepted. Dr. Richardson, one of the corps, challenged Dr. Dudley. A meeting followed. Richardson left the field with a pistol wound in his thigh, which made him halt in his gait the rest of his life. The year following a second organization was effected, which included the two belligerent teachers. "The history of the Medical Department of Transylvania University, its rise, its success, its decline, its disappearance from the list of medical colleges—would practically cover Dr. Dudley's career and would form a most interesting chapter in the development of medical teaching in the southwest. But it

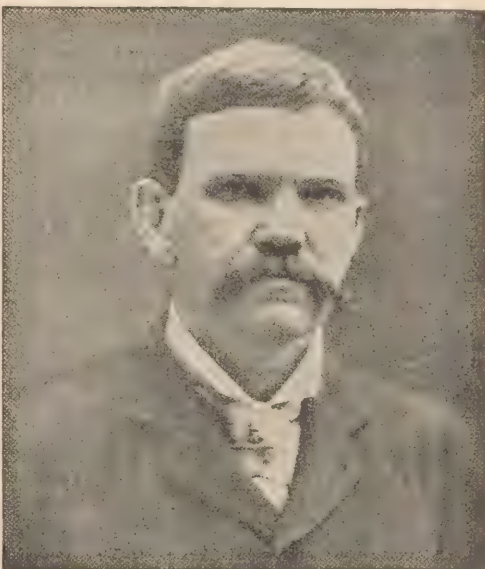

must suffice to say that Dr. Dudley created the medical department of the institution and directed its policy. Its students regarded him from the beginning as the foremost man in the faculty. That he had colleagues whose mental endowments were superior to his he himself at all times freely admitted. He is said to have laid no claim to either oratorical power or professional erudition. He was not a logician, he was not brilliant, and his deliverances were spiced with neither humor nor wit." A yet, says one of his biographers, in ability to enchain the student's attention, to impress them with the value of his instructions and his questions as a teacher, he bore off the palm from all the gifted men who, at various periods, taught by his side. A friend and once a colleague described his manner while lecturing as singularly imposing and impressive. "He was magisterial, oracular, conveying the idea always that the mind of the speaker was troubled with no doubt. His deportment before his classes was such as further to enhance his standing. He was always, in the presence of his students, not the model teacher only, but the dignified, urbane gentleman; conciliating regard by his gentleness, but repelling any approach to familiarity; and never for the sake of raising a laugh or eliciting a little momentary applause descending to coarseness in expression or thought. So that to his pupils he was always and everywhere great. As an operator they thought he had distanced competition. As a teacher they thought he gave them not what was in the books, but what the writers of the books had never understood. They were persuaded that there was much they must learn from his lips or learn not at all." His hold upon the public was as great as that upon his classes. "Patients came to him from afar because it was believed that he did better what others could do than any one else, and that he did much which no one else in reach could do." During the larger part of Dr. Dudley's life few physicians in any part of America devoted themselves exclusively to surgery. The most eminent surgeons were general practitioners—all-round men. In this class Dr. Dudley was equal to the best. In one respect, at least, he took advance ground—he condemned blood-letting. He was often heard to declare that every bleeding shortened the subject's life by a year. Admiring Abernethy more than any one of his teachers, his opinions were naturally colored by the views of this eccentric Englishman. Like him he believed in the constitutional origin of local diseases, but his practice varied somewhat from that of his master. Like him he gave his patients "blue pill" at night, but omitted the "black draught" in the morning. He thought an emetic better, and secured it by "tartarized antimony." Between the puke and the purge his patients were fed on stale bread, skim milk and water gruel. And this heroic practice he pursued day after day for weeks and months together in spinal curves, hip curves, tuberculosis, urethral stricture and other diseases. But referring to this method of treatment, Dr. Yandell, in his address, has said that as a physician Dudley was equal to the best of his day. "Negatively, if not positively, he improved upon the barbaric treatment of diseases then in universal favor. He wholly discarded one of the most effective means by which the doc-

tors succeeded in shortening the life of man. This was just before those biological dawnings which were soon to break into the full light of physiological medicine and the rational system of therapeutics based thereupon. And it is not improbable that as a watcher in that night of therapeutical darkness, where the doings of the best strike us with horror, his prophetic eye caught some glimpses of the coming day which in old age it was given him to see. Though engaged chiefly with the great things of surgery, he deserves a place in the list of therapeutic reformers. Much of the renown acquired for Kentucky by her surgeons was in the treatment of calculous diseases. This State is believed to have furnished almost as many cases of stone as all the rest of the Union. Dr. Dudley stands the confessed leader of American lithotomists, heading the list with two hundred and twenty-five cases, losing only six patients, and had occasion to repeat the operation in but one instance. His success was so great that in England he was declared to be "the lithotomist of the nineteenth century. Of his cases of vesical calculi he presents an unbroken series of one hundred consecutive successful operations. In one case, when his patient was on the table, he discovered that his accustomed operation was impracticable from deformity of the pelvis, and while his assistants were taking their positions resolved to make the external incision transverse, which was executed before any one else present had remarked the difficulty." Through this incision he removed a stone three and a half inches in the long diameter, two and a half inches in the short, by eleven inches in circumference. The patient recovered. Dr. Dudley performed the lateral operation exclusively and almost always with the gorget, a surgical devise now becoming obsolete. He preferred the instrument invented by Mr. Cline of London. In an article contributed to the *Pennsylvania Journal of Medicine* by Dr. Dudley in 1828, he thus wrote of the trephine. "The experience which time and circumstances have afforded me in injuries of the head induced me to depart from the commonly received principles by which surgeons are governed in the use of the trephine. In skillful hands the operation, beyond the atmosphere of large cities, is neither dangerous in its consequences nor difficult in the execution." In this remark, says his biographer, Dr. Dudley bore early testimony to the efficacy of aseptic surgery. "He urged the trephine in the treatment of epilepsy and applied it in six cases—in four of which the disease was cured. The result in the two remaining cases is unknown, because the patients were lost sight of. Dr. Dudley believed himself to be the first surgeon who ever attempted to treat *fungus cerebri* by gentle and sustained pressure made with dry sponge aided by the roller. Of the first cases in which he used it he wrote. "By imbibing the secretions of the part the pressure on the protruded brain regularly and insensibly increased until the sponge became completely saturated. On removing it the decisive influence and efficacy of the agent remained no longer a matter of doubt." He noted the difficulty experienced in removing the sponge because of its being extensively penetrated by blood-vessels springing from the surface of the brain. This inconvenience he afterward obviated by putting a thin piece of muslin be-

tween the fungus and the sponge. He saw in this property of the sponge what no doubt others had seen before, the phenomenon of sponge-grafting, but like them he failed to utilize it in practice. (See Yandell's address, "Pioneer Surgery in Kentucky.") "Dr. Dudley was not a student of books. He had no taste for literature. He wrote but little, and that only for the *Transylvania Journal of Medicine*, edited by two of his colleagues, Professors Cooke and Short. His first article did not appear until 1828, fourteen years after he had begun practice. It was on injuries of the head. It abounded in original views, and did much to shape surgical thought at the time. To-day it may be consulted with profit. His second paper was on hydrocele; in this he advocated the operation by incision and removal of the sac. He read so little that he fell into the error of believing that he was the originator of the procedure. There are writers in our own day who would be able to hold their own against him in this particular. A paper on the bandage, another on fractures, and one on the nature and treatment of calculous diseases, embrace all his contributions to medical literature." He believed that Asiatic cholera was a "water borne" disease and during the first great epidemic in this country (1832), he and his family drank cistern instead of well water and were the only ones in Lexington to escape the malady. Dr. Dudley was a man of affairs. His practice was always large and paid him well. He amassed a handsome fortune. His opinions were often sought in courts of justice on professional points where his dignity, self-possession, and dry wit (which he seems to have suppressed at the lecturer's desk) commanded the respect of judge, juror, and advocate, while it made him the terror of the pettifogger. Dr. Dudley had also a proper sense of the value of his professional services. It is said that he was called on one occasion to a town near Lexington, to attend a patient in labor, who was the wife of a man made rich by marriage. The husband was too wise to engage a "night rider," and too purse proud to call the village doctor. At that time most of the one hundred dollar notes in circulation in Kentucky were issued by the Northern Bank, at Lexington. On the reverse side of the bill was the letter C in Roman capital. This letter was so round in figure that it looked like a "bull's-eye," and in local slang was so called. The visit being over, and the doctor ready to leave, the young father handed him one of these notes. Eyeing it for a moment, Dr. Dudley said: "Another 'bull's-eye,' Mr. X., if you please." In person Dr. Dudley was of medium size. "His features were refined, the forehead wide and high, the nose large and somewhat thick, the lips thin, the eyes bluish-gray. His hair was thin, light, and of a sandy tint. He was a graceful man. His voice was pleasing; his manners courtly; his bearing gracious." He married a daughter of Major Peyton Short in 1821. He delivered his last lecture in 1850, and the last entry on his ledger bears the date of April 28, 1853.

DUDLEY, Emelius Clark, of Chicago, Ill., was born in Westfield, Mass., May 29, 1850. His direct ancestor, a brother of Governor Thomas Dudley, landed in Boston, in 1638, and afterward settled in the famous old village of Guilford, Conn., the cradle of so many noted

New England families. His father's father and his mother's grandfather fought in the Revolutionary War, and at a later period of our history, his great uncle held the important position of postmaster-general. The following extracts, relating to the life history and professional achievements of the subject of this sketch are derived from a recent number of the *New York Journal of Gynecology and Obstetrics*: "Dr. Dudley's father was a farmer in the summer, and in the winter taught the district-school. Those who have some knowledge of New England life and character will appreciate what the union of school and farm meant. New England farms were not the most productive, and they required close attention to make their cultivation a success. The village life seventy-five years ago, resembled that in Merry England, without the interference of a superior and governing class,

E. C. Dudley

and the school-teacher in both countries was a man representing the culture of the people. On the "old sod" he dealt with an intelligence which had been repressed by its surroundings. In New England the people were infected with a bustling industry, which was forever endeavoring to find methods for accomplishing more work in a given time. Idleness was regarded as a crime. The district teacher had no easy task to keep his shoulders above the tide of knowledge coming from every source open to their eager search. Most of them became bent, from too studious a life, and dyspeptic, from a diet suited to the out-of-door life of their companions. But when the book-worm is joined to the tiller of the soil, strength and knowledge go hand in hand. Could we suggest a better parentage for one who had to carve his career to fame and fortune in the bustling Queen City? The subject of this sketch attended the public schools in Westfield until

thirteen, and from this age until eighteen he was in the service of an apothecary. This gave him a practical knowledge of pharmacy, which has always proved serviceable. In September, 1868, at the age of eighteen, he began the study of Latin, Greek, algebra, and geometry, with a tutor, and eight months later passed the entrance examinations for the Freshman class of the Academical Department of Dartmouth College. He graduated from this institution in 1873, with the degree of A. B. While a student at college he taught school four terms, and at the end of each term returned to Dartmouth, made up lost studies, and continued with his class. During his collegiate career he relied almost entirely on his own efforts for support." In the summer of 1872 he was attached to the United States Coast Survey with Professor Quimby, who was engaged in triangulations between the New Hampshire sea coast and Lake Champlain. He attended medical lectures at Yale in 1873-4, and coached the boys preparing for the Freshman class in Latin, Greek and mathematics. He took his medical degree at Long Island College Hospital in 1875, and was valedictorian of his class. After serving for a short period as interne at the West Pennsylvania Hospital, in Pittsburg, and at the Charity Hospital, Blackwell's Island, he entered on his service at the Woman's Hospital, in New York, and remained there eighteen months, completing the term in 1878. From this time he has been practicing in Chicago. In 1882 the Northwestern University Medical School (Chicago Medical College) invited Dr. Dudley to accept the position of Professor of Gynecology, and he stills holds this position. In 1885 he was elected, by Dartmouth students, a member of the Phi Beta Kappa Society. Among the various positions he has held or holds may be mentioned that of Gynecologist to St. Luke's Hospital, Chicago; Member of the New York County Medical Society; Chicago Gynecological Society; American Medical Association; American Academy of Medicine; American Gynecological Society; British Gynecological Society; Woman's Hospital Alumni Association, and was president of the organization in 1892, and has a membership in various State and other local societies. He founded and was editor of the *Chicago Medical Review*. The following is a list of his papers: "Puerperal Laceration of the Cervix Uteri and the Operation of Trachelorrhaphy as a Means of Cure," *Chicago Medical Journal and Examiner*, March, 1879; "Displacements of the Uterus," *Pepper's System of Medicine*; "Pressure Forceps Versus the Ligature and the Suture in Vaginal Hysterectomy," *Gynecological Transactions*, 1888; "A Plastic Operation Designed to Straighten the Anteverted Uterus," *American Journal of Obstetrics*, 1891, and numerous other contributions to medical literature, relating chiefly to diseases of women. The character of his work has arrested attention abroad as well as at home. His reputation, both in America and Europe, is that of a plastic surgeon and of a specialist in diseases of women. His practice is, we believe, among the largest of Chicago, and he has a very large consulting practice in the surrounding States. Dr. Dudley's marked characteristics are said to be his strength of purpose, untiring energy and decided originality.

DUFFIELD, Samuel Pearce, of Detroit,

Mich., was born at Carlisle, Pa., December 24, 1833. He is a son of the Rev. George Duffield, D. D., and a great, great grandson, of George Duffield, who emigrated from Ireland to the colony of Pennsylvania, settling first in Lancaster county about the year 1730. His great grandfather, George Duffield, born in Lancaster county in 1732, and ordained a minister of the gospel in 1761, served as a fighting chaplain in the American Army through the darkest hours of the Revolution, a reward for his head having been offered by the English. His paternal ancestry ascends to the Huguenot family, noticed in the books of heraldry under the name of Du Fielde, from the French *Du Ville*, and which accompanied William the Conqueror to England. His mother, Isabella Graham Bethune, of New York, was a sister of the distinguished Dr. Bethune, of that city, and granddaughter of Isabella Graham, the celebrated Christian philanthropist. He began his studies at the University of Michigan, and continued them at the University of Pennsylvania, when his eyes failing, he went abroad, and in 1856 and 1857 was under Von Graefe's treatment, and attended his clinics in Berlin, after which he went to Munich, where he studied under Liebig, and in accordance with Liebig's recommendation, graduated before the faculty of Giessen as doctor of philosophy and medicine. Returning to Detroit in 1858, he entered upon his practice as a physician there, still keeping up prominently, however, his chemical investigations. His specialty embraces chemistry, toxicology, and obstetrics. He has been called as an expert in several important trials, among them the celebrated Vanderpool case in Michigan, tried three times and in which he appeared as the chemist for the people. He is a member of the Detroit Academy of Medicine; of the State Medical Society; the American Pharmaceutical Society; the Northwestern Medical; the American Medical and the American Public Health Associations. His medical writings comprise papers on "Well Water as the Cause of Malarial Dysentery," "Ventilation of Sewers," "Contamination of Drinking Water," "Analysis of Alcoholic Liquors," "Pure Brandy," "Analysis of Malt by Polarization," "Aconite Poisoning," and "Small-Pox Epidemic in Dearborn Township." He delivered the opening address at the founding of the Detroit Medical College in 1868; read a paper at the Detroit meeting of the American Pharmaceutical Association on "The Relation of Hypodermic Injections to Toxicology," which was published in the Transactions of the association, and in 1876 delivered before the Young Men's Christian Association of Detroit a lecture entitled "The Religion of Christ vs. the Religion of the Scientists." He was employed at one time by the city controller to settle a discrepancy between the Detroit Gas Works and the city gas inspector, which he did to the satisfaction of both parties. He was also employed by some capitalists of Boston to examine into the truth of the tin pool on the North shore of Lake Superior, which he exposed as a fraud, exposing in like manner the Batchewanny iron mine. In 1877 he was called to be Professor of Chemistry and Chemical Director, vice Professor Douglass, at the University of Michigan, but owing to the fact that matters were not in a satisfactory condition in the University, and because the tender of the professorship was

made for only one year, refused to leave his active duties as a practitioner of medicine. Dr. Duffield is now health officer of the city of Detroit.

DUHRING, Louis A., of Philadelphia, was born in that city, December 23, 1845. His father, Henry Duhring, came to this country, in 1818, from Mecklenburg, Germany, and became one among the most successful merchants in Philadelphia. His mother was a native of St. Gall, Switzerland. He pursued his studies at the University of Pennsylvania, graduated from the medical department in 1867, and was shortly after elected one of the resident physicians to the Philadelphia Hospital. In this position he remained fifteen months, during which time he commenced the study of cutaneous diseases, a branch of medicine for which he already showed marked aptitude and taste. On the expiration of his term as resident physician, he sailed for Europe, and spent two years in acquiring a thorough knowledge of dermatology in the hospitals of Paris, London and Vienna, the greater part of his time being passed in the latter city, under the tuition of the celebrated Hebra. While abroad, he wrote several papers on affections of the skin for the medical journals, all of which gave evidence of careful study and practical ability. He returned home, and, in the latter part of 1870, founded and opened the Philadelphia dispensary for skin diseases, a branch of medicine heretofore sadly neglected in the United States. About this time he also became one of the editors of the *Photographic Review of Medicine and Surgery*. In the spring of 1871 he was elected clinical lecturer upon diseases of the skin in the University of Pennsylvania, and four years later he was elected professor of diseases of the skin in the hospital attached to that institution. He now holds the same position in the university. He is a permanent member of the American Medical Association; vice-president of the American Dermatological Association; a member of the Philadelphia College of Physicians; of the Pathological Society, and a corresponding member of the New York Dermatological Society; member of the Philadelphia County Medical Society, and was a delegate to the International Medical Congress in 1876. He is the author of "A Practical Treatise upon Skin Diseases," which has been translated into French, Italian and Russian; "Atlas of Skin Diseases;" also, "Epitome of Skin Diseases," and has contributed freely to the leading medical periodicals of America. His practice is confined entirely to diseases of the skin.

DUNCAN, Burwell A., of West Point, Miss., was born in Greenville, S. C., March 24, 1835. He is the son of the late Hon. Perry E. Duncan and Mary A. Duncan, who were among the most prominent citizens of that city and connected with the most prominent families of that State and Georgia. While Dr. Duncan was quite young his parents moved to their farm, near Greenville, and his education was begun in a common country school of that period. But he subsequently attended the academy in Greenville, and then entered Furman University, of that city, where he remained four years; then studied medicine with Drs. Turpin and Jones, and finally graduated from the Medical College of the State of South Carolina, at Charleston, in 1857. In

1858 he moved to Mississippi, and soon afterwards married Miss Celestia A. Strong, a most excellent and accomplished young lady, the daughter of Gen. Elisha Strong, of Aberdeen. Coming into possession, through this marriage, of large landed property in one of the most fertile regions of Mississippi, Dr. Duncan, prior to the Civil War, devoted himself chiefly to his extensive farming interests, and felt his full share of the ruin which fell upon the large property holders of the South. At the close of the Civil War, finding his farming operations of but little profit under the new system of labor, he resumed the practice of his profession, in which he has been eminently successful. In addition to an active general practice, Dr. Duncan is surgeon of the Georgia Pacific Railroad and Examiner of the Mutual Life Insurance Company of New York. He is also a member of the State and American Medical Associations and of the National As-

Burwell A. Duncan.

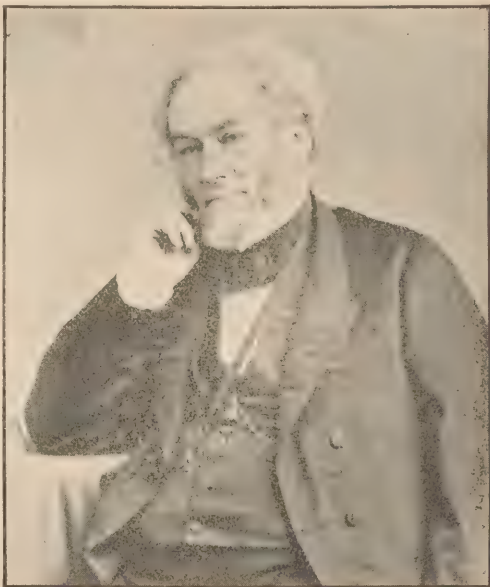

sociation of Railroad Surgeons, and Vice-President of the Pan-American Medical Congress from Mississippi. He has been for several years the chief health officer of his county. As a successful physician and surgeon, he has for several years contributed from time to time his experience in valuable articles to the *Journal of the American Medical Association*, *Transactions Mississippi Medical Association*, and recently also to the *Railway Age* and *Northwestern Railroad*. Among these contributions he has reported from his own experience, "Tumors of the Abdomen Successfully Removed;" "Fracture of Skull into Frontal Sinus;" "Severe Wound of the Abdomen, Involving Stomach and Liver;" "Pistol ball through Left Lung;" "Tetanus caused by Intestinal Irritation," and "Acute Rheumatism in Infancy." Dr. Duncan was the first surgeon in the United States to report rupture of the funis with mother in horizontal position, with normal length of cord (as in his case); has been reported in

only two cases—one by Spath (fetus macerated) and one by Dupuy. To these Budin (Paris) adds two cases. Dr. Duncan has twice represented Mississippi on the nominating committee in the American Medical Association, and also on the committee appointed by that association to draft suitable resolutions in defense of railway surgery, whose views were expressed in an article in the *Railway Age*, November 6, 1891. Dr. Duncan is a man of pleasing address and accomplished suavity of manners, and his kindness of heart and sympathetic nature have no doubt greatly aided his skill in the attainment of his professional success.

DUNGLISON, Richard James, of Philadelphia, was born November 13, 1834, in Baltimore, Maryland. He is the son of Dr. Robley Dunglison and Harriette Dunglison, natives of England. He pursued his academical course at the University of Pennsylvania, and his professional course at the Jefferson Medical College, taking in the former institution the degree of A. B. in 1852, and that of A. M. in 1855, and graduating from the latter in March, 1856. He settled in Philadelphia, where he has since resided. He is a member of the American Medical Association, of which he was assistant secretary, in 1876, and treasurer in 1877; of the Pennsylvania State Medical Society, of which he was corresponding secretary in 1875; of the Philadelphia County Medical Society, and of the College of Physicians, Philadelphia. He has contributed papers to the *North American Medico-Chirurgical Review*, among which may be mentioned, "Observations on the Deaf and Dumb," 1858, and "Statistics of Insanity in the United States," 1860, both of which appeared also in pamphlet form, and "Reflections on Exanthematic Typhus," 1861; to the *Medical and Surgical Reporter*, to the *Philadelphia Medical Times*, including a series of articles on "Public Medical Libraries of Philadelphia," 1872, published also as a pamphlet; and to the *New York Medical Record*, notably, "Letters on Medical Centennial Affairs," 1876, not to mention leading articles, letters, etc., to various medical journals. He edited Dunglison's "History of Medicine," 1872; Dunglison's "Medical Dictionary," 1874, and translated, from the French, Guersant's "Surgical Diseases of Children," 1873. In 1862, and the three following years, he was acting assistant surgeon in the United States army, on duty in various military hospitals at Philadelphia, and in 1864 and 1865 was executive officer of the Filbert street United States army hospital, Philadelphia. For kind and courteous treatment while serving in this capacity he is held in grateful remembrance by the editor of this work, who was associated with him for a short time as Medical Cadet United States Army. Dr. Dunglison was formerly physician to the Albion Society and Attendant Physician to the Pennsylvania Institution for the Instruction of the Blind, as also to the Burd Orphan Asylum. He was assistant secretary of the International Medical Congress, as well as corresponding secretary of the Centennial Medical Commission, and is honorary local secretary of the New Sydenham Society of London; president of the Musical Fund Society of Philadelphia; also, treasurer of the American Medical Association; treasurer of the Association of Acting Assistant Surgeons

United States Army, and editor of *College and Clinical Record*.

DUNGLISON, Robley, of Philadelphia, Pa., was born in Keswick, England, January 4, 1798, and died April 1, 1869. He received the degree of M. D. in London in 1819, and from the University of Erlangen in 1823. He settled at the British metropolis and began the practice of his profession, and also edited the *London Medical Repository* and the *Medical Intelligencer*, but in 1824, at the invitation of Thomas Jefferson, he came to the United States, and from that year till 1833 was Professor of Medicine in the University of Virginia. He then accepted the Chair of Materia Medica and Therapeutics in the University of Maryland, and in 1836 that of the Institutes of Medicine in Jefferson Medical College, Philadelphia, where he remained for more than thirty years, during a large portion of which

Robley Dunglison.

time he was dean of the faculty; and the extraordinary success of this institution was largely due to the attractive course of lectures and to the remarkable tact and practical sagacity with which he administered its affairs. He was a close student of philology and general literature, and enjoyed a high reputation for benevolence, which was especially exercised in giving time and services to the Philadelphia Institution for the Blind. Much of his attention was directed in later years to this cause and he was very successful in promoting the printing of books in raised letters for the use of the blind. Dr. Dunglison was president of the Musical Fund Society of Philadelphia; vice-president of the Pennsylvania Institution for the Blind and of the American Philosophical Society, and a member of many other literary and scientific organizations. In 1825 he received the degree of LL. D. from Yale. He translated and edited a large number of foreign works including Magendie's

"Formulary," the *Cyclopedia of Practical Medicine* of Dr. Forbes, Tweedie and Conelly, and also edited many originally published in the United States. His published works, which have sold very largely, comprise "Commentaries on Diseases of the Stomach and Bowels in Children," 1824; "Introduction to the Study of Grecian and Roman Geography," 1829; "Human Physiology," 1832; "Dictionary of Medical Science and Literature," 1833; of which fifteen editions were issued in the following twenty-five years. "Elements of Hygiene," 1835; "General Therapeutics," 1836; "The Medical Student, or Aids to the Study of Medicine," 1837; "New Remedies," 1839; "The Practice of Medicine," 1842; and "Human Health," 1844. The latter work being a second edition to his former work entitled "Elements of Hygiene."

DUNLAP, Alexander, of Springfield, Ohio, was born in Brown county, that State, January 12, 1815. His father, a farmer, was one of the pioneers of Ohio, having moved with his parents to Kentucky in 1782, or thereabout, and thence removed in 1796 to the former State, six years before its admission as a State into the Union. His mother's family came from Shepherds-town, of which place its members were probably the founders. He passed the Freshman and Sophomore years of his college life at the University of Ohio, in Athens, and his Junior and Senior years at the Miami University, graduating in 1836. He began to study medicine under his brother at Greenfield, Highland county, and attended lectures at the old Cincinnati Medical College, where he graduated in 1839. He associated himself in practice with his brother in Greenfield until 1846, when he removed to Ripley, Brown county, where he was engaged until 1856. Later he moved to Springfield. In 1843 he came into collision with the fraternity by venturing to remove an ovarian tumor. Although this operation had been performed, in a few cases, as early as 1809, with some success, by Ephraim McDowell, of Kentucky, it had been denounced by the profession and characterized as unjustifiable butchery, and for more than thirty years had been abandoned as an element of medical and surgical art. In the various publications there was nothing but a brief notice of its failure, and the condemnation of the faculty. Clay, of England, had performed the operation in 1842, and Atlee, of Philadelphia, in the summer of 1843. Two months after Atlee's operation, he, not then having heard of the cases of these two practitioners, and following only the traditional report of McDowell's case, ventured, at the earnest solicitation of the patient, who was apprised of the risk, to undertake the operation. Surrounded by a few country physicians, he finally undertook the case, and removed successfully a tumor weighing forty-five pounds. A few weeks later the patient died, and the operation was denounced as altogether unwarrantable on the part of a "country surgeon," while the medical journals refused to report the case. The woman's death had, however, not been the direct result of the operation, and though frowned upon in many quarters, he persevered in his studies and practice until a brilliant success dissipated entirely the clouds of prejudice. To-day his reputation as an ovariologist is co-extensive with the circulation of medical literature, while his practice extends throughout the cen-

tral and western portion of the United States. Down to the present time he has performed one hundred and twelve operations. In seventy-five per cent. of his cases he has met with complete success—a higher estimate than may be awarded to any other American or European ovariologist, with but a single exception. He has outlived denunciation, and in 1868 received from the faculty of the State of Ohio the compliment of an election to the presidency of the Ohio Medical Society. He was twice elected one of the judicial council of the American Medical Association, from which he resigned in 1877 to accept the vice-presidency. He was elected a fellow of the American Gynecological Society in 1877. He has lately been appointed to a professorship in the Starling Medical College, of Columbus, O. In "Gross's System of Surgery," Vol. II, he is reported, under the heading "Lithotomy," as "having successfully removed a stone weighing twenty ounces," the largest ever removed from a living person. In the volume of Transactions of International Medical Congress, 1876, he is quoted on the subject of "Fibroid Tumors of the Uterus." In volume of Transactions of American Medical Association, 1876, he is quoted on the subject of "Ovariectomy." He was a member of the International Medical Congress at Philadelphia, in 1876. Among exceptional cases he has three times removed the under jaw, once ligated the common carotid artery, and once removed the clavicle. His son, Dr. Charles W. Dunlap, is now associated with him.

DUNMIRE, George Benson, of Philadelphia, Pa., was born near McVeytown, Mifflin county, Pa., May 2, 1837. His father, Gabriel Dunmire, now in his eighty-third year, has always been a resident of the county, holding positions of trust in church and State; he descended from German ancestry, who emigrated to America in its colonial days. His mother, Ann Dunmire, also a native of Mifflin county, Pa., recently deceased, was remarkable for her vigorous and active life, and was of Scotch-Irish extraction, whose ancestors came to this country before the Revolution. From these Christian parents' early instruction, followed by the public and private schools, and later at Williamsport, Pa., have been the sources of his preliminary education. After which he taught school, and continued the study of the languages, with Professor Miller, of Hollidaysburg, Pa. He began the study of medicine with Dr. Bower, of Newton, Hamilton county, Pa. August, 1862, he enlisted as a private in the 125th Regiment Pennsylvania Volunteers, and took part in the following engagements, viz.: Antietam, South Mountain, and Chancellorsville. At the end of nine months he was mustered out at Harrisburg, but re-enlisted as a first-lieutenant, in July, 1863, for three months. Going to Philadelphia, he graduated from the Jefferson Medical College, in March, 1865. Subject of his thesis: "Gunshot Wounds." Re-entering the United States service, as contract surgeon, he was detailed to hospital duty at Chambersburg, Pa. At the close of the war, he began practice on North Seventh street, Philadelphia, afterward removing to Arch street, where he now resides. His start in life, as well as the success he enjoys, has been attained through his self-denying efforts and hard work. For six years he served as district physician to the Philadelphia Dispensary, his work running largely into the ob-

G. Benson Dunning.

stetrical, which has been most successful. During the year 1891, he combined visits to the hospitals in a pleasant tour to England and the different countries on the continent of Europe. In the cholera epidemic of August, 1866, in Phila., his success was about fifty per cent. of recoveries. He has made some researches on *Rhus Toxicodendron*, and on June 17, 1882 (in *Philadelphia Medical Times*), reported a case of proctitis and peritonitis, from rhus poisoning of the buttock. June, 1890, he reported some investigations on the per cent. of mortality resulting from rupture of the uterus, under the caption of, "The Deadly Spur (*secale cornutum*) in Labor." (See Transactions of the Medical Society of Pennsylvania, June, 1890.) He is a member of the American Medical and State Medical Societies, to the latter he was elected treasurer, in June, 1890, which position he still holds. He is also a member of the Philadelphia County Medical, being vice-president in 1878, also member of the Pathological and Obstetrical Societies. He assisted in the organization of the Mutual Aid Association of the Philadelphia County Society, and has been its treasurer since 1882.

DUNNING, Lehman H., of Indianapolis, Ind., is a native of Michigan, and was born at Edwardsburgh, in that State, April 12, 1850. He is a son of Oscar M. Dunning, a substantial farmer. His ancestors were originally English, and settled in the State of New York. His grandfather, Dr. Isaac D. Dunning, was a leading practitioner at Aurora, Erie county, for thirty years, and emigrated to Michigan about 1836. The subject of this sketch was educated at the Edwardsburgh High School, studied medicine two years in the medical department of the University of Buffalo, and completed his course at Rush Medical College, Chicago, where he

graduated with honor in January, 1872, the Faculty making special mention of the thoroughness of his work, as shown by his examination. Dr. Dunning, after graduation, began practice at Troy, Michigan, where he was for a time District Superintendent of Instruction. He was appointed correspondent of the Michigan State Board of Health, and while performing the duties of that office acquired his first experience as a writer on medical subjects which has since proven valuable to himself and the profession. In 1878, feeling himself competent for a wider field, he moved to South Bend, Indiana, where he was soon called into a large and valuable practice. His contributions to medical literature, which had attracted much attention while still a resident of Troy, were continued at South Bend, and gained him a National reputation. A number of these which have appeared in medical journals, and more especially those on surgical diseases of the kidneys, and also on subjects relating to diseases of women, are of great value and did much in giving Dr. Dunning a wide reputation. He took several special courses in New York, and in 1889 made an extensive trip abroad, during which he pursued his studies in the hospitals of Vienna, London and Paris. On his return to this country, at the request of members of the Faculty of the Indiana Medical College, he moved to Indianapolis to accept the position of Adjunct Professor of Diseases of Women, and also to practice his profession with special reference to Gynecological and Abdominal Surgery. On

L. H. Dunning.

the death of Dr. T. B. Harvey, who had held the Chair of Diseases of Women for twenty years, Dr. Dunning was elected his successor, a position which he still fills with credit. He has taken high rank in the State as a teacher and clinical lecturer, and also as a safe and

successful operator in a large number of cases. He is also consulting gynecologist in the City Hospital and the City Dispensary. In May, 1892, he opened a private hospital for the treatment of diseases of women in a large and handsome residence upon North Alabama street. To meet an increased demand this building has since been remodeled and enlarged so that now in all its appointments it will compare favorably with the best private special hospitals of the land. Dr. Dunning is a member of the Marion County Medical Society, the Indianapolis Surgical Society, the Chicago Medical Society, and of the American Medical Association, and has been honored with invitations from about all of them to read papers before them, which he has complied with on numerous occasions. At the ninth session of the International Medical Congress, held in Washington in 1887, he also read a paper before that body which was most favorably received. During the administration of President Arthur, he was a member of the Board of Pension Examiners, at South Bend, and he still does a considerable share of work in State and other associations outside of his regular professional duties. Dr. Dunning was married December 9, 1875, to Miss Harriet Beauchamp, of Edwardsburgh, and has three children.

DUPREE, James William, of Baton Rouge, La., a native of Jackson, La., (of Huguenotic extraction) was born in 1841 and was educated at Centenary College. He received the degree of M. D. from the New Orleans School of Medicine in 1861. In November, 1862, he was appointed assistant surgeon in the provisional army of the Confederate States of America, and ordered to report for duty to General Bragg, and was assigned to duty in the Artillery Corps of the Army of Tennessee. After a short service in this capacity he was invited to appear before the Army Medical Examining Board at Macon, Miss.; passing a satisfactory examination, was made surgeon at the early age of twenty-one years, and until the close of the war, served as chief surgeon of the Artillery Corps in the Army of Tennessee. The war ending, he returned to the Parish of Point Coupee and took charge of the large estate of his mother. In 1867 he located in the city of Baton Rouge, engaging in the practice of his loved profession, where he has ever since remained, enjoying the confidence and esteem of his brother physicians, and of his numerous clientele. In 1879 he was elected vice-president of the Louisiana State Medical Society, and in the following year made president of this honorable body of educated physicians. He has ever taken great interest in State medicine, as evidenced by his labors as chairman of the committee of Health and Quarantine of the General Assembly of the State of Louisiana, of which body he was a member from the Parish of East Baton Rouge. He has been a member of the American Public Health Association since its organization; is a member of the American Medical Association; a member of the Association of Military Surgeons of the National Guard of the United States, and secretary of his local Medical Society. At the New Orleans meeting of the American Medical Association in May, 1885, he was elected State member of its committee entrusted with the organization of the Ninth International Medical Congress and subsequently was ap-

pointed one of the vice-presidents of the Congress. In the midst of his busy professional life he has found time to contribute many valuable papers to medical literature, prominent among which may be mentioned the following: "Bovine Vaccination," "Gunshot Wounds of the Intestines," "Gunshots Wounds of the Stomach," "Tuberculosis, its Etiology and Prophylaxis," "Infant Mortality," "Disposal of Sewage," "Disinfection and Disinfectants." He has been medical officer of the Louisiana State University and Agricultural and Mechanical College for a number of years, and in 1878 was elected Professor of Anatomy, Physiology and Hygiene to said institution, the duties of which he has ably and satisfactorily discharged at all times. In 1887 he was appointed by Governor Nichols Surgeon General of the National Guard of Louisiana, with the rank of brigadier-general, and in 1892 was re-

James W. Dupree

appointed by Governor Foster. As Health Officer of the city of Baton Rouge, during the fearful epidemic of yellow fever in 1878, his efforts were largely instrumental in the creating of the National Board of Health, as the following resolutions offered by him in the Board of Health, at that time, will attest: "Be it resolved, By the Board of Health of the city of Baton Rouge, State of Louisiana, that we hereby urgently solicit the immediate co-operation of all the Boards of Health throughout the entire country to unite with us in an earnest appeal to his Excellency, the President of the United States, to appoint a special commission to investigate the origin, dissemination, and all the phenomena of the prevailing pestilence (yellow fever) with reference to ascertaining the best mode of treatment and the means of preventing its recur-

rence. Resolved, That we hereby solemnly invoke his Excellency, the President of the United States to appoint without delay a special commission to consist of able medical men and skilled chemists to examine the causes, development, progress, and best mode of treatment of the disease now desolating our land; said commission to collate all authentic statistics, whether mortuary, meteorological, sanitary or therapeutical, with any and all information relevant to the end proposed; namely: The discovery of most efficient treatment and the most effective prophylactic agencies, if such be discoverable."

DURGIN, Samuel H., of Boston, Massachusetts, of American parentage, and Scotch-English ancestry, was born in Parsonsfield, Maine, July 26, 1839. He was educated in his native town, and at Pittsfield and New Hampton Academies, New Hampshire, and pursued his medical studies at the Dartmouth and Harvard Medical Schools, graduating M. D. from the latter in July, 1864, and established himself in Boston, where he has since remained engaged in an extensive and successful practice of general medicine. He is a member of the Massachusetts Medical Society, of the Boston Society for Medical Observation, and of the American Public Health Association. From 1867 to 1873 he held the position of Port Physician of Boston, and during the same years was Resident Physician at Deer Island institutions; he has also been a member and chairman of the Boston Board of Health for many years. During the war he was Assistant Surgeon to the First Massachusetts Cavalry, his services extending from July, 1864, to June, 1865. In November, 1875, he married Mary B., daughter of George F. Davis, Esq., of New Bedford, Massachusetts.

DUTCHER, Addison P., of Cleveland, Ohio, son of Josiah Dutcher—the latter a putative grandson of the Brown Dutcher immortalized by Irving—was born in Durham, Green county, New York, October 11, 1818, and died in the former city January 30, 1884. His early education was received at the well-known school of Benjamin Romain—a school whence Paulding, Irving and others scarcely less famous had been pupils. In 1834 he began his professional studies under Dr. John Shanks, of New York; later, entered the office of Dr. Edward H. Dixon, and in 1839—having duly attended lectures—graduated M. D. at the College of Physicians and Surgeons, of New York City. After practicing in Cooksbury, in his native State, and New Brighton, Pennsylvania, he established himself in 1847, in Enon Valley, in the latter State, and was there resident for seventeen years. In 1864 he was tendered the chair of Principles and Practice of Medicine in the Charity Hospital Medical College, Cleveland. This position he accepted and held during two terms, and from 1866 until his death he had been in practice in Cleveland, occupying a leading place in his profession. He was a Fellow of the Cleveland Academy of Medicine, President in 1868; honorary member of the Beaver County (Pennsylvania) Medical Society, President in 1863, and ex-member of the Pennsylvania Medical Society. Dr. Dutcher was active in the movement for the abolition of slavery, and has taken a prominent part as speaker and writer in that for the prohibition of the sale of intoxicating liquors. His contributions to medical literature have been extensive, and while confined in the first

instance to professional periodicals, have been since (in part) issued in book form. The most important of these volumes is "Pulmonary Tuberculosis—its Pathology, Symptoms, Diagnosis, Causes, and Medical Management," 1876. Among his more noteworthy papers are "Epidemic Dysentery," "Incision of Uterine Neck." Sixteen of his lectures, delivered at the Charity Hospital, were also published by request. Among his publications outside of his profession may be mentioned "Selections from my Portfolio—Comprising Lectures and Essays on Popular and Scientific Subjects," 1858; and a series of articles under the title of "Sparks from the Forge of a Rough Thinker," 1880, and "Two Voyages to Europe," the latter being published after his death.

DWIGHT, Nathaniel, of Norwich, Connecticut, was born in Northampton, Massachusetts, January 31, 1790, and died in Oswego, New York, June 11, 1831. He was a brother of Timothy Dwight, the illustrious president of Yale College. The subject of this sketch studied medicine in Hartford, Connecticut, and after practicing there became Assistant Surgeon in the United States Army, and was stationed at Governor's Island, New York harbor. He afterward practiced in Westfield, Massachusetts, and New London and Wethersfield, Connecticut, but in 1812 entered the ministry and was settled in Westchester, Connecticut, until 1820. He then resumed the medical profession and established himself at Providence, Rhode Island, and subsequently at Norwich, Connecticut. Dr. Dwight was one of the first, if not the first physician in this country to propose the present system of asylums for the insane. As early as 1812, when demented persons were still confined in cellars and exhibited like wild beasts, he proposed in a communication to the Connecticut Medical Society the establishment of a "hospital for lunatics." He prepared a school geography, the first published in this country, and was the author of "The Great Question Answered," and a "Compendium History of the Signers of the Declaration of Independence," and made other contributions to general literature.

DWIGHT, Thomas, of Boston, Massachusetts, grandson of Jonathan Dwight, of Springfield, and son of Thomas Dwight, of Boston, was born in Boston, October 13, 1843. He was educated at Harvard University, and also in the medical department of that institution, and graduated in 1867, taking the first Boylston prize for an essay on "Intra-cranial Circulation." After studying abroad for two years he settled in Boston in general practice. He was Instructor in Comparative Anatomy in Harvard in 1872-73, and Lecturer and Professor of Anatomy at Bowdoin from 1872 to 1876. He was also Instructor in Histology at Harvard from 1874 to 1883, and in the latter year succeeded Dr. Oliver Wendell Holmes as Professor of Anatomy. Dr. Dwight is a Roman Catholic, and the first of that faith to hold a Harvard professorship. In 1878 he won the prize of the Massachusetts Medical Society by an essay on the "Identification of the Human Skeleton." In 1880 he became president of the Catholic Union of Boston. He was editor of the *Boston Medical Journal* from 1873 to 1878. In 1884 he delivered a course of lectures at the Lowell Institute on the "Mechanism of Bone and Muscle." His ability as a lecturer is a marked characteristic of the family to

which he belongs. He is a member of the Boston Societies for Medical Improvement, for Medical Observation, of Medical Sciences, of Natural History, and numerous other medical and scientific organizations. He is the author of "Anatomy of the Head," 1876; of "The Structure and Action of Striated Muscular Fibre," in Proceedings of the Boston Society of Natural History, 1873, and of a description of "Balanoptera Muscular (Razor-Back Whale)," in possession of that society (and which was mounted under his direction), and has published various papers of medical and scientific importance.

EADS, Benjamin Franklin, of Marshall, Texas, of English descent, was born March 9, 1833, in Caroline county, Virginia. He received his professional education at the University of Virginia, the University of Pennsylvania, and L'Ecole de Medicine, Paris, graduating from the University of Pennsylvania in 1856. He is a member of the State Medical Association of Texas, and of the Harrison County (Texas) Medical Association. He served in the Confederate Army as Medical Officer, and has since been Surgeon of the Texas and Pacific Railroad Company at Marshall. Dr. Eads is one of the oldest and most accomplished physicians and surgeons in Texas.

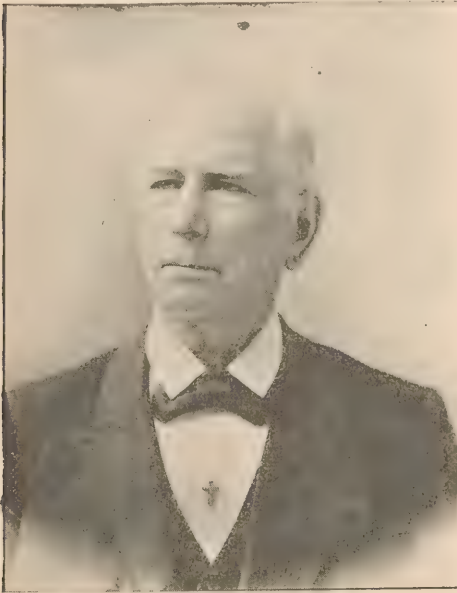

EARLE, Frank B., of Chicago, was born in Lake county, Illinois, October 22, 1860. He was graduated from the High-school in Waukegan, and studied medicine under the preceptorship of his brother, Charles Warrington Earle, of Chicago. After attending two courses of lectures at the College of Physicians and Surgeons, of Chicago, he attended a term at the Jefferson Medical College, Philadelphia, Pa., where he was graduated M. D., in 1885. Soon after this Dr. Earle was appointed attending physician in the West Side Free Dispensary, and Lecturer on the Practice of Medicine in the College of Physicians and Surgeons, which positions he resigned in 1890, in order to devote his entire time to the practice of his profession. He is a member of the Chicago Medical Society, Chicago Pathological Society, and the Medico-Legal Society and the Practitioners' Club, of that city; and also of the Illinois State Medical Society and of the American Medical Association.

EARLE, Pliny, of Northampton, Mass., was born in Leicester, Mass., December 31, 1809, and died at his home May 18, 1892. He was a descendant of Ralph Earle, who with nineteen others, successfully petitioned King Charles, in 1638, for permission to form themselves into a body politic of the island of Rhode Island, and son of Pliny Earle, who made the clothing for the first cotton-carding machines moved by water power in America. He received his literary and classical education at Leicester Academy, Massachusetts, and at Friends' School, Providence, R. I., and pursued his medical studies in the Medical Department of the University of Pennsylvania, whence he graduated M. D. in March, 1837. He first settled in Philadelphia, but shortly after became resident physician to the Friends' Asylum for the Insane at Frankford, Philadelphia county. In 1844 he was appointed superintendent of the Bloomingdale Asylum for the Insane in New York City; in February, 1853, visiting physician of the New York City Lunatic Asylum, Blackwell's Island; and in 1864 superintendent of the State Lunatic Hos-

pital, at Northampton, Mass. In the winter of 1840-41, while at Friends' Asylum, he delivered before the patients a course of lectures upon natural philosophy, illustrated by experiments; the first known attempt to address an audience of the insane in any discourse other than religious. After graduating he paid a first visit to Europe, where he remained two years; one in the medical schools and hospitals of Paris, and the other in a tour of general observation, in which he visited various institutions for the insane, from England to Turkey. He again went to Europe in 1849, and visited thirty-four institutions for the insane in England, Belgium, France and Germany. In 1871 he went a third time, and visited forty-six similar institutions, from Ireland to Austria and Italy. He was one of the original members and founders of the American Medical Association, as well as of the Association of Medical Superintendents of American Institutions for the Insane; the New York Academy of Medicine; and the New England Psychological Society, of which last he was the first president. He was elected a member of the Philadelphia Medical Society in 1837; of the New York Medical and Surgical Society in 1845; of the Massachusetts State Medical Society in 1868; of the American Philosophical Society in 1866; fellow of the New York College of Physicians and Surgeons in 1846; counselor of the Massachusetts Medical Society in 1876; and corresponding member of the Medical Society of Athens, Greece, in 1839. He was also a member of the American Social Science Association. His contributions to medical literature have been voluminous. Among those which have been published in book or pamphlet form are: "A Visit to Thirteen Asylums for the Insane in Europe," 1841; "Blood-letting in Mental Disorders," 1854; "Institutions for the Insane in Prussia, Austria, and Germany," 1854; "Psychologic Medicine, its Importance as a Part of the Medical Curriculum," "The Psychopathic Hospital of the Future," 1867; "Prospective Provision for the Insane," 1868; and "The Curability of Insanity," 1877. Among his papers published in medical journals are: "Climate, Population and Diseases of Malta;" "Medical Institutions and Diseases at Athens and Constantinople;" "The Pulse of the Insane;" "The Inability to Distinguish Colors;" "Experiments to Discover the Psychological Effects of Conium Maculatum;" and "Paralysis Peculiar to the Insane." In 1863 he was appointed Professor of Materia Medica and Psychology in the Berkshire Medical Institute, Massachusetts. He was for several years a member of the Board of Health for Northampton. His medical life was devoted chiefly to the specialty of insanity, being a recognized authority in psychiatry for a half century, and lived to the advanced age of more than four score years to enjoy his well deserved professional reputation. Dr. Earle bequeathed \$60,000 to the city of Northampton as a fund, the interest of which is to be used toward maintaining the Forbes Library in that city.

EARLEY, Charles Richard, of Ridgway, Pa., was born in the town of Scio, Alleghany county, N. Y., May 1, 1823. In 1840 he began reading medicine under the preceptorship of Dr. Randall Reed, of Philipsville, N. Y. The rules of the county medical society at that time required three full years' study in the

office and under the direction of a practicing physician and surgeon, when upon passing an examination by the society the student was permitted to enter upon the practice of his profession; having filled this requirement on March 3, 1845, young Earley entered into partnership with Dr. Brayton Babcock of Friendship, N. Y., for the period of one year, but, owing to the prevalence of considerable sickness including an epidemic of erysipelas and catarrhal fever, their association was extended until April 8, 1846. Soon after this date the subject of this sketch left home for a rest, as his health had become impaired from over work, and by advice went to the lumber region of Elk county, Pa., where he established himself and where he has continued in practice ever since, his first call being on the evening of his arrival in Ridgway, April 11, 1846. He is a graduate of the College of Medicine and Surgery of Cincinnati, 1860, and the Jefferson Medical Col-

C. R. Earley

lege, Philadelphia, 1885. During the Civil War he was appointed assistant surgeon-general of Pennsylvania, rendering service in the hospitals of Philadelphia, and at other points in the State after the battle of Fair Oakes and at the battle of Gettysburg. He has served six terms as a member of the House of Representatives of Pennsylvania, being elected at different periods from 1862 to 1880. He has also served as Superintendent of the common schools of his adopted county, and has done efficient work in promoting the cause of education. It is fair to state that he did not allow these positions to materially interfere with the practice of his profession. Dr. Earley is a man of culture and has a decided taste for general literature. His library, of more than a thousand volumes, contains a rare collection of ancient works. Two volumes of the Sacred Scriptures, of the old and new testaments, in Latin, one an an-

cient manuscript written in the twelfth century on 569 leaves of vellum, the other printed and published in 1478, by Coburger, are valuable and sacred mementoes of antiquity. In the collection are some twenty-five works printed in the fifteenth century. His medical library begins with the writings of Hippocrates and followed by all the standard writers down to the present time. He was a member of Alleghany (N. Y.) Medical Society in 1844 and 1845. In 1871, he became a member of the Lycoming County (Pa.) Medical Society, and he is also an active member of the Pennsylvania Medical Society, the American Medical Association, the Mississippi Valley Medical Association, the Inter-State Medical Congress, the British Association, the Pan American Medical Congress and the West Branch Medical Society. He was a delegate to the International Medical Congress, at Washington, D. C., in 1887, and to Berlin in 1890. In 1849 he first treated cancer (constitutionally and locally) with such success that there was no return of the disease, and has since treated over one hundred cases with like results. The same year he treated snake-bite with olive oil, in accordance with "Gibson's Surgery," which proved a cure, and has been a never-failing remedy in an extensive practice where rattlesnakes and copperheads abound. In 1848, he used olive oil in his treatment for gall-stones with such perfect success that he has never resorted to any other remedy. His treatment of diphtheria, since 1860, has been unusually successful, and has been as much the result of investigating and correcting the bad hygienic environments of the patient as in the use of local and constitutional remedies. Dr. Earley has, at various times, delivered able addresses on educational affairs, and has also contributed important articles to medical journals, and has read papers of great professional interest, before the leading medical societies of this country. Of his papers on medical subjects, may be mentioned those entitled: "Anemia," "Scarlet Fever," "Bleeding in Pneumonia," "Diabetis," 1888; "Croup," 1890; and "Medical Progress," 1891. The last two papers being read at the Nashville and Washington Meetings of the American Medical Association. Dr. Earley is one of those connecting links binding the medical experience of the past with that of the present. His account of the changes in therapeutic measures during his long professional career is not without interest to those who enjoy the advantages of reformed methods of treatment, and it is but simple justice to credit him with having the skill and judgment requisite in the pioneers of our profession to secure this desired result. Referring to his excellent paper, entitled "Medical Progress," published in the *Journal of the American Medical Association*, in 1891, we find when he first entered upon his professional life that it was considered mal-practice to omit bleeding in pneumonia, pleurisy and inflammatory fevers, but his firmness in opposing the measure was rewarded by a more successful and extensive practice. He believes that many diseases, as yellow fever, scarlet fever, phthisis, pulmonalis and diphtheria, thought to be propagated by contagion, are also often developed from bad hygienic conditions, and may arise independent of the former influence. In his day Dr. Earley witnessed the rise and fall of many so-called systems of medicine, and

the sarcastic manner in which he exposes the fallacies and delusions of the "homeopathic," "vita pathic," "magnetic," "eclectic" and "botanic" disciples of the healing art is well worth the attention of every "regular" physician. The "humbugs" perpetrated under the shelter of the words "Christian Science" and "Faith Cure Doctors" have not escaped the keen thrusts of his caustic pen; while in the ranks of our own profession, the warning given against the adoption of many of the recent theories of Pasteur, Brown-Sequard, Koch and others should not go unheeded. His remarks concerning some of the evils of the present system of "specialism," the best methods of combating "quackery," and means to secure the dignity and elevation of modern Medicine and Surgery, particularly deserve the serious consideration of every honorable medical man. Dr. Earley is a man of affairs; has been a large stockholder in a national bank of his adopted town, and has also taken much interest in agricultural pursuits and the raising of stock and prevention and cure of the diseases which affect them. His advice is often sought, and he is frequently called upon to deliver discourses upon subjects of professional and public interest. As a member of the Pennsylvania State Legislature he has delivered many addresses which have been printed and widely circulated. He is a man of generous impulses and of untiring energy, who has been actively engaged in the practice of his profession for nearly fifty years, and now, at the advanced age of three-score-and-ten, lives to enjoy the fruits of his well-earned reputation, while his interest in all that concerns his profession's welfare remains unflagging.

EARP, Samuel Ervingston, of Indianapolis, Ind., was born in Lebanon, Ill., December 19, 1858. He is of English descent, and a son of the Rev. Joseph Earp, of Illinois, a well known and popular minister of the M. E. Church. The education of the subject of this sketch was begun at the early age of five years in a private school in his native town. Later he attended High School at Alton, Ill., and from there took a two years' course of study at Shurtleff College; finally entering McKendric College, at Lebanon, from which institution he received the degree of Master of Science in 1879. During vacations in his college course he also read and studied medicine. After completing his academic education he entered the office of Dr. G. C. Smythe, of Greencastle, Ind., and remained with this distinguished medical preceptor two years. He then attended two sessions of the Central College of Physicians and Surgeons, Indianapolis, Ind., and was graduated from that institution in 1882, as valedictorian of his class. In addition to this high honor he also, upon the same occasion, received the "Waters Gold Medal" as his prize for having passed the best competitive examination on disease of the chest, and a complete and valuable case of gynecological instruments for the best examination in the department of obstetrics and diseases of women and children. Dr. Earp did some creditable newspaper correspondence during his college course, and the good results of his practice in this line may be noted in his fluent and finished professional writing and other literary work in later years. After receiving his medical degree he began the

practice of his profession in Indianapolis, and has continued the same with marked success ever since. He is an active member of the Marion County Medical Society, and the Indiana State Medical Society. In 1882 he was elected Demonstrator of Chemistry in his *Alma Mater*; later, Professor of Chemistry, Toxicology and Clinical Medicine, and finally Professor of Materia Medica, Therapeutics and Medical Chemistry, which latter position he now holds. He has filled the position of editor of the department of Materia Medica and Therapeutics for the *Indiana Medical Journal* several years, and his writings have attracted unusual attention. He is consulting physician to the City Dispensary as well as to the City Hospital and clinical lecturer at St. Vincent's Hospital. He was chemist for the Indianapolis Board of Health in 1885 and 1886, and has served as a member, secretary, and executive officer of the board for several years, having been called to this position by the unanimous

Samuel E. Earp.

vote of the Common Council and Board of Aldermen. He is secretary of the Central College of Physicians and Surgeons, and has been dean of the Faculty, as well as one of the trustees of that institution. In 1891 he was elected by the Metropolitan Board Police Surgeon of Indianapolis, and served in that capacity until the new city charter was established, whereupon he was elected police and fire surgeon by the Commissioners of Public Safety. He is now filling the office with credit and general satisfaction. In the midst of his multifarious duties Dr. Earp has found time for valuable researches in medicine and has been given due credit for original work and discoveries in that direction by authors of medical works and editors of medical journals, and as physician, teacher and public officer, has won for himself a place much higher than usually falls to the fortune of the younger members of the profession. While his tireless energy and great aptitude to his life work are

traits of character that warrant the expectation of still greater achievements from him in the future.

EASTLAND, Orin, of Wichita Falls, Texas, is a native of that State, and was born July 31, 1857. He is a son of Hon. James Eastland, a lineal descendant of Thomas Eastland, who came to this country with William Penn at the founding of Philadelphia. His maternal ancestors are traced to Pierce Butler, of South Carolina, a prominent figure in Colonial days, and signer of the new constitution of the United States. The subject of this sketch studied medicine for three years under the preceptorship of Dr. G. W. Butler, of Palestine, Texas, prior to attending the Missouri Medical College, St. Louis, in the years 1880, 1881 and 1882. In March, of the latter year, he graduated from this college, locating in Gonzales, Texas, from there moving to Wichita Falls, Texas, where he has since resided. He took a special course at the New York Polyclinic in 1887, and in 1890 made an extensive tour in Europe, comprising travel in England, Norway, Sweden, Russia, Germany, Austria, Italy, Switzerland, Belgium and France, an essential feature of which was to attend the meeting of the International Medical Congress at Berlin, as delegate from both the Texas State Medical Association and the American Medical Association, having become a member of the ninth International Medical Congress in Washington, D. C., in 1887. He has served for several years as United States Examining Surgeon, and president of the Board of Medical Examiners for the Thirtieth Judicial District of Texas. He was married in 1888 to Miss Emma Jalonick, of Galveston, Texas. Dr. Eastland has contributed from time to time literature on medical and surgical topics, to be found in the published transactions of the Texas State Medical Association, of which body he was vice-president in 1888 and 1889.

EASTMAN, Joseph, of Indianapolis, Ind., was born in Fulton county, N. Y., January 29, 1842. He is a son of Rilus Eastman and Catherine (Jipson) Eastman, and on his mother's side is of German descent. His early education was confined to winter schools and night study, and before reaching the age of eighteen he became a proficient blacksmith, having worked three years at that trade. On the outbreak of the Civil War he enlisted as a private soldier in the Seventy-seventh New York Volunteers, went to the front and took part in four battles. After the battle of Williamsburg he became a victim of typho-malarial fever, and was sent to Mt. Pleasant Hospital, Washington, D. C., where, after his recovery, he was placed on light duty, and later was discharged from his regiment and appointed hospital steward in the United States army. While thus engaged for three years he attended three courses of medical lectures at the University of Georgetown, where he was graduated M. D. in 1865. He then passed the army examination and was commissioned Assistant Surgeon United States Volunteers, and served in this capacity until mustered out at Nashville, Tenn., in May, 1866. Soon after this, Dr. Eastman located at Brownsburg, Ind., where he was engaged in general practice for seven years. In 1868 he married Mary Catherine, daughter of Thomas Barker, of Indianapolis, Ind. His medical education was supplemented by attending Bellevue Hospital Medical College, where

he was again graduated in 1871. At the request of Drs. Parvin and Walker, of Indianapolis, he then accepted the position of Demonstrator of Anatomy in the College of Physicians and Surgeons, in that city, where he next located in 1875. Soon after this he was appointed Consulting Surgeon to the City Hospital, a position he held for nine years, delivering lectures on clinical surgery to students during that time. He was the assistant of Dr. Parvin, the distinguished obstetrician and gynecologist, for eight years. In 1879 Dr. Eastman was one of the organizers of the Central College of Physicians and Surgeons of Indianapolis, and accepted the chair of anatomy and clinical surgery. After having taught anatomy in the two colleges for seven years, a special chair was established in the last named institution—that of diseases of women and abdominal surgery—which he has held ever since. For the past five years he has been president

Joseph Eastman

of this college. Since 1886, Dr. Eastman has limited his practice to diseases of women and abdominal surgery. His private sanitarium—the outgrowth of this work—has received patients from fourteen different States. During this period of practice Dr. Eastman has opened the abdominal cavity more than five hundred times. He is the only American surgeon who has ever operated for extra-uterine pregnancy by dissecting out the sack which contained the child, and saving the life of both the infant and the mother. (See Hirst's American Obstetrics, Volume 11, pages 269 and 270.) His operations are also referred to in other standard text books, and have been described and discussed in all the leading American and European medical and surgical journals. He has been a frequent contributor to surgical literature ever since 1868, and all his more important papers have been reports of his own work,

some of which have been copied into British journals, and translated and commented upon in Germany and France. Dr. Eastman has originated and perfected a number of instruments for use in abdominal surgery and diseases of women, which are most valuable contributions to this branch of our profession. As a delegate to the International Medical Congress, held in Berlin in 1890, he addressed the Section of Gynecology, demonstrating his method of removing fibroid tumors by the aid of his *hysterectomy staff*, which is now in use by the more advanced gynecologists in Berlin, Vienna and of the hospitals of other great cities. During his stay in Europe he visited the most noted German and Austrian hospitals, as well as those of London and Birmingham, and has among his correspondents a number of the most illustrious gynecologists throughout the world, including such as Dr. Lawson Tait, of Birmingham, Cullingsworth, of London, Briesky, of Vienna, and many others who value his opinions and give him credit for having done much excellent and original work, and for thus advancing the branches of surgery which they pursue in common. Those who have witnessed his capital operations are impressed with his coolness and self-confidence, and in meeting dangerous emergencies with his readiness and ability to do the right thing at the right time and in the right way. These traits, with his accurate anatomical knowledge, have given him a reputation for surgical skill that is second to that of no other American gynecologist. In 1891, as a recognition of his professional merit, the degree of LL.D. was conferred upon him by Wabash College. Dr. Eastman is at present (1893) Chairman of the Section of Diseases of Women, American Medical Association.

EBERLE, John, of Lexington, Ky., was born in Lancaster county, Pa., December 10, 1787, and died February 2, 1838. After receiving such private instruction as the best men of his vicinity could afford, he attended three courses of medical lectures at the University of Pennsylvania in the days of Rush, who was a strenuous advocate for what he styled "a three course" study, young Eberle was granted his diploma. This occurred in 1809, and his thesis for the occasion was devoted to an investigation of "Animal Life." Like almost all young graduates in our profession, says his biographer and colleague, the late Prof. Thomas D. Mitchell, young Eberle no doubt fancied that to obtain a diploma was to be a veritable, money-making doctor *de facto*, and that he had certainly passed the Rubicon. To be sure, he went to work like others in similar circumstances, scarcely dreaming that he had an uphill task in advance that might test his firmness and perseverance not a little. Suffice it to say that the dull round of laborious and unproductive toil, "up hill and down dale," just to feel pulses, did not then exactly suit the proclivity of the young doctor's mind; and hence the fact, that he became editor, and perhaps the proprietor of a political paper, with special reference to a gubernatorial election, that greatly excited the people just at that time. This new relation involved our candidate for political fame in associations by no means calculated to elevate moral character, or even to retain it in *statu quo*. To be an editor then, at such a crisis, was to be identified with all sorts of office-hunters and unprincipled

demagogues, and run into all their excesses. Hence, it turned out, in a very brief space of time, that Eberle, not only lost all his practice as a physician, but was led off into other kinds of practice that threatened for a season to involve him in utter ruin. But roused by some true friends, or awakened by his own reflections to a sense of his imminent danger, he resolved to abandon the county of his birth and to eschew a political life altogether. "This was wise; for, most assuredly, he never perpetrated so great an error as that which drew him from the rounds of professional drudgery into the demagogue life of a thorough-going political editor. But where should he retire to resume professional labors? He had not only lost true friends by his past course, but his purse was sadly deficient; and to locate in a large city, where the expense of sustaining a family, even at that period, was very considerable, seemed to be a very hazardous undertaking. But necessity bows to no legal code it is said, and it so happened that our hero found himself, perhaps even to his own surprise, a denizen of the city of brotherly love. He had very few acquaintances there, perhaps none who could or would render him really valuable aid in such a crisis. He was young enough and had physical force sufficient to encounter the risks and delays incident to professional effort in a new place. Had he retained as much moral and mental energy, in his escape from political life, as the coming emergencies would require? That was the very question which, of all others, most deeply interested Eberle and his growing family just then. To look for patronage from others of his own vocation was hopeless, or nearly so, and he soon realized that if his bark went up stream at all, he must pull the oars, pull hard, and pull constantly. "My first professional acquaintance with Eberle, says Mitchell, was in the summer of 1819, when I resided at Norristown, Pa., and he on Race street, between Eighth and Ninth. He saw a patient who had been for some time under my care, affected with diabetes mellitus, and who, being on a visit to the city, met the Doctor casually and stated his case. This led to a consultation and laid the foundation of my favorable opinion of him as a practitioner. We conversed about some papers of mine that had appeared in the *New York Medical Repository*, then the only prominent medical journal in this country, and also touching some of his that had found a place in another periodical, and thus our literary and professional intercourse had its starting point. He expressed regret frequently that Philadelphia had no journal of its own, for at the period referred to, the *Medical and Physical Journal* of Barton had passed to the tomb of the Capulets, and the *Medical Museum* of Coxe went the way of all flesh. Besides these, there had been two or three ephemeral efforts to get up and maintain a periodical suited to the wants of the profession. This desire on the part of Eberle was the more laudable, since the University of Pennsylvania, located in Philadelphia, and then the medical school of the country, was in itself a reason why an able journal ought to be sustained on the spot. It is hardly necessary to say that, as a consequence of reflections such as these, the *American Medical Recorder* made its debut, under the editorship of John Eberle, M. D., as a quarterly, and was ably sustained by men who were willing to write

without pecuniary reward, and some of whom perhaps owe their after elevation to the efforts of their pen at that time. The first number appeared in the year 1818, and the popularity of the work constantly increased under the auspices of its projector. Many of the most valuable papers ever published in this country are to be found on its pages, and to this day are subjects of reference. It may be proper here to say that not one of the prominent publishers in the city could be induced to undertake the issue of the *Recorder*, even without offering a cent of compensation to the editor. At length the late James Webster, who subsequently became a pretty extensive book publisher, embarked in the enterprise. And, notwithstanding the fact that for years the *Recorder* was the only standard medical journal among us, Dr. Eberle repeatedly assured me that never did its clear avails enable the publisher to pay him five hundred dollars for one year's toil as editor. But for such a man as Webster in the management of the financial concerns, the editor would never have realized a dollar for his services. He made annual tours over the United States, calling on delinquent subscribers for payment of arrearages, and soliciting new names, not by proxy, as is now done, but in person. He narrated to me the particulars of one of his interviews with a subscriber who was indebted for four or five years' subscription, which are so full of interest to all publishers and editors of medical journals, that I venture to introduce the story here. The scene was located in Virginia, and the subscriber was a highly respectable Virginia physician, and possibly there are many now in all the States of the Union in pretty much the same position. After a very polite reception, the Doctor began to find fault with the *Recorder*. 'It has fallen off sadly,' said he, 'and I think I will cease to take it; you ought to have been paid, however, long ago, but the thing passed from my memory.' 'Well,' said Webster, 'I should like to know the particular numbers to which you refer, for we respect the judgment of our patrons, and are glad to take a hint when it may profit all concerned. Please let me see the objectionable articles.' The Doctor mounted a table to reach the lot of numbers piled on the upper shelf of a case, handing them down one by one with rather a bad grace, as the publisher thought. What must have been his surprise, we may conjecture only, to find that in scarcely an instance had the leaves been cut so as to permit a perusal. It is hardly needful to add that the subscriber exhibited tokens of mortification which words could not describe, and that he not only paid his dues, but continued his subscription to the periodical. It was quite soon after the first appearance of the *Recorder* that "Eberle's Therapeutics" came before the public, which was conceded to be, not only in this country, but in distant lands, the very best work on the subject ever issued from the American press. As evidence of the high estimate placed upon it, the work was translated into several foreign languages and has been quoted with marked approbation ever since. In truth, no American work on therapeutics has ever yet been published so full of originality and real excellence. The first edition appeared in 1822, and was executed in the very best style known to publishers at that period, but owing to his financial embarrassment he was compelled to sell it to the

publishers for two hundred and fifty dollars. Anterior to the publication of the work just noticed, Dr. Eberle had been a pretty regular attendant at the meetings of the Philadelphia Medical Society, in the business of which he took an active part. To those who have come on the stage of professional life since the palmy days when the Medical Society flourished, it may be proper to say, that the sessions of the Society were held in the same season with those of the medical department of the University of Pennsylvania, then the only school of medicine in Philadelphia. On Saturday, at half-past seven P. M., the hall of the Society, which for several years was in the basement of the Masonic edifice on Chestnut street, began to receive the usual visitors. These were made up of such men as Dorsey, Parrish, Chapman, Eberle, Colhoun, Cleaver, Rousseau, McClellan, Jackson, Hodge, Rhees, Mitchell, Bell, and Hartshorne, together with a crowd of medical students, anxious to hear the discussions of important questions in theoretical and practical medicine. Near the close of each winter, a committee selected for the purpose, reported a list of lecturers for the weekly meetings of the next session, with the topic of lecture annexed. This list was published in the medical journal of the city, so that all who desired to know who would probably lecture on a certain night might easily gain the information. So, also, at the close of each meeting, the name of the next lecturer and his theme was announced by the secretary, in addition to which a notice of like import was placed in a conspicuous spot in the university edifice. Those whose memory is sufficiently retentive, and who were often present on such occasions, will recollect that Dr. Eberle was not an unfrequent participator in the debates; and while it is conceded that he was neither a finished orator, nor what is usually understood by the term "eloquent," yet he spoke to the point, intelligibly and sometimes with great force. On one occasion he had an opponent, who shall be nameless, who was very fond of quoting the works of old authors quite profusely, without, however, making reference to chapter or page. The gentleman referred to, on one occasion, indulged in this proclivity to a larger extent than usual, and seemed to carry the audience with him, by what sounded like unanswerable argument. It so happened that Eberle, who was vastly more of a bookworm than his opponent, had read every author named in the discussion; and in reply he complimented the last speaker for his apparent familiarity with the ancient writers on medicine." "The authors quoted, or named, rather," said he, "have indeed proved themselves to be true medical philosophers; but it so happens that not one of them wrote on the special theme which my opponent has been professedly discussing. There is not an attempt made by any of them to argue the question now before us; and I pledge my veracity for this statement." Such were substantially the remarks then made; and in an instant the tables were turned, and the laurels were obviously won by Eberle. As it could not subserve the cause of truth or science to disguise the fact, it should be stated that during a portion of the period that has passed in review, there were two professional parties in the city, each vigorously contending for the mastery. There was but one medical school; yet such were the feelings engendered

from various causes, which need not be named, that a determination was deliberately formed, as early as 1822, that Philadelphia should have a second school of medicine; and this purpose had its rise with men who were educated in the parent school. Intimately related to this scheme were the regular courses of lectures given by Drs. Eberle and George McClellan, in the old Apollodorian gallery of Mr. Rembrandt Peale, in the rear of his residence on Walnut street, opposite Washington Square. These lectures were well attended, and the lecturing powers of the persons named were thus made familiar to the profession. Referring to the establishment of this new enterprise Dr. Mitchell writes: "Often had I conversed freely with Eberle and McClellan in the city, in respect of the contemplated school; and they understood me perfectly in the premises. Unexpectedly, both paid me a visit at my residence in Frankford, avowedly to press me more closely to the advocacy of the cause. The daily papers had already opened a pretty fierce discussion of the merits of the case; and it was desired by both the individuals named that my pen should come to their aid. This service was rendered with all the energy that I was able to carry into the contest, and like the productions of the opposite party, under a fictitious signature. It is needless to conceal the fact that all this zeal in the incipency of the enterprise was, more or less, prompted by an expectation of being a component part of the faculty at the outset. Nothing less than this, as part of the scheme of the gentlemen, could have been inferred from our interviews; and yet it is a matter of history that, in this respect at least, it was my lot to be disappointed. And when I call to mind the jars and contentions, the hard speeches and lawsuits that marred the prospects of the school for years after its organization, I feel quite satisfied that my connection was providentially deferred to a more convenient season. As will always be the case, diverse views were advocated in respect of the contemplated new school, especially touching its cognomen, location, and the corporate powers under which it should be conducted." As the ball was rolled on, it increased in magnitude and importance, and many influential friends gave in their adhesion to its interests. The press teemed with essays pro and con, while the legislature was invoked, by all the considerations that party zeal could adduce, to interfere so as to defeat the purpose of the adventurous aspirants who dared to call in question the vested rights of a century. But the labor was in vain. The spirit and genius of democratic institutions was triumphant; and under the wing of the literary establishment at Canonsburg, known as Jefferson College, the school No. 2 of that great city, found a local habitation and a name; and so long as the Jefferson Medical College of Philadelphia shall exist will the name of John Eberle be identified with its rise, and also, to some extent, with its progress. Within its walls he taught *materia medica*, and also the theory and practice of medicine, and both with marked ability. It was during the period of his connection with the Jefferson Medical College that Dr. Eberle issued his well known work on the Theory and Practice of Medicine, for which, as his fame was well established, he received a more liberal compensation than his

Therapeutics yielded. It was the only Philadelphia issue on practical medicine, in two octavo volumes that had ever appeared, professing to be original to a great extent, and not a mere reprint of a foreign work, with the addition of a few brief notes. Hence the demand for it was very extensive, so that it reached the fifth edition prior to his decease, and found a place in almost all the respectable libraries of the profession, in all sections of the country. Like his *Therapeutics*, this larger work became a text-book in various colleges, and had his life been prolonged, it would probably have been much enlarged, and in keeping with the progress of the science. In close connection with the work on the Practice of Medicine, appeared a small volume intended as a kind of *vade-mecum* for the student, and known by the title of "Eberle's Notes." It was a duodecimo, containing the skeleton of his course on theory and practice. It had a fair sale in this city, and was so much sought for in the West, in 1832, as to require the issue of a new edition. It so happened that the success of the new school was not equal to the anticipations of its founders, and especially did it disappoint the subject of this memoir. How much aid its annual revenue contributed to the support of his family we know not; yet a conjecture, not far from reality, might be made, from the fact that, as a sort of last effort to swell the number of matriculates, a Western teacher was engaged to give a course of lectures on theory and practice, in the session of 1830-31, for the sum of one thousand dollars. It is to be presumed that the existing faculty made the maximum offer of compensation in this instance, and even exceeded the actual resources of the school. It was an experiment. The fame of the teacher so engaged was a basis on which it was fondly hoped the reputation of the college would not only rest securely, but in virtue of which the seats would be filled to a larger extent than at any previous period. But the result was sheer disappointment, although the number of pupils was somewhat augmented. "Hope deferred," it is well said, "makes the heart sick;" and Dr. Eberle, chagrined at the lack of good fortune in his favorite enterprise, was ready for any reasonable proposition whose tendency might be to improve his pecuniary condition. His family expenses had been considerably increased by the education of his sons at Jefferson College, in Canonsburg, and by other outlays, incidental and unavoidable, and he was actually in debt at the period now passing in review. He was therefore quite willing to hear anything like a hopeful proposition for a change. Early in the session already named (1830-31), the scheme of a new medical school in Cincinnati was laid before him, decorated with all the tinsel and ornament that the high-wrought imagination of a very sanguine individual could append, and Eberle took hold of it at once, and was induced to accept a chair in the medical department of Miami University, purposefully intended as a rival, if not the annihilator of the Medical College of Ohio. This was consummated in December, 1830, Dr. Drake being then a temporary teacher at Jefferson, and dean of the faculty of the projected Ohio school. In the fall of 1831, Eberle reached Cincinnati and entered on the duties of his chair, not, however, in the school first named, for it so happened that an amalgamation of

schools took place, and the professors selected in Philadelphia found themselves in the old Cincinnati school, the Medical College of Ohio. "As a rival," writes Mitchell, his colleague, "we were positively assured that our matriculating list would be at least two hundred; but here too was disappointment, for, even under the far more promising arrangement effected by the union of the schools, the number of pupils, all told, was one hundred and fifty, the pay class scarcely exceeding one hundred and thirty." This deficit in expectation, raised but a few months before, soured the mind of Eberle not a little, and had a most unhappy effect on his deportment and general habits, from which he never after recovered. Truthfulness requires a bare reference to this matter, but details are not necessary, and so we pass the subject. It was during the new collegiate relation that the work on the Diseases of Children went to the press. For this, however, he received very little better compensation than that derived from his "Therapeutics." But the publication was an experiment, in which no book house had previously engaged in that city. The work was stereotyped, and had as good a sale as could have been anticipated; all the work of disorganization had been commenced in the college, and the influence of party spirit could not be favorable to their sale, even if it did not diminish it. As a necessary consequence of the movements against the school, its classes waned sadly, and Eberle was doomed again to vexation of spirit, with the concomitants that too often follow in its wake. During his connection with the Medical College of Ohio, the *Western Medical Gazette* was projected, the editors being Eberle, Staughton, and Mitchell. This periodical was sustained, as to its literary feature, almost exclusively by the pens of the editors, and reference to its pages will show how largely the subject of this memoir contributed to give it popularity and value. His articles on "Diagnosis" were especially prized, and no doubt caused numerous additions to the subscription list. So also in the Ohio Medical Lyceum, founded at the same period, Eberle put forth his best energies, in papers read and discussed, thus offering additional inducements to the medical pupil. But the mutations of medical schools had not yet ceased. Not only did the Medical College of Ohio rock to its center, so that its walls shook even to the foundation, but its rival, the school of Lexington, Kentucky, now trembled under the ruthless hand of revolution. A portion of its faculty sought a more quiet home in Louisville, to found an institution for the very purpose of blasting the hopes of the remaining props and friends of Transylvania. To insure the greatest amount of success, they detached from the Ohio school its Professor of Anatomy, who enjoyed a fair reputation in that department, electing at the same time Dr. Mitchell to the Chair of Chemistry, and urging his acceptance of the same with great zeal. Just at this juncture, the individual last alluded to was chosen to the Professorship of Chemistry in the school of Lexington, and after a lapse of a week, the chair of Theory and Practice was filled by the appointment of Dr. Eberle, with a guarantee of four thousand dollars per annum for three years. It is needless, perhaps, to say that he accepted the new post, and so vacated his place in the Medical College of Ohio. A

stranger would be very apt to conclude that, however disastrous and unsatisfactory had been his anterior connections, Dr. Eberle was now in the very position to meet all his reasonable wishes, and to render his family comfortable and happy. The annual stipend was regarded as ample, considered especially in connection with the low prices of all articles of living at the time, the cheapness of house rent, and ordinary requirements. Then, too, the anticipations for the school itself were encouraging. The Medical College of Ohio was broken to fragments, and a new school was operating in the same city against it. The Institute of Louisville, formed by the professors ejected from Transylvania, was a sheer experiment, whose success was, to say the least, quite doubtful in the judgment of many. And despite all its array of means, possessed and in prospect, the class of Transylvania for 1837-38, the year of Eberle's induction, numbered not over twenty less than the roll of the previous session. These were encouraging features beyond cavil, but unfortunately his health became impaired, and his death occurred within a few months after. As a public teacher no one could venture to affirm that Eberle was very interesting, exceedingly sprightly, nor even tolerably eloquent. In his palmy days he knew how to interest a class by throwing his whole soul into the subject. He had an important advantage over some teachers in this respect; he always made the hearer feel that he understood his subject in all its bearings. He was anything but a good reader, but could happily blend reading with extemporizing when he was in the right mood. To this course he resorted sometimes from necessity. "I called," says Mitchell, "to see him once on professional business an hour before the time of his regular lecture. His manuscript was before him, and he appeared to be in a brown study. Said he, 'I was up all night and got home but a few minutes ago, and here are just seven pages for an hour's lecture.' 'Well, how will you manage,' said I, 'to fill your hour?' To which he replied, 'I have a bad cold, and shall be obliged to cough and use my handkerchief frequently, and to swallow a mouthful of water as often as I can. With these expedients, joined to the use of as much loose talk as I can command, I shall be able to eke out the hour with seven pages. I have done it before, and can do it again.'" As a debater, he was just what I have elsewhere intimated when speaking of the Philadelphia Medical Society. His accurate knowledge of authorities fully compensated for the deficiencies of utterance and expression, which would otherwise have rendered his efforts less effective. Touching his qualities as writer and practitioner, my opinion has been abundantly expressed already, and to say more would be superfluous. As a man, one of his most prominent defects was a lack of decision. Hence it occurred, no doubt, that he was severely censured for the erratic course of the Jefferson College in its early history, when, in fact, the difficulty had its rise in the facility with which others could operate upon him to accomplish their purposes. I am the more disposed to this view of the case from a full personal knowledge of his demeanor in the troubles of the Medical College of Ohio from 1831 to 1835. It was impossible to approbate his course at that trying crisis, yet it was pal-

pable that he was less, by far, of an original actor in the scenes than a passive subject to be moulded by designing individuals. Herein consisted his grand defect, as one invested with administrative powers, and whose professional position might have influenced others under different circumstances, to have pursued a better course. The defect alluded to, rather than any fixed purpose to do wrong to others, was the basis of a large portion of the censure which was so freely dispensed to our departed colleague. "Faithless," continues Mitchell, the biographer previously quoted, "would we be to truth and the welfare of the young men of the medical profession, did we keep utter silence touching a failing of Eberle, that overshadowed his whole history, and brought him to a premature grave. For more than ten years anterior to his immigration to Ohio, he had acquired the deleterious habit of opium-eating. In moments of calm reflection he saw his danger and made a sort of effort to extricate himself from the sad dilemma in which habit had involved him. But his resolutions were mere ropes of sand, that held him to his purpose of reform a few days or weeks at most. From one stimulant and narcotic he flew for relief to another, till finally his entire nervous system was crushed irrecoverably, and he died, an old man, in the meridian of life. It was our purpose to have suppressed this sad item of the history of one, who, but for the error to which we have referred, might have filled a much more conspicuous niche than has been allotted to him. But it seems to us as though our task would not be discharged, if we kept the youthful aspirant for professional fame in ignorance of the sad mistake by which the subject of this memoir cast a somber hue across the pathway of life, despoiling the fairest prospects, not only in respect of himself, but of all who were dear to him.

EDENHARTER, George Frederick, of Indianapolis, Ind., was born in Piqua, O., June 13, 1857, and is of German descent. His preliminary education was received in the public schools of Dayton, O. He studied medicine with Dr. Frank Morrison, of Indianapolis, and was graduated in medicine at the Indiana Medical College of that city, in 1886, and successfully practiced his profession with his former preceptor, until 1890. He was physician to the Marion County Asylum, from 1886 to 1888, and physician to the Marion County Work-House from 1888 to 1889. He was also elected a member of the city council in 1884, and re-elected to the same position in 1886. In 1887, he was unanimously nominated candidate for mayor of the city, by the Democratic Convention, and such was his popularity that in the race for the office he led the ticket by a thousand votes, and was only defeated by a small plurality. At a joint convention of the common council and board of aldermen, held in 1890, and composed of twenty-one Democrats and fifteen Republicans, he received their unanimous vote for the position of Superintendent of the City Hospital for the term of two years. During this time the law was changed, vesting the power to select candidates for this office in the Board of Health, and at their meeting in December, 1892, was again elected to fill this position. Referring to the management of the Indianapolis City Hospital, the *Indiana Medical Journal* (December, 1892), says: "This institution was never in

better order than under the present superintendent. Dr. Geo. F. Edenharter is a master of the multitudinous details that make perfect a modern hospital. The surgery is a model for any institution of like character to copy. In it are a hundred devices showing the superintendent's thoughtful care and ingenuity. The operating-table, the serving-table, the sterilizing apparatus, the arrangement and supply of instruments, the dispensing of medicines, the pathological and clinical laboratory, the system of signals are all devices of the superintendent. Over and above all this, the patients are not neglected. The writer has asked scores of them, when presented at the clinic, how they liked the City Hospital. There is never any complaint. The hospital is becoming popular among the poor. They have no fear of it, and are ready to go there

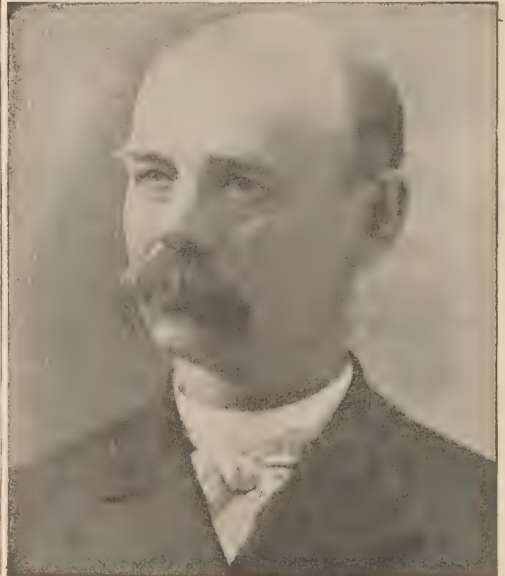

when sick. The relations existing between the superintendent and the internes and the training-school for nurses are of the most friendly and helpful kind." Dr. Edenharter is a man of fine professional accomplishments, and of excellent business capacity, and is in accord with the great philanthropic movements of the day. In the execution of his duties he is firm, but kind; the rules he has formulated are obeyed. Under his care this public charity is honestly, faithfully and economically managed, and is a credit to the profession and the city, and affords a welcome refuge for those entitled to its benefits. Since writing this sketch, a vacancy occurred in the superintendency of the Indiana Central Hospital for the Insane, occasioned by the death of the late Dr. C. E. Wright. This hospital contains about two thousand patients and employes,

and is the largest asylum of the "single-building" order in this country. In April, 1893, Dr. Edenharter was unanimously elected by the Board of Trustees as the Superintendent of this institution, a position which he still holds, and is filling with a marked degree of success and satisfaction.

EDES, Robert Thaxter, of Boston, Mass., was born at Eastport, Me., September 23, 1838. His family is of English descent. His literary education was received at Harvard College from which he was graduated in 1858. He studied medicine under the preceptorship of Dr. Benjamin Cushing and received his medical degree from the Harvard Medical School in 1861. He entered the United States Navy at the beginning of the Civil War and served as assistant and past assistant surgeon, chiefly in the West Gulf or Mississippi Squadron until June, 1865. He then visited Europe and supplemented his medical education at Vienna, after which he located at Hingham, Mass., and practiced his profession until 1869, then settled in Boston, afterwards (1886) in Washington City, D. C., and finally established himself again at Boston. He was attending physician at the Boston City Hospital from 1872 to 1886. He has also been attending physician to the Garfield Memorial Hospital, Washington, D. C. He was Professor of Materia Medica in Harvard University from 1871 to 1883, and Professor of Clinical Medicine in the same institution from 1883 to 1886. He is Resident Physician at Adams Nervine Asylum, Jamaica Plain, Mass. He is a member of numerous medical and scientific organizations. He is the author of "Nature and Time in the Cure of Diseases," 1870; and "Physiology and Pathology of the Sympathetic Nervous System," 1871; "The Massachusetts Medical Society Prize Essay," and the "O'Reilly Prize Essay" respectively. He is also the author of the "Therapeutic Handbook of the United States Pharmacopeia," 1883; and a text-book of "Therapeutics and Materia Medica," 1887. The articles on the Kidney and Apoplexy in Peppers' "System of Medicine," Volumes IV and V, were written by Dr. Edes, as well as "Cold Bathing in Typhoid Fever," in Publications of the Massachusetts Medical Society, 1875, and in Reports of the Boston City Hospital, and many other articles in the medical journals.

ELDER, Elijah S., of Indianapolis, Ind., was born in Dillsborough, Indiana, March 17, 1841. On his father's side he is a descendant of a member of Lord Baltimore's party, who settled in Maryland in 1634. His great-grandfather, Dele Elder, was a Continental soldier in the Revolutionary War. On his mother's side his earliest ancestor in America was one of the Kerrs, who came from England in Colonial times and were active patriots in the struggle for national independence. His father, Dr. Samuel Fletcher Elder, was a physician of distinction. His mother, Nancy Kerr Elder, was the daughter of David Kerr, Esq., who settled near Wilmington, Ind., in 1813. His parents removed to Mount Auburn, Ind., where the son was educated in the common and graded schools. At the age of eighteen he passed his examination for a teacher's certificate of the first-class, and then taught school in Shelby county for two years. During the next two years he was engaged in mercantile business at Mt. Auburn. He was appointed United States Provost Marshal for Shelby

county and Assistant Provost Marshal for the Sixth Congressional District, Indiana, in 1863, and held these positions until the close of the war. He studied medicine with his father, and in the fall of 1865 entered the Medical College of Ohio, from which he graduated in 1867, after attending two full terms. Dr. Elder began practice at Morristown, Ind., and remained there until 1875. He then attended lectures at Bellevue Hospital Medical College, from which institution he received the degree of M. D., *Ad Eundem*, in 1876. In July of this year he went to Indianapolis, Ind., where he has ever since resided and devoted himself to his profession. Dr. Elder helped to organize the Shelby County (Ind.) Medical Society, of which he was vice-president. He became a member of the Rush County (Ind.) Medical Society in 1870, and was its vice-president in 1872, its president in 1873-74, and was afterward made an honorary member of the society. He became a member of the Indiana State

Elijah S. Elder.

Medical Society in 1867, and was elected secretary thereof in 1879, in which capacity he has served the society continuously from that date to the present time. Dr. Elder became a member of the American Medical Association in 1878, and still holds his membership in that body. He is a member of the Marion County (Ind.) Medical Society, in which he has held the offices of secretary, vice-president and president. He is president of the Mitchell District Medical Society, and is connected with several other medical and scientific organizations. In 1876 Dr. Elder was elected Lecturer on Diseases of Children in the Medical College of Indiana, and in 1888 was elected Professor of Principles and Practice of Medicine in that institution, which chair he still fills. He has been dean of the college since 1890. He has also for many years been a member of the staffs of the Indianapolis City Hospital and the City Dispensary. In 1880 he was elected a member of the Indianapolis Board of Health, and was president of that body

until 1882, when he was made its secretary and executive officer, which position he held until 1885, when he resigned on account of his connection with the Indiana State Board of Health. He was elected secretary and executive officer of the Indiana State Board of Health in 1884, and held the position until 1886. During his connection with the board its work attained such a degree of efficiency as to gain the commendation of all parties. He was an active member of the American Public Health Association and other sanitary bodies during his official connections with the State and county boards, whose annual reports, issued under his direction, attest his great energy and recognized ability in the field of sanitary science. Since 1891 he has been president and general manager of the Indiana Medical Journal Publishing Company. Dr. Elder has always been an active and progressive member of his profession. He has furnished numerous papers and articles for the various societies with which he has been connected. Among these were papers on the following topics, which have been published in the transactions of the State Medical Society, in the reports of the State Board of Health and in the American Public Health Association's reports: "Morbo-Lacteo," "Immediate Placental Delivery in Natural Labor," "Placenta Previa," "Occult Hemorrhage and Malpresentation," "Pyrexia and Hyperpyrexia," "Typhoid Fever," "Sanitary Survey of the School Houses of Indiana," "Sanitary Supervision," "Small-pox," "Diphtheria" and "Erysipelas." He was married to Miss Kate Lewis, daughter of John Lewis, Esq., of Edinburgh, Ind., in 1867. Two children were born to them in 1868 (twins), both of whom died in infancy. Their married life has been remarkably pleasant and happy. Dr. Elder has devoted much time and study to the collateral sciences, especially Anthropology, Ethnology and Geology. His contributions on these subjects to various societies have been numerous and attracted favorable attention. He is a member of the Indiana Academy of Science. In 1890 De Pauw University conferred on him the degree of A. M. Dr. Elder has been an active and an official member of the Methodist Episcopal Church since his boyhood. He has been a member of the Masonic fraternity for twenty-five years, is a Knight Templar and a Thirty-second Degree Scottish Rite Mason. The Doctor enjoys travel, and has, in his annual summer vacations, visited nearly every part of the United States and Canada. He is a thorough sportsman, and relishes a few weeks of "roughing it" every year. His physical organization is unimpaired, and promises many more years of vigorous life.

ELLINWOOD, Charles Norman, of San Francisco Cal., was born at Cambridge, Vt., April 12, 1838, and is of English parentage. He was graduated at the Rush Medical College, Chicago, in 1858, and supplemented his medical education and training in the School of Medicine, Paris, France. He first established a practice in Chicago, and in association with Dr. Powell, started the first Free Dispensary in that city, as well as the first clinic of Rush Medical College. During the Rebellion he served as surgeon of the Seventy-fourth Illinois Infantry. In 1867 he removed to California and has been engaged in active practice in San Francisco for the last twenty-

six years. In 1872 he became surgeon of the United States Marine Hospital service at that city, and is now surgeon of the city and county hospitals, and a member of the faculty of Cooper Medical College. Dr. Ellinwood is also a member of numerous medical and scientific organizations, medical director of the Home Benefit Life Association, and has contributed important articles on medical subjects to the leading journals of his profession.

EMMET, Thomas Addis, of New York, was born May 29, 1828, at the University of Virginia, where his father, Dr. John Patton Emmet, was then Professor of Chemistry and Materia Medica. He is a grandson of the famed Thomas Addis Emmet, and a grand-nephew of Robert Emmet, whose genius and fate immortalized his name. He received his education at a preparatory school at the University of Virginia, and in a school at Flushing, Long Island, under the charge of the Rev. Francis L. Hawks, completing it by a partial course in the academical department of the University of Virginia, after which, in 1845-6, he entered the Jefferson Medical College, Philadelphia, from which he graduated in 1850, serving afterwards as resident physician in the Emigrant Refugee Hospital, Ward's Island, near the City of New York, for two years, before the expiration of which, however, he was appointed in 1852 one of the visiting physicians to the same institution, serving in this capacity for three years. In the fall of 1852 he commenced the practice of medicine in the City of New York, where he has since continued it. In 1855, shortly after the building was opened for a hospital, under the charge of the Woman's Hospital Association, he became attached to the institution as assistant surgeon to Dr. Sims. In 1862 he was appointed surgeon-in-chief. This institution was afterwards merged into that under the charter of the Woman's Hospital of the State of New York, and the present hospital was built and organized under his direction. He remained at its head until May, 1872, when it was thought advisable to place the hospital in charge of the Board of Surgeons, of which he was made a member, and on which he has since served as visiting surgeon. He was appointed in 1876 one of the consulting physicians to the Roosevelt Hospital of the City of New York. Since 1859 he has devoted his attention to the treatment of the diseases of females as a specialty. He is a permanent member of the New York State Medical Society; member of the New York County Medical Society; Medical and Surgical, and Gynecological Society, of New York, as well as the Academy of Medicine of that city, and has been president of the New York Obstetrical Society. His principal contributions to medical literature comprise the following productions: "Calcareous Deposition on the Surface of the Heart, with References as to the manner in which the Blood is Propelled from that Organ," 1855; "On Œdema Glottidis Resulting from Typhus Fever," 1856; "Silver Ligatures and Sutures," 1859; "A Radical Operation for Procidencia Uteri," "Treatment of Dysmenorrhœa and Sterility," 1865; "Reduction of Inverted Uteri by a New Method," "Accidental and Congenital Atresia of the Vagina, with a Mode of Operating for Successfully Establishing the Canal," 1866; "Inversion of the Uterus with a New Mode of Procedure to be Adopted as a Last Resort,"

"Vesico-Vaginal Fistulæ from Parturition and other Causes, with Cases of Recto-Vaginal Fistulæ," 1868; "Surgery of the Cervix," "Inversion of the Uterus," 1869; "A Case of Ovariectomy—the Pedicle Secured with Silver Wire by a New Method," 1870; "A Rare Form of Spina Bifida, Presenting Features in Common with an Ovarian Cyst," "Prolapsus Uteri, its Chief Causes and Treatment," 1871; "Chronic Cystitis in the Female, and a Mode of Treatment," 1872; "Laceration of the Perineum, involving Sphincter Ani, and Operation for Securing Union of the Muscle," 1873; "Philosophy of Uterine Diseases," "Laceration of the Cervix Uteri, as a Frequent and Unrecognized Cause of Disease," 1874; "Treatment and Removal of Fibroids from the Uterus by Traction," 1875; "Etymology of Uterine Flexures, with the Proper Mode of Treatment Indicated," 1876; "Proper Treatment for Lacerations of the Cervix Uteri," "Removal of Fibrous Tumors from the Uterus by Traction," 1877, and "Pelvic Inflammation," read before the American Gynecological Society, Baltimore, September, 1886, and "Certain Mooted Points in Gynecology," read before the British Medical Association the same year. But the work upon which his fame chiefly rests as an author, is his treatise entitled "Principles and Practice of Gynecology" (1879, third edition revised, 1884.) This work passed through three editions in London and has been translated into German, 1881, and French, 1887.

R. W. Erwin.

ERWIN, Robert W., of Bay City, Mich., was born May 24, 1842, at Laceyville, Ohio. When seventeen years old, after five months' attendance at an academy in Hagerstown, Ohio, he taught school. The following spring and summer he attended normal school at Hopedale, Ohio, succeeding which he taught school in winter and worked on his father's farm in summer.

At twenty-one years of age he was elected treasurer of Stock township, Harrison county, in his native State, and, in addition to his school work, was appointed a quasi-superintendent of all the schools in the township. He later enlisted in the 170th Regiment Ohio Volunteer Infantry, as it entered the field, taking his place in the ranks. In February, 1865, he was enrolled as a student in the Ohio University, at Athens, graduating in 1868. His grade in the college won a free scholarship for the Senior Year. The study of medicine, previously begun, was continued at Bellevue Hospital Medical College, New York City, receiving the degree of M. D., February, 1870. During this time he occupied the chair of Geometry in Cooper Institute, New York. In April following graduation he was married to Julia E., daughter of Dr. E. G. Carpenter, Athens, O., and began practice in the same town. He was appointed United States examining surgeon in 1872; resigned and removed to Bay City, Mich., in December, 1873, where he has since continuously resided. In the earlier years of professional life he was a frequent contributor to current medical literature. With the exception of being for a time connected with the City Board of Health, he has not sought nor held any official position. He is a non-resident member of the Ohio State Medical Society, member of the American Academy of Medicine, Michigan State Medical Society, and others.

ETHERIDGE, James Henry, of Chicago, Ill., is a native of the Empire State, being born at Saint Johnsville, Montgomery county, March 20, 1844. His father, Dr. Francis B. Etheridge, was born in the town of Herkimer same State, and was a son of a Revolutionary soldier, and the descendant in the fourth generation of English parents. The mother of our subject, Fanny Easton, was a native of Connecticut and the sixth generation from England. Dr. Francis B. Etheridge was a practicing physician forty-seven years. He moved to Hastings, Minnesota, in 1860, and was a surgeon in a Minnesota regiment during the Civil War, dying in Hastings in 1871. The subject of our sketch, who is a prominent physician of Chicago, and a member of the faculty of Rush Medical College, received most of his education in his native State, and had some experience in teaching a winter school. He was prepared in mathematics and Latin to enter the Junior year in Harvard College, but the breaking out of the war and the absence of his father in his country's service disarranged the son's plans and he concluded to go no further in his classical studies, but turn his attention to medicine. He read four years with his father, attended three full winter courses at Rush Medical College, Chicago, and was graduated in March, 1869. In preparing for practice, he had taken careful and exhaustive courses, and on receiving his medical degree, stepped almost immediately into a fair business, in the thriving village of Evanston, near Chicago, where he remained between one and two years. At the end of that period he made a tour of Europe, walking the hospitals of some of the largest cities, spending several months in London alone. On returning, Dr. Etheridge settled in Chicago, July 31, 1871, and was elected to the chair of Therapeutics, Materia Medica and Jurisprudence in Rush Medical College. This chair he retained until

J. H. Etheridge.

1889, when he was elected Professor of Gynecology, the successor of the late Prof. Wm. H. Byford. In the year 1892, he was also elected to fill the chair of obstetrics, making his professorship in Rush Medical College that of Obstetrics and Gynecology, the position which he holds at present. Dr. Etheridge was elected president of the Chicago Medical Society in 1886, and president of the Chicago Gynecological Society in 1890. He is at present the Professor of Gynecology in the Chicago Polyclinic. He is Attending Gynecologist to the Polyclinic Hospital, to the Presbyterian Hospital, and is Consulting Gynecologist to the St. Joseph Hospital, Chicago. He is a constant contributor to the medical journals of the day, and is a member, not only of the Chicago city societies, but of the State, National, International and Pan-American medical associations. He is also a foundation and life member of the International Association of Obstetrics and Gynecology, whose first meeting was held in Brussels in September, 1892. Dr. Etheridge was married June, 1870, to Harriet Elizabeth, daughter of the late Herman G. Powers, of Evanston, Ill., and they have two children, both daughters.

EVE, Duncan, of Nashville, Tenn., was born May 1, 1853, in Augusta, Ga. He received his literary education at the Kentucky Military Institute and University of Nashville; his medical training was also at the University of Nashville and Bellevue Hospital Medical College, New York City. He remained in New York City after his graduation in 1874, and served as "Interne" in both the Ninety-ninth Street and Bellevue Hospitals. Soon after returning home (Nashville, Tenn.) in 1876, he organized the Nashville Medical Col-

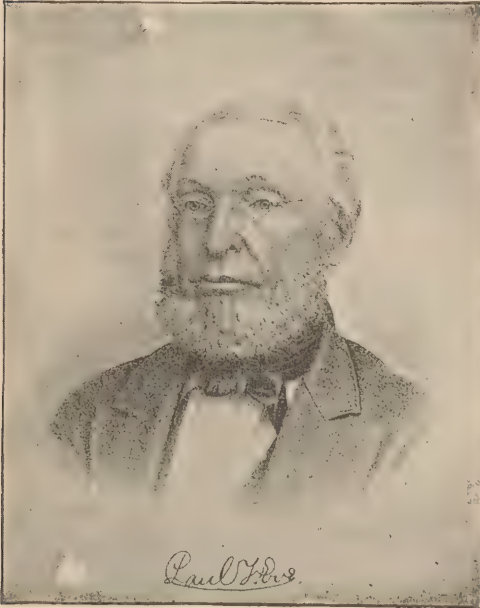

lege, now the Medical Department of the University of Tennessee. He drew off his distinguished father, the late Dr. Paul F. Eve, from the University of Nashville, and with him, Drs. W. K. Bowling, T. B. Buchanan, J. Berrian Lindsley, W. P. Jones and others, began an institution whose success has seldom been equaled, having had during the last year over 300 students. Dr. Duncan Eve has been the Dean and Professor of Surgery ever since the organization of the Medical Department of the University of Tennessee. In 1877 he accepted the Professorship of Microscopy in the Tennessee College of Pharmacy, a position he was compelled to resign in two years' time, having too many irons in the fire. Among the other positions of honor held by Dr. Eve may be mentioned the following: He was permanent secretary of the Tennessee State Medical Society for a number of years; vice-president of the Davidson County Medical Society, 1884; chairman of the surgical section of American Medical Association, in 1885; first vice-president of the American Medical Association, and presided at the Cincinnati meeting in 1889; and president of the Tennessee State Medical Society in 1890. He was also vice-president of the Southern Surgical and Gynecological Association. He is surgeon to all the railroads entering his city, and surgeon to the City, St. Margaret and Good Shepherd Hospitals. In 1888, to obtain better hospital advantages, Dr. Eve entered municipal affairs and was elected to the city council, and while serving as a member was president of the council, and afterwards mayor of the city. Dr. Eve devotes his time exclusively to surgery, and is doing one of the largest practices in the South or West.

Duncan Eve.

EVE, Paul Fitzsimmons, of Nashville, Tenn., was born near Augusta, Ga., June 27, 1806, and died in the former city, November 3, 1877. He

was a son of Captain Oswell Eve, and is of English-Irish descent. Having graduated A. B. and LL. D. from the University of Georgia, in 1826, he became an office student under the celebrated Dr. Charles D. Meigs; he at the same time entered the Medical Department of the University of Pennsylvania, and was graduated thence M. D. in the spring of 1828. After practicing medicine for a year in Georgia, he sailed for Europe, and until May, 1831, prosecuted his professional studies in London and Paris; in London, under Sir Astley Cooper, Abernethy and Johnson, and in Paris under Dupuytren, Larrey, Roux, Velpeau and others. In May, 1831, political events in Europe had reached a crisis. While in Paris he had witnessed the dethronement of Charles X., and had "participated professionally" in the revolution of July, and when the Russian advance was made upon Poland, he determined to offer his services to the latter country—"remember-

Paul F. Eve.

ing," as he himself says, "how the gallant Pulaski had fallen at the siege of Savannah, during our own Revolutionary War." After a short detention at Berlin, he was permitted, by means of letters from Lafayette, chairman of the Polish committee of Paris, but especially through the intervention of Dr. Carl Fred. von Graefe (himself a Pole), surgeon to the king—to proceed to Warsaw, and upon arriving in that city was at once assigned to hospital duty. For unremitting devotion to duty, he was promoted to be surgeon of the Fifteenth Infantry Regiment, and was made surgeon of ambulances in General Turno's division. At the instance of the chief of the Medical Bureau, he was decorated with the golden cross of honor. After the fall of Warsaw, September 8, 1831, he was for thirty days a prisoner within the Prussian lines, on the plea of cholera. He returned to Paris, and in November sailed from Havre for New York. He organized the

Medical College of Georgia, and from 1832 to 1849 was professor of surgery in that institution; in 1850, was called to succeed Professor Gross in the chair of Surgery in the University of Louisville, but after one course resigned this position, because of the illness (terminating in the death) of his wife. In 1851 he was made Professor of Surgery in the University of Nashville, then being organized, and during the ensuing ten years he discharged the functions of this office. In 1868 he was called to the chair of Surgery in the Missouri Medical College, but after two courses of lectures was compelled, by the severity of the climate, to resign his professorship, and returning to Nashville, was tendered the chair of Operative and Clinical Surgery in the university, holding this position until 1877, when he accepted the chair of Principles of Surgery and Diseases of the Genito-Urinary Organs in the newly-founded Nashville Medical College (now the Medical Department of the University of Tennessee). His position as a leading surgeon of the southwest, naturally made him the recipient of requests from various institutions to become a member of their several faculties, and in accepting the professorships already mentioned, he was compelled to decline calls from the Philadelphia Medical College, the New Orleans Medical College, the Memphis Medical College, the Ohio Medical College, in Columbus, and the University of the City of New York. During his forty-five years of professional life, he never missed the delivery of a single lecture. No surgeon in the South held a higher position or did a larger practice of surgery than Dr. Eve. He crossed the Atlantic fourteen times in the interest of his profession. So far as can be determined Dr. Eve was the first American surgeon to make successfully hysterectomy, the first to remove the crista-gally, and had remarkable success as a lithotomist; of 146 bi-lateral operations for stone in the bladder, only eleven terminated fatally. He trephined the lateral sinus of the brain, and by tracheotomy and with forceps successfully removed a nail from the left bronchus; introduced a simple canula needle for applying ligatures and sutures, and relieved extroversion of the female organs of generation. He was president of the Tennessee State Medical Society in 1871; president of the American Medical Association in 1857-58, and at the International Medical Congress held in Philadelphia in 1876, was distinguished as special representative of surgery. His professional publications have been numerous, embracing some six hundred articles. His most important works are "Remarkable Cases in Surgery," 1857; "One Hundred Cases of Lithotomy," Transactions American Medical Association, 1870; "What the South and West have Done for American Surgery," and the report of twenty amputations and thirteen resections at hip-joint (performed by Confederate surgeons), contributed to "The Medical History of the War." He was also for a time editor of the *Southern Medical and Surgical Journal*, and assistant editor of the *Nashville Medical and Surgical Journal*. In 1846 he was the first volunteer surgeon appointed to serve in the Mexican War. In 1859 he visited Europe; went direct to the seat of war, was at Magenta and Solferino, and contributed the results of his observations to the *Nashville Medical and Surgical Journal* for 1859. In November, 1861, he was

made surgeon-general of Tennessee; served also as surgeon to Johnson's Hospital, and as a member of the army medical examining board; on the fall of Nashville was made surgeon to the Gate City Hospital, of Atlanta, Ga.; was ordered to the field at Shiloh during the battle; subsequently served at Columbus, Miss., again at Atlanta, and finally at Augusta, Ga., being stationed at the latter city upon the termination of the war. He was at the time of his death preparing a text-book on surgery. He died aged 71, leaving two sons, Duncan and Paul F. Eve, Jr., to succeed him.

EVERTS, Orpheus, of College Hill, Hamilton county, O., was born in Union county, Ind., December 26, 1826. He is of English and Dutch lineage, and his father, Dr. Sylvanus Everts, was a distinguished physician of Rutland county, Vt. The medical studies of the subject of this sketch were pursued at Laporte, Ind., and at the Indiana Medical College, from which institution he was graduated in 1846. He subsequently received the honorary degree of M. D. from the University of Michigan in 1865, and from Rush Medical College in 1867. He practiced six years in St. Charles, Ill., and then removed to Indianapolis, Ind. He was Presidential Elector from Indiana in 1856; register of land office, Wisconsin, from 1857 to 1861. He was appointed surgeon of the Twentieth Indiana Infantry soon after the outbreak of the Civil War, and served four years in the field. He was on staff duty with brigade, division and corps, and, with the exception of Bull Run and Antietam, was present at all the battles of the Army of the Potomac. Dr. Everts is a member of numerous medical societies, including the American Medical Association. After the close of the war he devoted especial attention to psychiatry and diseases of the nervous system. He was appointed Superintendent of the Indiana Hospital for the Insane in 1868, and served in that capacity for many years. He is recognized as one of the most eminent neurologists of this country, and has been a frequent contributor of articles on other subjects to periodical literature. He is now superintendent of the Cincinnati Sanitarium, a widely known but private institution for the treatment of nervous diseases, insanity, inebriety and the chloral and morphine habits.

FAIRCHILD, David S., of Ames, Iowa, of English ancestry, some of whom were among the earliest settlers in Bridgeport and Fairfield, Conn., was born in Fairfield, Franklin county, Vt., September 16, 1846. He was educated at Barre, Vt.; studied medicine in the University of Michigan, from 1866 to 1868, and graduated from the Albany Medical College, December, 1868. He settled, first in High Forest, Minn., in 1869; removing to Ames, Iowa, in 1872, where he has been in continuous practice since. He assisted in organizing the Story County Medical Society, and was its first president. He is a member of various local medical organizations, of the State Medical Society, American Medical Association, and the National Association of Railway Surgeons. He was a member of the International Medical Congress in 1876. He was chairman of a committee appointed by the State Society to prepare a "History of Medicine in Iowa," in 1876, which was completed. He has prepared papers for various medical societies and medical journals. In 1877 he was appointed Phy-

sician to the Iowa Agricultural College, and in 1879 was elected Professor of Physiology and Comparative Anatomy in the same institution. In 1881 he was elected Professor of Histology and Pathology in the Iowa College of Physicians and Surgeons, at Des Moines. In 1885 he was transferred to the chair of Pathology and Diseases of the Nervous System, and in 1888, to the chair of Practice of Medicine and Pathology. He was appointed Division Surgeon for the Chicago and Northwestern Railway, in 1884. His practice is at present confined chiefly to consultations. In May, 1870, he married Wilhellmina C., daughter of Hon. W. K. Tattersall, of High Forest, Minn.

FERGUSON, Frank C., of Indianapolis, Ind., was born in Hendricks county, Ind., October 24, 1843. He is of Scotch descent, his great-grandfather on his father's side having emigrated from Scotland to Virginia anterior to the Revolution. His father, James Ferguson, was born near Stony Point, Va., and emigrated to Indiana when quite a young man, where he married Zelinda Darnell, who was born in Kentucky. In 1862, when eighteen years old, the subject of this sketch entered the Union Army, serving three years as a non-commissioned officer in Company C, Seventieth Indiana Volunteers. He participated, with his regiment, in the hard-fought battles of the Atlanta campaign, and marched with Sherman to the sea. At the close of the war he returned home and taught in the public schools four years, during which time he studied medicine. In 1870-71 he attended a full course of lectures in the Miami Medical College, of Cincinnati, O., and in the spring of 1871 he commenced the practice of medicine as an undergraduate at New Winchester, Ind. In 1872 he removed to Carbon, Clay county, that State, where he had a wide and varied professional experience among the coal miners of that region. In 1875 he removed to Brownsburg, in his native county, where he did an extensive and successful general practice. In 1881 he removed to Indianapolis, where he attended a full course of lectures and graduated at the Medical College of Indiana in March, 1882, and was valedictorian of his class. In September of the same year he issued the first number of the *Indiana Medical Journal*, which he conducted successfully for ten years. During the winter of 1888-89 he attended the New York Polyclinic and the clinics of the various hospitals of that city, devoting his studies exclusively to gynecology and abdominal surgery. In 1889 he visited London and Paris. Returning home, he was elected Adjunct Professor of Obstetrics and Clinical Midwifery in the Central College of Physicians and Surgeons. Dr. Ferguson is a member of the American Medical Association, the Indiana State Medical Society, and the Marion County Medical Society. In 1872 he was married to Matilda, daughter of James A. Bowen, of Danville, Ind. Dr. Ferguson now has charge of a private sanitarium, and limits his practice to obstetrics, gynecology and abdominal surgery, in which field he has attained excellent success and is well and widely known, not only in the city of his residence, but throughout his State.

FITCH, Graham N., of Logansport, Ind., died there November 28, 1892, aged eighty-four years. He was born in LeRoy, New York, in 1808, and was one of the most notable men of

Indiana. His grandfather was a soldier of the Revolutionary War, and his father in the War of 1812. The subject of this sketch was educated at Middlebury, and at Geneva College, completing his medical studies at the College of Physicians and Surgeons, New York. He began the practice of his profession in his native town, in 1832. In July, 1834, he located in Logansport, Ind. Dr. Fitch was a member of the Indiana Legislature, in the sessions of 1836-37 and 1839-40. He three times served as presidential elector. In 1844 he was appointed to a Professorship in Rush Medical College at Chicago. From 1848 to 1852 he was a Representative to Congress from his district. From 1856 to 1861 he was United States Senator. While in Congress he saw the gathering sectional cloud, and pointedly warned the South of the fatal consequences to them of the war they seemed to desire. In the Presidential election of 1860, Senator Fitch advocated the election of John C. Breckinridge, of Kentucky, who was a candidate of the South. This action was misconstrued, and he was heralded as a rebel sympathizer. His action was explained by his adherence to Democracy and his unwillingness to support Stephen A. Douglas, the northern Democratic candidate, for personal reasons. There had been a difficulty between the two in the Senate, resulting in the sending of a challenge by Douglas to Fitch. The latter promptly accepted, but as his marksmanship was unerring, friends of Douglas interfered, and while the duel never came off, the feeling continued. Thus the support of Breckinridge and the misconception it led to. When the war broke out Senator Fitch organized the Forty-sixth Regiment Indiana Volunteers, and assisted in filling two other regiments. With his regiment he was placed under General Buell's command at Louisville, Ky.; later he joined General Pope, and was immediately put in charge of a brigade. He participated in the sieges of Fort Thompson and Island No. 10. After the fall of these posts he was detailed, with his brigade, to lay siege to Fort Pillow, in conjunction with the navy under Commodore Davis. The day following the fall of Fort Pillow, Colonel Fitch captured and garrisoned Memphis. A few days afterward he moved up White River, Arkansas, and captured, by assault, the fortifications at St. Charles. At the last place he took prisoner the wounded commander of the Confederate batteries, the unfortunate Colonel Fry, of Cuban notoriety. Colonel Fitch had two sharp engagement with the Confederates in Arkansas, in both of which he was victorious. An injury received in that State, by the fall of his horse, while on a reconnoitering expedition, compelled him to leave the service before the expiration of the war. He was an ardent Democrat, but never hesitated to dissent from his party when, in his judgment, its course was not for the best interests of the country. Many years ago he retired from all active participation in politics. Dr. Fitch was a man of diversified talent, and capable of meeting promptly extraordinary emergencies; illustrative of this, one of his personal friends relates, that on one occasion at Logansport, in 1852, when the doctor was making a political speech during his race for Congress, a messenger called him from the stand to attend a man who was dangerously injured by the explosion of a steam boiler. Excusing

himself, he asked the audience to remain seated twenty minutes. At the end of the specified time the doctor returned, reporting that he had amputated the patient's leg, dressed the stump, and assuring the anxious people that the unfortunate victim was doing well, and would recover, calmly resumed the thread of his argument as unconcerned and as little disturbed as if nothing at all had happened. As a public officer he always fearlessly and faithfully performed every known duty. As a physician and surgeon few men have been more actively engaged, or met with greater success, and he continued to practice his profession for the good of humanity until his last illness. He was a member of the Medical Convention, which met in Philadelphia, in May, 1850, for the purpose of revising the United States Pharmacopeia, as a delegate from Rush Medical College, Illinois, and was appointed upon the Committee on Revision and Publication. He attended many of the meetings of the American Medical Association from an early date, among the last were those at Atlanta and Chicago. He occupied the chair of Professor of Principles and Practice of Surgery in the Medical College of Indiana, for four years, and was Emeritus Professor at the time of his death.

FITCH, Thomas Davis, of Chicago, Ill., was born in Troy, Bradford county, Pa., July 14, 1829. He is a son of Lewis Haines Fitch, and a direct descendant of Governor Thomas Fitch, first Colonial Governor of Connecticut. His early education was received in his native town and in Knox College, Galesburg, Ill., to which State his father had removed in 1846. He studied medicine with his uncle, Dr. Charles Badger, of Mishawaka, Ind., commencing in October, 1848; attended lectures at the Rush Medical College, Chicago, during the session of 1850-51; also private courses of lectures given by Drs. A. B. Palmer and N. S. Davis. In 1851 he married Harriet W. Skinner, of Laporte, Ind. He graduated from the Rush Medical College M. D. in 1854, having previously practiced in Withersfield, Ill. In 1854 he removed to Kewanee, in that State. In December, 1861, he entered the army as surgeon of the Forty-second Illinois Infantry, a position he held till May, 1863, when he resigned on account of illness in his family. He removed to Chicago on May 1, 1864, where he has continued in the active practice of his profession until the present time. His practice is general, but he has given special attention to gynecology. He is a member of the Illinois State Medical Society, has been its president; served on some of its principal committees, and been its permanent secretary for seven years. Was a member and organizer of the Henry County Medical Society, which was merged into the now large and influential medical society known as the Military Tract Medical Association of Illinois; he served as its president and secretary. He is a member of the Chicago Medical Society, has been its president and secretary; of the Medico-Historical Society; American Public Health Association; Medical Press Association, one of its directors; and the American Medical Association. He was also a member of the Medical Board of the Cook County Hospital, and has served as its secretary and president. He is the author of "Perineal Pressure to Facilitate Labor," published in the Transactions of the Illinois State Medi-

cal Society; "Report on Gynecological Instruments;" "Infantile Constipation;" "Report on Specialties and Medical Advertising;" and "Antagonism of Opium and Quinia," read before the Chicago Medical Society, 1865, as well as numerous other important articles in medical periodicals. He was Physician to Cook County in 1865-66, and County Supervisor in 1867, and has held the position of Attending Surgeon and Clinical Lecturer on Surgery in the Cook County Hospital from 1867 to 1870, and that of Attending Gynecologist and Clinical Lecturer on Obstetrics and Diseases of Women and Children in the same institution. Was one of the Consulting Surgeons to the Chicago Hospital for Women and Children, from its organization in 1865 to 1870; was one of the originators of the Woman's Hospital Medical College, of Chicago, which was organized in 1870, in which he has filled the chair of gynecology and the office of trustee. He has been Attending and Consulting Physician of the Washingtonian Home for the Reformation of Inebriates for many years.

FITHIAN, Enoch, of Greenwich, formerly of Bridgeton, N. J., died at his home in that State, November 15, 1892. He was born in May, 1792, and was the oldest graduate of the Medical Department of the University of Pennsylvania, having been a member of the class of 1815. He continued in medical practice in Cumberland county for fifty years, or until about thirty years ago. He was the first secretary of his County Medical Society, and afterwards became its presiding officer. After his retirement from active practice, Dr. Fithian gave much time to local historical subjects, and he has left behind him many pages of retrospective local interest. He was said to be the oldest living Free Mason in the United States, his tenure of membership having covered fully seventy-five years. At the last election Dr. Fithian, with assistance, went to the polls and cast his eightieth annual ballot. One day in May, 1892, he celebrated his centennial birthday.

FLETCHER, William Baldwin, of Indianapolis, Ind., was born in that city August 18, 1837. His father, Calvin Fletcher, settled there in the woods in 1821, and soon became prominent in his profession—a lawyer, and foremost in public work, being among the first to aid in starting churches, Sunday-schools, and other institutions essential to the people's welfare. He was active in establishing a public school system, and introduced the law which put a public library in every township in the State. Dr. Fletcher was a pupil at the new log school house, located in a beautiful woods where New Jersey and South street of his native city now intersect, and afterward at the old County Seminary, located on the South side of University Square. He inherited from his father a love of nature, of animals, trees, and plants, and like him was a student of nature from choice and love of it. He prepared for Harvard College in 1855, but instead of entering he studied, under Agassiz and Tenney, zoology, botany, and other branches of natural science, by which he laid a good solid foundation for his studies in medicine afterward. These he pursued at the College of Physicians and Surgeons in New York, from 1856 to 1859, graduating in October of the year last named. He came home and remained until the troops to suppress the Rebellion were

called out in 1861. He was among the first to go, and when his regiment, the Sixth Indiana, took the field, was detailed for duty on the staff of Gen. T. A. Morris. He was next transferred to the staff of Gen. J. J. Reynolds, and placed in charge of the secret service, a duty requiring great tact, skill, and hard work, and at the same time one of no small peril. Captured while on detached duty, he was brought in irons before Gen. Robert E. Lee, kept in solitary confinement six weeks, made two attempts at escape, was wounded and in October, 1861, tried, court-martialed, condemned to death and ordered to execution. The prisoner was, most fortunately for himself, reprieved by General Lee pending a further investigation. By a still more fortunate piece of luck and through the blunder of the sergeant, afterward Captain Wirtz, his identity as a special prisoner was lost to the Confederates. He was placed in charge of the Gangrene Hospital near Richmond, and in March, 1862, was paroled. Dr. Fletcher resumed the practice of his profession at Indianapolis, but during the entire war the best of his skill and talents were freely given to the Sanitary Commission, the State, or general government, wherever the need was greatest. In this way he gave aid at the battle fields of Perryville, Stone River, at Vicksburg and in many other places, doing medical and surgical duties, bringing home the sick and wounded and working faithfully in all emergencies where the services of a skilled physician and surgeon were in such great demand. In 1866 Dr. Fletcher visited Europe and studied in the hospitals of London, Paris, Glasgow, and Dublin, during that and the following year. For nineteen years he has been a professor in various departments of the Indiana Medical College, and is now Professor of Mental Diseases in the Central College of Physicians and Surgeons. He is a member of the American Medical Association, of the New York Medical-Legal Society, of the Indiana State Medical Society, and of the State Microscopical Society, of which he was the first president. He also belongs to a number of other societies and associations of a high standard. Dr. Fletcher established the Indianapolis City Dispensary in 1870, was for many years visiting surgeon or consulting physician to the City and St. Vincent Hospitals, and has in the course of his professional career found it incumbent on him to do a large amount of work. In 1882 Dr. Fletcher was elected a State Senator from his county, being one of the candidates on the Democratic ticket. In 1883 he was made superintendent of the Indiana Hospital for the Insane, a position he held for four years. During this time the institution made great advances. Among other very humane and beneficent ideas introduced was the abolition of restraints as a means of treating insanity. He was among the first in the West to recognize the advantages of having a woman physician in charge of insane women, and was the first superintendent of a hospital for the insane in his State to appoint a woman on the medical staff. He has written extensively and well on the care and treatment of the insane as well as upon other branches of medical science. He has also done some writing in general literature which, though fugitive and off-hand, is far above the average in point of literary merit. In 1888 he established at In-

dianapolis a private sanitarium for the treatment of mental and nervous diseases, known as "Dr. Fletcher's Sanitarium" where he continues his work in the chosen branches of his profession.

FLINT, Austin, Sr., of New York City, was born in Petersham, Mass., October 20, 1812, and died March 13, 1886. He was descended from Thomas Flint, who came to America from Matlock, Derbyshire, England, in 1638, and settled in Concord, Mass. Edward Flint, physician, of Shrewsbury, Mass., was his great-grandfather. His grandfather, Austin Flint, after whom he himself and his son are named, was a physician, who died at Leicester, Mass., in 1850, having passed ninety years of age. In the struggle of the Colonies for independ-

Austin Flint.

ence he took a patriotic part, serving in the Revolutionary army, first as a private and afterwards as a surgeon. The father of the subject of this sketch was Joseph Henshaw Flint, a distinguished surgeon of Northampton, Mass., and afterward of Springfield, in the same State. Austin Flint, after pursuing collegiate studies at Amherst and Cambridge for three years, entered the Medical Department of Harvard College, and, pursuing a full course, received his degree of M. D. from that institution in 1833. He was married in 1835 to a daughter of N. W. Skillings, Esq., of Boston. In 1836 he established himself in practice in Buffalo, having meanwhile practiced in Boston and Northampton, and, both by his success in the treatment of disease and by his

publications, rapidly brought himself into prominence in his profession. In 1844 he was appointed to the chair of the Institutes and Practice of Medicine in the Rush Medical College, Chicago; but this position he relinquished at the expiration of a year. The *Buffalo Medical Journal*, with which his name is most commonly associated, was founded in 1846, and during the ensuing ten years he conducted it with marked ability and success. In 1847 he was associated with Professors White and Hamilton in founding the Buffalo Medical College, an institute in which, until 1852, he was Professor of the Principles and Practice of Medicine and of Clinical Medicine. In the latter year he accepted the chair of the Theory and Practice of Medicine in the University of Louisville, a professorship that he retained until 1856, when he resumed his connection with the college at Buffalo as Professor of Pathology and Clinical Medicine. From 1858 to 1861 he passed the winters in New Orleans, holding the positions of Professor of Clinical Medicine in the New Orleans School of Medicine and Visiting Physician to the Charity Hospital. In 1859 he removed from Buffalo, establishing himself in New York City, where he remained the rest of his life. He was appointed in 1861 one of the physicians to the Bellevue Hospital, and Professor of the Principles and Practice of Medicine and of Clinical Medicine in the Bellevue Hospital Medical College, having previously been appointed Professor of Pathology and Practical Medicine in the Long Island College Hospital. The former position he held until his death; he resigned the latter position in 1868. In 1872 he was elected president of the New York Academy of Medicine, and held that position until 1885, when he resigned on the adoption of the medical code sanctioning the consultation with physicians other than the "regular" school. He was a member of the leading American medical and scientific societies, and a corresponding member of various European organizations of similar character. He was a delegate to the International Medical Congress, which assembled in Philadelphia in September, 1876, and was one of the orators, preparing and delivering the address on "Medicine." It was received with marked attention and the highest appreciation, which it eminently merited, being in all respects a most masterly effort. He was president of the American Medical Association in 1884, and attended the Medical Congresses held in London in 1881 and in Copenhagen in 1884, and had been elected to preside at the Congress to be held in Washington in 1887. As an author he has materially aided the advance of his profession. Among his works may be mentioned "Clinical Reports upon Continued Fever, Chronic Pleurisy and Dysentery;" "Physical Exploration and Diagnoses of Diseases Affecting the Respiratory Organs" (two editions); "A Practical Treatise upon the Pathology, Diagnosis and Treatment of Diseases of the Heart" (two editions), and his celebrated "Treatise upon the Principles and Practice of Medicine," first published in 1866, and republished, for the fifth time, in 1881, and of which more than forty thousand copies have been sold. Two of his essays, "On the Variations of Pitch in Percussion and Respiratory Sounds," and "On the Clinical Study of the Heart Sounds in Health and Disease," received the first prizes

of the American Medical Association in 1852 and 1859. His later publications are: "Essays on Conservative Medicine and Kindred Topics," 1874; "Phthisis: Its Morbid Anatomy, Etiology, Symptomatic Events and Complications, Fatality and Prognosis, Treatment and Physical Diagnosis, in a Series of Clinical Studies," 1875; "A Manual of Percussion and Auscultation," 1876; "Clinical Medicine: a Systematic Treatise on the Diagnosis and Treatment of Disease," 1879; "Physical Exploration of the Lungs by Means of Auscultation and Percussion," 1882, and "Medical Ethics and Etiquette," 1883. His works are regarded as authority on the subjects of which they treat.

FLINT, Austin, Jr., of New York City, was born at Northampton, Mass., March 28, 1836, and his parents removed to Buffalo, N. Y., in the same year. He was educated at private schools in that city, and, when fifteen, he spent a year in the Academy of Leicester, Mass. He

Austin Flint, Jr.

prepared for college at Buffalo, and entered Harvard University as Freshman, in 1852. He left the university in 1853, and spent a year in the study of civil engineering. He began the study of medicine in the spring of 1854, at Buffalo, and attended two courses of lectures at the Medical Department of the University of Louisville, from 1854 to 1856. His taste for physiology was early developed, and he made some experiments on living animals, for Professor Yandell, of the Louisville school, while he was a student there. His final course of lectures was taken at Jefferson Medical College, Philadelphia, in 1856-57, and at the close of the course he graduated. His inaugural thesis on the "Phenomena of the Capillary Circulation," was honored with the recommendation to be published, and appeared in the *American Journal of Medical Sciences*, in July, 1857. It was based upon numerous original experiments.

He was editor for three years (from 1857 to 1860) of the *Buffalo Medical Journal*, which was founded by his father in 1846, and ultimately transferred to New York and merged in the *American Medical Monthly*. In 1858 he was appointed one of the attending surgeons of the Buffalo City Hospital. The same year he became Professor of Physiology in the Medical School of Buffalo. In 1859 he removed with his father, and was appointed Professor of Physiology in the New York Medical College, delivering a course of lectures in 1859-60. In 1860 he received the appointment of Professor of Physiology in the New Orleans School of Medicine, delivered a course of instructions in 1860-61, and resigned the position at the breaking out of the war. While in New Orleans he experimented on alligators, and developed some important points with reference to the influence of the pneumogastric nerves upon the heart. He also made some experiments there upon the recurrent sensibility of the anterior roots of the spinal nerves. He was the first physiologist in this country to operate upon the spinal cord and the spinal nerves in living animals. In the spring of 1861 he went to Europe, and studied several months with Charles Robin and Claude Bernard, with the former of whom he had close friendly and scientific relations, and maintained a frequent correspondence. Professor Robin presented his memoir, "Sur une Nouvelle Fonction au Foie" ("On a New Function of the Liver"), to the French Academy of Sciences, for the Monthyon prize, without the knowledge of the author. In 1863, Dr. Flint made some important experiments upon the blood, employing a new mode of analysis for its nitrogenized constituents. He was one of the founders of the Bellevue Hospital Medical College, in 1861, and became Professor of Physiology and Secretary and Treasurer of its Faculty, and has held the chair of Physiology in this institution during the last thirty-two years. He was also for eight years professor and lecturer on Physiology in the Long Island College Hospital of Brooklyn. In 1862 he made some remarkable observations on the excretory functions of the liver, published in the *American Journal of the Medical Sciences*, in October, 1863; translated into French, and presented by Robin to the French Academy of Sciences for the *Concours Monthyon*, and which received honorable mention, and a recompense to the author of fifteen hundred francs, in 1869. The important discovery put forth in this memoir was the production of cholesterine in the physiological wear of the brain and nervous tissue, the elimination of cholesterine by the liver, and its discharge in the form of stercorine in the feces. It was established that the new substance (stercorine) results from the transformation of cholesterine in the feces. The diseased condition caused by the retention of cholesterine in the blood (cholesteremia) is now recognized as a very important pathological fact. Dr. Flint's laborious researches and interesting conclusions upon this subject have been lately confirmed in Germany by experiments in which cholesteremia has been produced in animals by injection of cholesterine into the blood. In 1867, at the request of the Commissioners of Public Charities and Correction of New York City, Dr. Flint reorganized the dietary system for the institutions under their charge including

Bellevue Hospital, Charity Hospital, Poor-house, Work-house and Penitentiary, making diet tables for more than ten thousand persons. In 1871 he made observations upon Weston, the pedestrian, analyzing his food and secretions for fifteen days before, during and after one of his great walking exploits. These inquiries help to decide some important physiological questions. In 1869 he published an elaborate review of the history of the discovery of the motor and sensory properties of the roots of the spinal nerves, in which the discovery was ascribed to Magendie instead of to Sir Charles Bell, who has generally been regarded as its author. This review, originally published in the *Journal of Psychological Medicine*, New York, in 1868, was translated into French and published in Robin's *Journal de l'Anatomie*. It produced such an impression that it was soon followed by the publication, in the English *Journal of Anatomy*, of the original paper of Charles Bell, "Idea of a New Anatomy of the Brain," which was privately printed (not published) in 1811. The original manuscript was furnished to the *Journal of Anatomy* by the widow of Sir Charles Bell. It was upon this paper that the claims of Charles Bell to the discovery were based; and, before its publication in *Journal of Anatomy*, it had been entirely inaccessible. Claude Bernard has been the eminent advocate of the theory that the liver is a sugar-producing organ; but observations upon this subject were discordant, and eminent physiologists contested Bernard's position. In 1869 Dr. Flint published, in the *New York Medical Journal*, a series of experiments upon the "Glycogenic Function of the Liver," in which he endeavored to harmonize the various conflicting observations, and is considered by most physiologists to have settled the question. In 1866 he announced the publication of the "Physiology of Man," a work in five volumes, of 500 pages each, and the last volume was issued in 1874. He printed a little work in 1870 on "Chemical Examinations of Urine in Disease," which went through several editions. He contributed the articles on "Gymnastics and Pugilism," "On the Physiological Effect of Severe and Protracted Muscular Exercise," 1871, and in 1876 published a voluminous "Text-book of Human Physiology," of which several editions have been issued. He has also written much for scientific periodicals and popular journals, and has been actively engaged in his duties as a physiological teacher. In 1875 he was appointed Surgeon-General of the State of New York by Governor Tilden, and was reappointed in 1877 by Governor Lucius Robinson. He is the medical examiner, for the city of New York, of the Connecticut Mutual Life Insurance Company, and has been since 1871. He is a member of the New York Academy of Medicine, the Medical Society of the State of New York, and correspondent of the Academy of Natural Science, of Philadelphia.

FLORENTINE, Frank B., of Saginaw, Mich., is a native of Illinois, having been born in the city of Chicago, June 16, 1849. His parents, Joseph and Cecile Florentine, were born in Orleans, France, and emigrated to the United States in 1849, the Doctor being born soon after the arrival of the family in Chicago. From the age of seven to twelve our subject attended the common school, and then the high school. At the age of fifteen he entered

the service of his country, in March, 1865, and served one year as a private in Company H, Fifty-Eighth Illinois Infantry, and was mustered out in March, 1866, at Montgomery, Ala. Upon his return to Chicago he decided to attend secular schools for five years longer, at the same time keeping up the study of medicine under the late Prof. Moses Gunn, of Chicago, and afterward with Dr. D. K. Cornell, of St. Louis, Mo., also taking special studies and pursuing a course at Bourbonnais College and Kankakee High School. Afterward he taught school for awhile at Kankakee, Watseka, Beaver and Pleasant Grove, Illinois. Later he spent some time in the college at Eureka, in that State, where he attended to his classical studies. In 1872 the Doctor went to Paris, France, in order to complete his classical studies, remaining there eighteen months; then upon his return

Frank B. Florentine.

home he entered Rush Medical College, Medical Department of the Northwestern University of Chicago, being graduated therefrom in 1876. Only a few weeks after he graduated from the latter institution he located in Saginaw, where he has resided ever since, in the pursuit of his profession. In 1889 he again visited Europe and took special courses in gynecology and surgery, and after his return to this country located on the East Side of the city, where he has since conducted his professional work. He is a member of the American Medical Association, the Michigan State Medical Society, and the Alumni Association of Rush Medical College. He is also a member of Gordon Granger Post, No. 38, G. A. R. He was married in 1877 to Miss Marie Louise Andre, daughter of the late Hon. Alexander Andre, of the well known real estate firm of Andre Bros., of Saginaw, and they have been blessed by the gift of two children. The Doctor has also been a member of the Board of Health, and Health Officer for a number of

years. He is a liberal contributor to medical journals, and has translated some valuable works from the French and German languages into the English vernacular. His specialties, in his practice at present, is diseases of women and surgery.

FORD, Corydon L., of Ann Arbor, Mich., was born at Lexington, N. Y., August 29, 1813. His early education was received at Canandaigua Academy, and his medical degree was conferred by the Geneva Medical College, in 1842, soon after which he settled in Medina, N. Y., to practice, from which he removed to Ann Arbor. From 1842 to 1848 he was Demonstrator of Anatomy in the Geneva Medical College, and from 1847 to 1851 he held the same position in the Medical College of Buffalo, N. Y. From 1849 to 1861 he was Professor of Anatomy in the Castleton Medical College, Vermont. From 1860 to 1867 he held the chair of Anatomy and Physiology in the Berkshire Medical College, and from 1864 to 1870 he held the same position in the Medical School of Maine. He has also lectured on this branch in the University of Michigan for many years, as well as in the Long Island College Hospital. He is a permanent member of the American Medical Association. He has prepared for medical classes systems of questions on anatomy, physiology, histology and other branches of medical science.

FORMANECK, Frederick, of Chicago, Ill., was born March 13, 1863, on a farm in Iowa county, Wis., of Bohemian parents, where he received his preparatory education in a little log

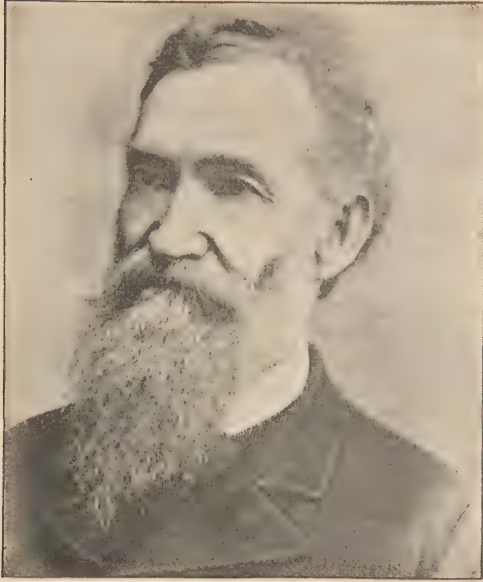

enough to attend school each following year. He worked at different lines each year; one summer took charge of a pleasure steamer on Green Lake, Wis., and another he traveled with the Engel Clock Company, and one vacation he worked in the First National Bank of Wahpaton, N. D., and another in a dry goods store, and last he worked as expert for the McCormick Harvester Company, traveling all over the States for two vacations. He began his study of medicine in 1880, with Drs. Nuckolls and Wiensma, of Wahpaton, N. D., as his preceptors, under the most unfavorable circumstances, and against the wishes of his parents, who had decided he should make theology his life study. He entered Rush Medical College in 1883, and graduated in 1886, with the highest honors, locating in Chicago, where, from the start, his success has been most marked. Dr. Formaneck has made surgery his specialty, and in this has had great success. In 1888 and 1889 he was, by appointment, made one of the surgical staff of Cook County Hospital, declining to serve longer on account of impaired health through overwork. The Doctor is a careful student and a thorough business man, well known and highly respected in a social as well as in a professional way. He is a member of the Masons, Knights of Pythias, National Union, as well as many other minor orders, where he serves as medical examiner and lodge physician. He is also medical examiner for several life insurance companies. Nature has blessed him with that firmness of manner so necessary for a physician to inspire in his patients a confidence in his ability to aid them, as well as a genial good humor, so essential to pave the way for the favorable reception of his advice. We can not predict too brilliant a future for one possessing such admirable traits of character.

FORSHEE, Thomas W., of Madison, Ind., was born in Warren county, O., November 12, 1825. He is a son of the late Dr. Edward M. Forshee, of Ohio, and is of French and Irish descent. His early education was confined to common schools. He entered Springfield Academy, Ohio, at the age of twenty. In 1847, when the Government called for troops to go to Mexico, he enlisted in the United States Mounted Riflemen; participated in all the battles around the City of Mexico; had the honor of being one of Gen. Scott's body guards in his triumphant entrance to the City of Mexico; was appointed hospital steward of his regiment, after the city was captured. At the close of the war he returned to Ohio; read medicine with Dr. Bray, of Springfield, his father's former partner. Graduated at the Cincinnati College of Medicine and Surgery, 1854. Located at West Caanan, O., where he built up a fine practice. At the breaking out of the War of the Rebellion he, like many of the old Mexican soldiers, offered his services, and was commissioned as captain and assigned to Co. K, First Ohio Volunteer Cavalry, and participated in the battle of Pittsburgh Landing and others, serving with distinction for one year; owing to failing health, had to resign. May, 1863, his health having improved, he was examined at Chicago by the United States Medical Board and commissioned first assistant surgeon of Eighty-eighth Illinois Volunteer Infantry, and performed the duties of a full surgeon for two years, and again was compelled by ill-health to resign. He then lo-

Fred Formaneck

country school, working on the farm part of the time. Subsequently he entered the Fond du Lac Commercial College and English Academy, where he spent the greater part of four years, working during this time so as to earn

Thomas W. Forshee.

cated at Kinmundy, Ill., where he practiced for fourteen years. Was appointed local railroad surgeon of the Illinois Central and served several years with entire satisfaction to the railroad authorities, and stood at the head of the profession in his county, having passed through several epidemics with wonderful success, especially that of pneumonia. In 1880 Dr. Forshee located in Madison, Ind. His ability as a physician and surgeon placed him in front as the leading surgeon of his county. Was a member of the United States Pension Board from 1882 to 1884, and is ex-president of the County Medical Association and a member of the American Medical Association, County Physician and Coroner of the county, and is doubtless the only surgeon who amputated the femur in upper third for traumatic embolism of femoral artery caused by gunshot wound of left breast; patient made a good recovery; case reported by State Medical Society in 1887, page 210, and by the suggestion of Dr. Hibberd was also published in *Indiana State Medical Journal* in order to give it a wider circulation. He is the author of a number of medical papers.

FOSTER, Eugene, of Augusta, Ga., was born in that city April 7, 1850. His father was the Hon. John Foster, of Georgia, one of the most popular and worthy citizens of the State. Having received an academic education, he began the study of medicine in the fall of 1868, and was graduated M. D. from the Medical College of Georgia (now the Medical Department of the State University), on the 1st of March, 1872. The remainder of that year was spent by him in attendance upon college clinics and hospitals, where he enjoyed extraordinary opportunities for advancement in a knowledge of his chosen profession. Returning from New York in the winter of 1872, he entered upon the practice of medicine in all of its branches, taking, at once, a high posi-

tion as a practitioner. He is doing one of the very largest, most lucrative and successful practices of medicine and surgery in the State of Georgia. In 1873 Dr. Foster was appointed physician in charge of the small-pox hospitals in Augusta, in which position he was charged with the duty of arresting the spread of that epidemic which so seriously threatened the city. In this he was eminently successful, stamping out the disease promptly. In 1874 he held a similar position with like success. During these years he was also physician in charge of the small-pox hospitals of Richmond county, and held the epidemic thoroughly under control. In 1876, when the city of Augusta was seriously threatened by yellow fever, he was appointed health officer, and as such was entrusted with the entire management of the quarantine and inspection services which were enforced there and on the railroad trains entering therein. In 1880 he was appointed a member of the Board of Health of Augusta, and unanimously chosen president of that body. He was unanimously re-elected in 1881 and 1884, 1888 and 1892. On the occasion of his second re-election to the presidency of the Board of Health, the members of that body, as a testimonial of their personal regard and their high appreciation of his eminent services to his native city, presented him with an elegant gold watch and chain and seal, on which were engraved the sentiments of the donors. Among the professional papers contributed by him are the following: "Carbolic Acid as Local Anesthetic in Surgical Operations;" "Treatment of Constitutional Syphilis;" "His-

Eugene Foster.

tory of Epidemics of Yellow Fever in Augusta, Georgia;" "The Most Effectual Means of Preventing and Controlling Small-pox;" "Sanitary Condition and Needs of Augusta;" "Examination of Alleged Dangers to Health from Excavations of Earth in Spring and

Summer Seasons;" "Sanitation—Its Importance and Economy;" "Prevention and Control of Small-pox by Vaccination, Isolation and Disinfection;" "The Relative Merits of Humanized and Bovine Vaccine Virus;" "Compulsory Vaccination—Laws of England, Ireland, Scotland, Germany and France, with Considerations as to the Probable Results of such a Law Applied to America;" "Municipal Organization of the American Public Health Service;" "Syphilitic Diseases of the Brain;" "Diagnosis and Treatment of Small-pox;" "Dengue Fever;" "Syphilis as a Sociological Problem;" "The Sewerage and Drainage of Augusta, Georgia;" "The Water Supply of Augusta, Georgia;" "Stricture of Urethra;" "Treatment of Phimosis by Dilatation;" "Rational Treatment of Diphtheria;" "Modern Antiseptic Midwifery;" "Alcoholic Liquors in Practice of Medicine;" "Enemata," and "Modern Wound Treatment," Dr. Foster is the writer of several of the leading chapters in Buck's Reference Hand-book of the Medical Sciences. For the last sixteen years he has been a member of the Medical Association of Georgia, manifesting a deep interest in its career of usefulness. He has served as chairman of the Committee on Inebriate Asylums, of the Committee on Prize Essays, of the Committee on Necrology, Committee on State Board of Health, and as a member of the Board of Censors, and in 1884 was chosen its president, showing his high standing in the estimation of the members of this distinguished body of physicians. Dr. Foster is a member of the American Public Health Association, and also of the American Medical Association, in both of which he holds positions on their most important committees, and has contributed to both interesting and valuable medical papers. Dr. Foster is the writer of the article on Vaccination, in Vol. IX, Transactions of American Public Health Association, 1883. The publication committee placed it among the leading papers of the volume, assigning as the reason "that its marked ability and somewhat exhaustive character give it a dignity much above that of a report." Dr. Foster is president of the Board of Health of Augusta; member of the Board of Trustees of the Lunatic Asylum of Georgia; vice-president for Georgia of the New York Medico-Legal Society; member of the American Academy of Political and Social Science; member of the Board of Censors of the Medical Association of the State of Georgia; president Richmond County Medical Association; member of the American Medical Association; member of the American Public Health Association; member of the Auxiliary Committee of the Pan-American Medical Congress. He is a member of St. James Methodist Episcopal Church South, and is a member of both official boards of that church. He is also a member of the Joint Board of Finance of the Methodist Conference of Georgia. It is manifest, from the positions he has held and still holds, that he enjoys the highest confidence and esteem of his professional brethren. Dr. Foster is now Professor of Theory and Practice of Medicine and Sanitary Science in the Medical Department of the University of Georgia. To his scientific attainments he has added the accomplishments of literary culture, while his genial nature renders him a favorite in the high social circle in which he moves. Still young and in vigorous health, there is

before him a prospective career of usefulness and distinction which may well be envied. Already his life has blessed mankind, and is an exemplar worthy of imitation.

FOWLER, Allen, of Salt Lake City, Utah, was born in Monroe county, Va., in 1840. He is a son of the late Dr. Thomas Fowler, who was one of the best-known physicians of his time in that portion of Virginia. His early ed-

Allen Fowler

ucation was received at Emory and Henry College, Virginia. On the outbreak of the Civil War, he left that institution and enlisted as a private soldier in McLaughlin's Battalion of Artillery of the Second Corps of the Army of Northern Virginia. He was promoted to First Lieutenant of Lowry's Battery, in which capacity he was commander thereafter of said battery during the greater portion of the war. He took part in all the battles fought by General Early, through the Valley of Virginia and Maryland, such as the battles of Winchester, Monocacy Junction, Fredericksburg, Harper's Ferry, and Fisher's Hill. He was severely wounded three times. In 1865, immediately at the close of the war, he entered upon his medical studies at the Medical Department of the University of Virginia, and subsequently, in 1867, he received his degree as M. D. from the University of Maryland. After graduation he practiced medicine at Virginia City, Mont., till the fall of 1868, when he located in Salt Lake City, Utah. On the founding of the Hospital of the Holy Cross of Salt Lake City, eighteen years ago, Dr. Fowler was appointed Medical Director. He is Division Surgeon to the Rio Grande Western Railroad, member of the Salt Lake County Medical Society, Salt Lake Academy of Medicine and President of the Territorial Board of Medical Examiners.

FRENCH, Pinckney, of St. Louis, Mo., son of Isaac C. French, was born in Audrian county, Mo., May 10, 1852. He comes originally of good old New England stock, whose virtues he illustrates in his own energetic and successful career. His early education was limited to the ordinary schools of the neighborhood in which he was brought up. Still, being a youth of sober, steady habits, of an inquiring mind, and with a marked taste for study, he succeeded in getting a good general English education. Deciding to devote himself to the medical profession as being the calling most in accord with his tastes and best adapted to the useful and successful exercise of his abilities, he entered upon a course of study under Doctors W. H. Lee and John S. Potts, both leading physicians of his native county. His career as a medical student was such as to raise high anticipations in the minds of his friends as to his future in medicine. Following his course of reading, he matriculated at Miami Medical College, of Cincinnati, O., from which institution he graduated in 1873. His course of college training was characterized by close application to his studies and by that clear and practical comprehension of the principles involved in the branches of surgery which have marked his subsequent career. The Doctor immediately located in his native town, Mexico, Mo., where his high attainments and superior abilities as a physician soon became recognized, and he rapidly built up a large practice which he continued to hold with increasing success and reputation. He was married in 1874 to Miss Lucy Guisenberry, of Boone county, Mo., a lady of varied accomplishments, of unusual brilliancy of intellect and conversational powers. In a few years he was appointed surgeon of the Chicago and Alton Railroad and surgeon of the Wabash Railroad, the former of which positions he continued to hold until July, 1891, when he resigned to give more attention to other duties. In 1879 he was elected president of the Medical Society of Audrian county. The following years he was honored by the Board of Curators of the Missouri State University with the appointment to a membership of the Board of Medical Examiners of that institution, which position he held for several years. The Doctor was elected first vice-president of the Missouri State Medical Association in 1882, and was Professor of Surgical Anatomy in the College of Physicians and Surgeons, of Chicago, Ill., during the years of 1882 and 1883, resigning to resume his general practice. He was during this time associate editor of the surgical department of the *Western Medical and Surgical Reporter*, of Chicago. In 1885 he visited Europe, thus gratifying a cherished ambition, for the purpose of thoroughly acquainting himself with the rapid progress of modern sciences, more especially those pertaining to medicine. He visited hospitals of renown, observed and studied closely the branches of surgery, and gained much useful information and knowledge. There he was closely associated with some of the most eminent physicians and surgeons that the world had ever produced. He has made a collection of their portraits and has secured interesting sketches of their lives, and visiting his office it would be both pleasant and interesting to note the collection thus obtained and so highly prized. Returning to

this country, he found that the strides of progress had made St. Louis a city of great desirability as a place of residence, and Dr. French, like many other men of progressive and liberal ideas, left his native town and removed to that city, and thus united his energies and consultation with those of the medical men already there, in the work of making it one of the great medical centers of the world. He became at once connected with the College of Physicians and Surgeons, which chair he held until 1890. Having acquired a good practice among the best families of the city, in 1890 he moved his family and took up his residence in St. Louis, and after studying the architectural designs of a number of places, planned out and erected one of the handsomest residences of Delmar avenue, so popularly known for its beautiful dwellings. About this time Dr. French became interested in the organization of the Marion-Sims College of Medicine, and was elected secretary of its first board of directors and also its first faculty. He was elected Professor to the Chair of the Principles and Practice of Surgery and Clinical Surgery, and continued to hold the same until the spring of 1892. His experience in this department of his profession gives evidence of his being an interesting and popular teacher, plain, practical, ready of language, clear in expression and discrimination in the enforcement of his conclusions. At all times he has been in sympathy with his students, and has ever looked to their interest and advancement in their studies, and has gained the admiration, respect and esteem of every student who has had the good fortune to come under his well-directed instructions. "He has recently conceived the noble idea of rearing in his adopted city an institution of medical learning built upon a true foundation of proper management and established upon a policy of instruction which would be recognized the world over. As a result of this, the Barnes Medical College has had its birth, and with the aid of Drs. Hughes and Carpenter, a board of directors was formed of wealthy and influential citizens, and, as a well-earned reward, Dr. French was made secretary, virtually placing within his hands the management of an institution which has had its origin in prosperity, and, with a phenomenal beginning, will soon grow with unparalleled success, until it stands in the foreground of the profession, the representative medical institution of the West. He has labored with unusual efforts to procure a large class of students, and, through his peculiar personal magnetism, a large number of representative young men have been drawn from this and other States. The subject of this sketch is now in full vigor and strength of manhood, with all his faculties unimpaired. He is a man of great sagacity, quickness, sound judgment, noble impulses and remarkable force and determination of character. Honorable in every relation of life, and of unblemished reputation, he commands the respect and confidence of all who know him. As a physician and surgeon, he is held in the highest esteem by his fellow-men. As he has devoted his life to a noble profession, so he is now crowned with its choicest rewards. In all professions, but more especially the medical, there are exalted heights to which genius itself dares scarcely soar, and which can only

be gained after long years of patient, arduous and unremitting toil, inflexible and unfaltering courage; in this proud eminence, we may safely say, Dr. Pinckney French has risen, and in this statement we feel confident we will be sustained by the universal opinion of his professional brethren, the best standard of judgment in such cases." Among the associations of which he is a member may be mentioned, the Surgical Association of the Wabash Railroad, of which he is now president; the Missouri State Medical Association; the American Medical Association; the Mississippi Valley Medical Association; and the St. Louis Medical Society. He is also consulting surgeon to the St. Louis City Hospital. He enjoys a large surgical practice, his professional labor including some of the most difficult work known to surgery, and in which he has been unusually successful. As a surgeon, he is skillful in diagnosis, cautious and conservative in operative procedures and in all professional work; and for coolness and sound judgment in his undertakings, he is one of the most widely-known young surgeons in America. Among his work are included many laparotomies and craniotomies and 177 amputations. While not a voluminous writer, he has prepared several articles of decided merit. Among which are the following: "Aneurism of Femoral Artery, Ligation;" "Surgical Treatment of Dysmenorrhea;" "Spontaneous Fractures;" "Surgical Errors;" "Modern Treatment of Tuberculous Joints;" "Cephalotomia, Operation by Forceful Extraction;" "Cephalotomia, its Treatment by Aspiration;" "Amputation, a Review of its History, with Report of One Hundred Cases;" and "Innominate Aneurism," with a review of the cases now on record.

FRICK, Charles, of Baltimore, Md., was born August 8, 1823, and died March 25, 1860. His father, the Hon. William Frick, was a distinguished member of the Maryland bar, and after filling several posts of prominence was elected Judge of the Superior Court of Baltimore City, a position which he held at the time of his death in 1855. The following extracts concerning the brief but brilliant career of the subject of this sketch are derived from an extended memoir by Prof. F. Donaldson in the American Medical Biography. His early life was characterized by remarkable sweetness of temper, by a careful observance of the rights of his companions, by unusual quickness in the acquisition of knowledge, and by a spirit of self-abnegation and a forbearance towards the weak and unfortunate, which secured him the esteem and admiration of all who knew him. His classical and mathematical education was completed at Baltimore College under President Prentiss, who was heard to say, a few years before his death, that he had been the cleverest boy he had ever had under his charge. After leaving college he selected the profession of engineering, and was employed for a while as an assistant on the Baltimore and Ohio Railroad. In the spring of 1843 he began the study of medicine with his friend Dr. Thomas H. Buckler, and in the ensuing autumn attended a partial course of lectures in the University of Maryland. At the close of the session he was admitted as a resident pupil into the hospital attached to the Baltimore City and County Almshouse, averaging about six hundred inmates, with two hundred beds for the sick, and a lying-in de-

partment. Dr. Frick took the deepest interest in his cases, discussing with his young colleagues, their diagnosis and treatment, and never failing to examine the bodies of those who died. He was the first to keep a daily record of the diseases as they were admitted, finding that it gave accuracy to his reports, while it improved his methodical habits, which were afterwards of great service to him. Professor William Power, a brother-in-law of Dr. Frick, having several years previously returned from Paris, where he had been a favorite pupil of the great Louis, was the first to introduce a knowledge of auscultation into the practice in Baltimore. To this department, in the first instance, Mr. Frick's attention was attracted, and to acquire a familiar knowledge of it, he applied the zeal and energy always characteristic of him. The accuracy and beauty of this science warmed him into enthusiasm, and at hours when the other students thought they could sit and smoke together, he was often discovered wandering about from bed to bed, with stethoscope in hand, marking out the limits of the diseases of the heart and lungs. In this way, not unfrequently, he would ferret out in the old chronic wards some rasping murmur, or perhaps some heretofore unsuspected aneurism. To him the house was never destitute of interest, even when others complained of the dullness of the wards; for his time and his thoughts were always employed in investigating disease. His talk was of medical cases, and his accurate ear, and still more, his great attention, together with his power of discrimination and analysis, soon made him a fine auscultator. Yet he never hastily formed his opinions merely from physical signs, but gave them their due correlative value when associated with the subjective symptoms; for he recognized the true principle that, by themselves, they were indications of physical conditions, and not of pathological lesions. The dead-house was to him a source of great interest, for his favorite authors were Louis, Andral, and Chomel, of the pathological school, all of whom taught him that descriptions of disease were valueless, unless the daily details of their progress were carefully recorded, together with the post-mortem lesions, not merely of those organs that appeared to bear upon a particular point of their history, but of all of them as minutely as the modes of examination then accessible permitted. When others would weary of the unpleasant work Mr. Frick would remain and try "to search for truth even to the center," at the expense of any amount of time and trouble. When he left the almshouse at the end of his year, he carried with him, besides a number of anatomical preparations, a large number of cases of a great variety of disease, hoarded up in the storehouse of his memory for future use. In March, 1845, he took the degree of Doctor of Medicine, in the same university where, twelve years subsequently, he was elected to the professorship. His inaugural thesis was written on Puerperal Fever, and contained numerous cases which he had himself carefully observed. In this he manfully maintained its contagious character, and ably criticised Nunnelly's view of its identity with erysipelas. Dr. Frick's first article appeared in the April number of the *American Journal of the Medical Sciences*, 1846. It consisted of reports of cases

of remittent fever made by Dr. Washington F. Anderson and himself, together with remarks by Dr. Alfred Stillé, of Philadelphia. Its value may be judged of from the fact that it has been extensively quoted in Bartlett's book on Fevers, and, indeed, in all systematic treatises in which remittent fever is included, as an important contribution to our knowledge of its pathology. Louis' valuable treatise on "Typhoid Fever" had made its appearance in 1836, establishing the characteristic lesions of that disease, which had the effect of attracting attention to other fevers, and Dr. Stewardson published, in 1841, his paper on the lesions of "Remittent Fever," for the first time showing that the anatomical characteristics of the disease was the condition of the liver, which was enlarged with its consistence diminished, especially of the right lobe, and its color changed to that of a slate or bronze, the surface of a section being polished. Dr. Stewardson's cases were only nine in number, and Frick and Anderson's were eleven, with one of pneumonia, in a patient who had had remittent fever, from the pathological lesions of which he had not recovered. The great value of these observations consisted in their confirming those of Dr. Stewardson, and establishing the fact of the uniformity of the softening of tissue of various organs, but especially of the liver, spleen, and heart. Thus we have had a point of pathology fixed, and material aid afforded to a clear classification of essential, idiopathic fevers. Soon after graduating, Dr. Frick opened an office in the spring of 1845, with his friend, Dr. Stedman R. Tilghman, whose talents for surgery gave great promise of usefulness and distinction. As is usually the case in large cities, these young practitioners made but little progress in the first two years, and Dr. Tilghman, having received an offer of the position of surgeon in one of the volunteer corps in the Mexican War, gladly accepted it. The climate of Mexico and the hardships of the campaign overcame his once vigorous constitution, and he died the following summer. Dr. Frick patiently struggled on, and organized, with three of his friends, in the fall of 1847, the Maryland Medical Institute, a preparatory school of medicine, he taking the department of practical medicine. This gave him occupation of a pleasant kind, and developed a talent for teaching, which, a few years later, made him a very acceptable professor. M. Andral's little book on the blood, containing, as it did, his important researches as to its organic constituents, had given Dr. Frick, when but a student, a taste for animal chemistry, which soon ripened into a fondness for it. Moreover, with the fund of knowledge he had accumulated by his hard study and his year's experience in a large hospital, he yet felt the necessity for still further aids to diagnosis, and had a strong desire to dive deeper into the human currents. He therefore cultivated his knowledge of chemistry, in which, in fact, he had almost entirely educated himself, for he received but little assistance from others. In January, 1848, he published in the *American Journal of the Medical Sciences* the results of his analyses of the blood, which, as he stated, he had undertaken with no view of supporting any particular theory in regard to the chemical changes the blood undergoes in disease, but to determine its healthy composition as a standard formula,

in order to be able to note any alterations which disease might effect, and thus prove of assistance in diagnosis or treatment. Although Andral had already done a great deal in ascertaining the changes disease produces in the organic elements, yet it seemed to him that there was an ample field in the study of the inorganic changes. This article of Dr. Frick gave him a place among the most distinguished medical writers of his time, and in modern works on animal chemistry, these investigations are quoted side by side with those of Lehman, Becquerel, Rodier, and Simon. In Ancell's treatise on "Tuberculosis," Dr. Frick's analyses of the organic and inorganic ingredients of the blood in that disease are given with minuteness and in detail. The care and labor which he bestowed upon these analyses were very great. He systematically tabulated every ingredient, with all the concomitant or modifying circumstances, in one hundred and fifty cases, including many of the principal diseases such as tubercular phthisis, idiopathic fevers, rheumatism and anæmia. As evidence of his patient spirit in his investigations of scientific facts, and his perfect fairness in his deductions, it ought to be stated that in his conclusions he rejected no less than seventy of these troublesome analyses, because there was some little point in the diagnosis or in the process which he considered as uncertain. In October, 1849, Dr. Frick was elected Attending Physician to the Maryland Penitentiary, a position which he filled for seven years. His yearly reports to the trustees all contain data collected from observations of the effect of the confinement upon the inmates, which are of interest and value. He took the pains, after examining the convicts when admitted, to weigh them systematically every six months for years, carefully tabulating the results, in order to ascertain what they lost or gained in weight under the influence of their imprisonment, comparing the different occupations and diet upon both the whites and blacks. He made the hygiene of the institution his especial study, and his practical suggestions were found to promote in many ways both the comfort and health of the inmates. As evidence of this, we find that of three hundred and eighty admissions, in the course of three years, only one case of tubercular phthisis had its origin within the prison. Before Dr. Frick left the almshouse, urinary pathology had become a favorite study with him, and he was pronounced a few years afterwards, by Prof. John A. Swett, of New York, who had himself paid much attention to this class of diseases, as the most reliable authority in regard to them in the United States. As the fruits of his labor in this field, previously so little explored, he published, in 1850, his volume on "Renal Diseases." He stated in his preface that his motive was to simplify the study of urinary pathology, and to make it attractive to others. This he admirably succeeded in, together with giving to the medical public many valuable hints and some important truths. One great beauty of Dr. Frick's mind was that it was so well balanced, that, with all his enthusiasm, he never had hobbies—he did not over estimate the importance of any one set of symptoms. As proof of this, we call attention to the introduction to this volume, where he was decidedly in advance of others who had written on the same subject, when he urged

his readers not to place too much confidence on the mere examination of the urine, either chemically or microscopically; claiming for it the same relative position that auscultation occupied in thoracic diseases; their signification to be interpreted by the other symptoms. In July, 1852, in the *American Journal of Medical Sciences*, will be found a report from Dr. Frick of some cases of diabetes mellitus, giving in minute detail the symptoms as they presented themselves, with carefully drawn-up tables, showing the influence of the various treatments upon the course of disease, as well as that of the different diets, animal, farinaceous and vegetable. This paper is valuable as confirmatory, by close clinical observation, of M. Bernard's view of the formation of sugar in the liver. So minutely and carefully is everything having any bearing, either upon the nature of the disease, its hygienic or therapeutical treatment, recorded in these cases, that it was spoken of to the writer of these pages by one of the most eminent medical authors of this country, as a model paper. In October, 1853, Dr. Frick married Achsah Sargent, the eldest daughter of the Rev. Thomas B. Sargent, D. D., of Baltimore, a distinguished Methodist clergyman. In June, 1854, he read before the Medical and Chirurgical Faculty of Maryland, at their annual meeting, a paper on the diuretic properties of different drugs, as shown by his experiments in no less than two thousand separate observations on the inmates of the prison. These were the average results obtained from the examination of a large number of cases taking the same remedy. Every precaution was taken by him to have the results accurate, by making allowance for the condition, age, and other controlling circumstances in each case. Notwithstanding Becquerel and Bird's published works show that the quantity of fluid passed is no test of itself of the increased or diminished function of the kidneys; but that the quantity of the solid materials is the real test, yet the division of diuretics into two classes, the hydragogue and depurative, is generally completely ignored. In his paper Dr. Frick draws particular attention to this distinction, insisting upon its importance, demonstrating that very frequently the extra amount of urine passed is owing to the perspiratory functions being less active, or to the amount of water imbibed greater; whereas the number of grains of solid material represents the elements of the worn-out tissues and those substances which, although absorbed by the blood, subserve none of the purposes of nutrition, and therefore seek an outlet by the kidneys. In these experiments, Dr. Frick arrived at some novel results. The sulphate of quinine, three grains, with sulphate of iron, one grain, was the most powerful diuretic, producing fifty-seven fluid ounces, containing 1248 grains of solid material, 700 being the natural average, Next in value was juniper tea, causing discharge of fifty-six fluid ounces, with 1134 grains. Below these two came in order the prussiate of iron, sulphate of iron, and acetate of potash. Sweet spirits of nitre, generally considered so valuable as a diuretic, did not increase in the least the fluid, and the solids to a very slight extent, in fact only 782 grains. Morphia and strychnia decreased both the fluid and the solids. In connection with urinary pathology, Dr. Frick tried to clear up the

indefinite ideas generally prevalent, in regard to Bright's disease. In a paper read before the Baltimore Pathological Society, in 1855, and published among its transactions in the *Virginia Medical Journal*, and still later, in two clinical lectures published in the *American Medical Monthly*, of New York, he substantiates the general belief that the mere presence of albumen does not show, as the distinguished discoverer of the disease taught, that there is any Bright's disease; but that it may be owing to simple congestion, or to pressure, as in pregnancy. Dr. Frick believed, with Jones and Sieveking, that a diseased state of the blood is the essential cause of renal degeneration, and that this consists in an abnormal state of the natural constituents, probably of the albumen, or fibrine, which induces an unhealthy nutrition of the renal tissues. He made a broad distinction between the enlarged kidney from degenerative disease, and the contracted, granular kidney, resembling cirrhosis. Dr. Frick taught that the presence of fibrinous casts of the tubes containing spherical epithelium, and sometimes blood corpuscles, indicate congestion or inflammation of the tubuli, and nothing else; but if these epithelial cells are enlarged, and their walls thickened, making them unusually opaque, if they are in sufficient quantity to block up the channel of the tubes, and, moreover, contain a certain quantity of oil-globules, we can have no doubt as to the nature of the disease. Equally important is it, when the casts are almost solid, containing more or less oil but no epithelium, showing that the epithelial cells have been already thrown off, and the nutrition of the part is incapable of forming them anew. During these years that he was doing so much for the science, his reputation at home was gradually increasing his business as a practitioner, but not in proportion to his acknowledged merits. He was occasionally discouraged, but he knew if he persevered his success was inevitable; so, with a bold but patient spirit, he did persevere, all the time endeavoring to prepare himself the better to attend to the cure of disease, in all and any shape it might present itself. He had many resources with which to fill up his spare time profitably and pleasantly. Belonging to a family remarkable for their cultivated intelligence, he had early in life acquired a fondness for general literature, with an appreciative taste for the fine arts. The study of the natural sciences was very attractive to him, and he would have enjoyed spending much of his time upon them. Moreover, his social position gave him access to the most refined and educated of the community, and his cordial manners made him a welcome visitor. Although his profession was the first object with him, yet he thought it his duty to cultivate himself as a member of society. He followed the advice he gave to the graduating class, when he said: "You should bear in mind always that you are members of an intelligent and civilized society, and that, as such, you are bound to use all your abilities to multiply and diffuse the heaven-born blessings, which tend to adorn and dignify the social relations of man, and that constitute the greatest source of human happiness. Remember that the tendency of every pursuit is to give a certain narrowness to each individual's mind, whereby he accords too great importance to his own occupation, and underrates

all others. In your leisure moments, therefore, endeavor in a knowledge of the useful and elegant arts, and in the charms of polite literature, to enlarge those acquirements, which are common to all educated men." During the years 1855 and 1856, Dr. Frick took a prominent part in the Baltimore Pathological Society. The proceedings of this society, as found in Dr. Van Bibber's reports in the *Virginia Medical Journal*, contain some valuable papers from his pen. In this association, consisting, besides men of his own date and age, of some of the older members of the profession in the city, he was looked up to and listened to with marked attention. In the discussions, especially on urinary pathology, he was eagerly appealed to as authority. On the establishment, in 1856, of the Maryland College of Pharmacy, Dr. Frick was selected to fill the chair of Materia Medica. His accurate knowledge of his subject, and his peculiarly apt and impressive mode of imparting his information, soon established his reputation as a lecturer. For two years he taught with signal success. He had no small share in starting on a sure basis this college, organized to promote the standard of education among apothecaries. In the summer of 1856, he made a tour of a few months in Europe, visiting, with interest and profit, the hospitals in Paris and in London. He could not but have been gratified at his cordial reception, by the great pathologists, Paget, Todd, Bence Jones, and Trousseau, particularly when he found that it was in consequence of their familiarity with his scientific papers, and their high appreciation of them. He speaks glowingly in his journal of his enjoyment of the good and the beautiful in art and in nature, which he met with in his travels; but that which particularly attracted his attention, and had most beauty in his eyes, was anything connected with his favorite study. In August he says: "I have never seen anything so beautiful as the Alpine Flora; on every side, quantities of aconite with its tall spike of blue hoods, the delicate little campanella with its bell-shaped cup, and the 'modest blue gentian' skirting the glaciers. And throughout Switzerland, I met with quantities of colchicum." Everywhere he kept in view his lectureship, as was shown from his bringing home with him a number of rare specimens of materia medica he had collected as he went along. On returning from Europe Dr. Frick recommenced his private practice with his accustomed energy and activity. Already his name had been mentioned in other schools of medicine, and he had been written to about them; but he would not consent, even to be offered a professorship elsewhere, for he considered himself as permanently moored in Baltimore; and we question whether the most lucrative chair in the country could have enticed him away. His friendships and social connections were very strong, and he did not think a man could be a good teacher of medicine unless he was an active practitioner, daily meeting with the trials as well as successes necessarily attendant upon such a life. Dr. Frick thought that it would be indelicate in him to apply for a place in the school of medicine of his own city, particularly when the faculty, composed as it was entirely of medical men, had the selection. His high-toned sense shrank from such obtrusiveness. But this was unnecessary,

for, as another friend of his has expressed it, "in 1858 a vacancy occurred in the faculty of the University of Maryland, whereupon all eyes were turned towards Dr. Frick, as the man above all others in the medical profession of our city, whose entire fitness for the chair was pre-eminent and undeniable; and when the faculty, in verification of the universally expressed opinion, elevated him to the professorship of Materia Medica and Therapeutics, most hearty congratulations were offered, as well to the new professor as to his colleagues; and the most confident predictions were uttered as to his success as a teacher, and the considerable part he was likely to take in extending the usefulness and reputation of the institution." Immediately on being appointed to the professorship, he took charge of the medical department of the Baltimore Infirmary, as visiting physician. This was, perhaps, to him, the most attractive part of his new field, because, to render his general course of lectures complete, he would be obliged to include much of traditional teaching in regard to the action of remedies, about which he was by no means satisfied; although he endeavored, as far as possible, to guard against the excessive use of drugs, and a too great reliance upon them, without attending to the hygienic management, such as the regimen and the nursing, upon which he laid much stress. At the hospital, with cases of intricate disease to investigate, he was perfectly at home; and he had an opportunity of practically testing the value of the remedies of which he spoke at the university. His great familiarity with all the modern modes of searching into morbid phenomena, his being an expert auscultator, a fine analytical chemist, and his dexterity in the use of the microscope, and, above all, his patient, unwearying industry, made him a remarkably accurate diagnostician. This, of itself, fixed the attention and excited the admiration of a large class of students, who followed his daily visits. He was willing and anxious to impart his knowledge, and spared no pains to render all clear to them. His uniform kindness attached them to his person, and his perfect frankness in regard to his opinions, confessing, as he always did, when he was in doubt, or when he had made an erroneous diagnosis, gave them great confidence in his judgment. As a lecturer he was equally fortunate. He was listened to with marked attention, and even when speaking of dry details of the drugs themselves, he made his subject one of interest to them. In regard to the medical controversies of his day, Dr. Frick did not hesitate to express his opinions as he had matured them. Of that in relation to blood-letting, he did not disbelieve that it was sometimes useful in pneumonia and other inflammatory diseases, but he taught that it was inadmissible in any other than the forming stage of the disease, and even then only with a view of relieving the pressing dyspnoea, when it was to be resorted to with great caution, on account of its depriving the blood of its red globules, essential to its nutritive functions. In the important change visible everywhere in the treatment of inflammations, he did not deny the theory of Watson and others, that there had been a change of type of disease, but, to use his own words, "one great cause of the change in regard to active treatment, including venesection, is the better ob-

servation of diseases, their progress, and the results of remedies upon them." In 1858, Dr. Frick made a report to the Pathological Society, containing his interesting investigations in regard to vaccination and revaccination. The whole number of revaccinations observed by him was six hundred and twelve. Vaccinia being acknowledged now as a variola reduced to its minimum, it is curious that, whereas in the latter the percentage of persons taking it twice is only five per cent., in the former Dr. Frick found the percentage of successful revaccinations in private practice was thirty-one per cent., and in the prison twenty-one per cent. He found that the susceptibility of individuals to vaccination was not modified by age; and, what was still more curious, that the percentage of successful revaccinations was not greater as the years increased. So he concluded, not only that there was no particular age at which individuals are most liable to successful revaccination, but that the protection vaccine virus affords, contrary to the received impression, does not diminish by time, but is modified by the peculiarities of the individual's constitution, which can only be ascertained by experiment. Referring to the origin of urea, the most important ingredient, in a physiological point of view, of the whole urinary secretion, Dr. Frick was led by his own investigations to differ from Liebig and Bischoff, who maintained that it was derived entirely from the metamorphosis of the nitrogenous tissues, and to agree with Lehman and Schmidt, in admitting this source, but asserting that, in addition, the quantity is increased by the ingesta of nitrogenous food. The immediate formation of urea he believed, with Liebig and Dr. William A. Hammond, to be from the oxidation of uric acid, which he considered a substance one degree higher in the scale of descending metamorphosis of matter. Dr. Frick acknowledges that uric acid is a normal constituent of the blood, and that in acute and chronic gout there is always an abnormal quantity present, whereas, in rheumatism, the reverse is the case, the excess being in the urine, and the deficiency in the blood. To do Dr. Frick's views justice on this important point, we feel we ought to quote his own clear and expressive words: "But it is important to know that a deposit of this acid or its salts does not always occur because there is an excess. Indeed, such is never the case from excess alone. To be excreted from the blood at all, it must be in solution, and as it is then removed from the laws of vitality, and free to be influenced by chemical reaction alone, the cause of deposition whilst in the urinary passages must be looked for either in the composition of the urine itself, or in the condition of the membrane over which it passes. The forms in which this substance is found to exist as a deposit are urate of soda, urate of ammonia, and, now more rarely, urate of lime. Now, ammonia, as is well known, is not a constituent of healthy urine, but results from decomposition of the urea, either before or after emission. The existence, therefore, of urate of ammonia implies that decomposition has taken place after secretion. This decomposition is more likely to occur in the bladder than elsewhere; and hence, calculi of urate of ammonia should be most commonly found in this viscus. Such is really the case. Urate of soda, on the other

hand, is the normal condition in which uric acid exists in solution; and if ammonia alone be produced by decomposition, the urate will be found in this form. Again, if, from decomposition, a stronger acid than the uric be developed, this acid will unite with the soda, the result will be a deposit of uric acid alone. It is exceedingly rare for urine, on its emission, to contain free uric acid or urates as a deposit. It is apparently so, for these changes are produced in a short time from the metamorphosis of the pigment into lactic acid, and sometimes also, acetic acid, by the influence of the mucus of the urinary passages." This he imputes to what Sherer had called "acid urinary fermentation." The ferment can easily be removed by boiling fresh urine, by adding alcohol to it, or, still better, by filtering it. This fermentation can take place either out of the bladder or before it is voided. For this reason Dr. Frick could no longer recognize a uric acid diathesis, inasmuch as the increased amount is simply due to a departure from ordinary physiological laws; and the deposit, to changes taking place in effete organic matter. In the same way, phosphoric acid, being a normal constituent of urine, is derived from the blood, and the amount is increased only in one class of diseases, and that is inflammation of the brain itself, it being a phosphorized tissue. Thus there is no ground for the phosphatic diathesis theory. Dr. Frick calls attention here to the fact how exceedingly common it is to find the phosphates in the urine of persons who, from paralysis or other causes, have lost the ability to empty their bladder, or who have chronic inflammation of this organ. In this latter case, an undue amount of altered mucus is secreted, which, acting as a ferment upon the urea, produces as a result, ammonia, by which the acid reaction of the urine is removed, and the phosphates at the same time deposited. We must, therefore, look for the causes of phosphatic calculi almost entirely in the bladder itself, renal calculi being nearly exclusively of oxalate of lime and uric acid. In regard to oxalate of lime, Lehmann had shown it to be an ingredient of healthy urine, by exposing it out of doors to a temperature just below 32° Fahr., by which means the water alone freezes; the urine concentrates slowly, and the crystals are found in the deposit, in the form of octahedra. These chief constituents of calculi, uric acid, the phosphates and oxalate of lime, being healthy constituents of the urine, a deposit of any one of them by no means proves it is in excess. It may even be coincident with a diminution, and therefore it is fair to conclude, with Dr. Frick, that these diatheses, as they were called, do not really exist. Having established this point, he shows that calculi are most common in England, Holland, and in the northwestern part of France, where there is a great humidity of the air. This unusual amount of vapor in the atmosphere has the indirect effect, as is familiarly known as to the bronchi, of irritating the mucous passages generally, and of those of the urinary organs in particular, by interfering with the normal action of the skin, and thus giving the kidneys extra duty, and altering the mucous epithelium either in quantity or quality. Moreover, analyses have shown other facts having an important bearing upon this point. For we now know that these calculi contain much animal matter, sometimes

as nuclei, in the shape of clots of blood, mucus or epithelium; and calculi are frequently met with where there has been stricture of the urethra, disease of the prostate, and organic disease of the kidneys, ureter, and bladder. Then again, it has been long observed that foreign substances in the bladder act almost invariably the part of nuclei of calculi. These facts all appear to render Dr. Frick's views correct, in attributing to morbid secretions, whether blood, albumen, or epithelial, resulting from chronic or acute irritation of the bladder, the credit of the formation of calculi, and not, as has been heretofore supposed, to the composition of the urine. Such being the case, in order to prevent their formation or re-formation, he advises that the remedies be addressed to the urinary passages themselves, and not to their secretions. See essay on the "Formation of Urinary Calculi," 1858. This article shows how unwilling he was to grope on in the dark, taking for granted what other men had written. He thus searches after truth and throws valuable light upon important points in pathology. Dr. Frick's last publication was one made by his class, being his lecture on diuretics. It is a clear exposition of his views on the action of a class of remedies which he had thoroughly studied. It is scientific, yet very practical. We have thus traced, step by step, Dr. Frick's career, short in duration, but valuable in its results to science. Our motive has been to do justice to his talents and his labors; and to leave on record for those who follow him his bright example, demonstrating how much can be accomplished by persevering industry, and unwavering adherence to high principle and truth. For a due appreciation of the force of Dr. Frick's character, it ought to be known that, from the moment of his commencing his medical studies, to the time of his receiving the appointment at the university, he was struggling under the depressing influence of pecuniary embarrassment. His proud spirit was almost broken from feeling so acutely the sting of temporary obligation from even his own brothers; yet he never flagged in the study and investigation of the truth. Nor could offers, which we know were made to him to go into business of a very lucrative kind, tempt him to abandon the profession of his choice and of his affections. Before concluding this narrative with the last sad and painful scenes of his life, we must be allowed to speak of the high estimate in which he was held in his native city by his professional brethren. He was considered, not only as occupying an eminent position in science, but as destined to be a prominent practitioner; for, with all his high scientific attainments he was exceedingly practical, and his investigations had a direct bearing upon practical medicine. He was looked up to with reverence by the men of his own date; and, over the younger men, he had unbounded influence. His elders in medicine had already learned his value, and were availing themselves of his knowledge in consultations. He was acknowledged to be the very man for the times, in which a great revolutionary movement was going on in medical doctrines, when some were disposed, in the reaction from polypharmacy to go to the other extreme, and become skeptical of the value of therapeutical agents. He was not credulous, but he did not permit his incredulity to shake

his belief in all medication. He was not willing to be led by tradition in medical science, but he was ready to trust the statements of others, when they were based upon reliable experiments. He had, it is true, very little confidence in the mere dicta of men, however eminent, because no one knew better than he did upon how loose and unscientific foundations the reputation of drugs had often commenced. He was conservative in the true sense of the word. He was for preserving the truly valuable of the old in medicine, and only in favor of the new, when it was the growth of healthful progress. With all his enthusiasm, he was deliberate in the formation of his opinions, and never intolerant of those who differed from him. As a practitioner, he was highly esteemed, for he was sympathizing, kind, and attentive. He was thorough in his examinations, and careful and watchful in his treatment. Dr. Frick had been connected with the university for two years with entire satisfaction to all parties, and as he advanced in reputation and in practice, he devoted himself with increased energy to the acquisition of knowledge. He seemed about to reap the fruit of all his labor, and to have his patience rewarded by a success in life, of which he might have been proud. He was attending to the active duties of his noble avocation, cheered by his present prosperous state and buoyant with bright hopes of the future. He was the pride of his friends and the ornament of his profession. On Tuesday, March 20, 1860, he performed, at the infirmary, the operation of tracheotomy upon a negro woman who was sinking from epidemic diphtheria. From early childhood he had shown peculiar susceptibility to idiopathic poisons. He never attended a case of scarlet fever that he did not suffer with his throat. So in this instance, in attempting to save the life of this poor creature, he, apparently at least, inhaled the poison, and the next day he complained of some soreness about his throat, notwithstanding which, in the afternoon, he went to the funeral of a friend, and stood in the graveyard on the damp ground with his head uncovered, when there was blowing a chilling March wind. That night he had a severe chill, with increased swelling and pain about the throat, and the next morning—Thursday—when his uncle and friend, Dr. John Buckler, was called to him, already the foul disease had taken a firm hold upon him, and the membrane characteristic of diphtheria was forming. From this time his sufferings became very acute, and the disease advanced in malignancy, notwithstanding both Dr. Buckler and Prof. George W. Miltenberger brought to bear all the resources of the art, with the skill for which they are so distinguished. The agony in deglutition was so great that it was almost impossible for him to accomplish it. Friday and Saturday were days of intense suffering. He went from chair to chair, from bed to lounge, wandering about the room, trying every position that might bring breath, and with it ease. His frame was worn out for since Tuesday night he had no sleep and could get none. Saturday evening the dark shadow of the result was unmistakable, from his cold, cyanosed cutaneous surface and his depressed pulse. His physicians decided that tracheotomy could not benefit him, for he was sinking, not from mechanical trouble in his larynx, but from the depressing

influence of the poison itself upon his whole system. He was aware of this, yet he himself urged it, saying that it would afford him some temporary relief. They reluctantly consented, and the operation was performed, and after it, all were rejoiced they had yielded to his entreaties, for it enabled him to take a refreshing sleep. But this with all else that was done for him, was of no real avail. Those who were with him that last night of suffering can never forget it. But still more indelibly is there impressed upon their memories the calm, manly courage with which he met the approach of death, of which he was perfectly aware. His beautiful submission to God's will and his fortitude were worthy of the Christian. "Never," said Dr. Buckler, "never shall I forget the manner in which he arose from his bed, seated himself in the chair, directed how the light should be placed so as to cast no shadow on the hand of the operator, handed the bistoury, and placing his finger on the spot, threw back his head with a courage perfectly heroic." He died with his devoted wife by his side, surrounded by mother, sister, and brothers, and in the arms of a friend whom he had summoned that night to his dying bed, and who loved him as a brother. His death in his thirty-seventh year, although deeply regretted, was not untimely, for he had completed the work his Father had given him to do, and had done it well. He has left his mark, his impress upon his generation. Young as he was in years, he was eminent in science, skillful in his art, high in the esteem of all who knew him, and his memory is cherished in the hearts of the many who loved him.

FULLER, Henry Joseph, of New Bridge, Oregon, was born in Vergennes, Addison county, Vt., June 3, 1853. He is the son of Ezra Fuller and Caroline (Jordan) Fuller, both parents being of French descent. He received his early education in Hopkinton, St. Lawrence county, N. Y., and studied medicine under the preceptorship of R. G. Scroggs, Professor of Physiology in the Miami Medical College of Ohio. In 1876-77, he attended medical lectures at the Louisville Medical College. He married March 14, 1875, Mary Ellen, daughter of Samuel Hushaw, of Prairie City, Ill. He located in Millbrook, Kan., where he was engaged in general practice for several years; his medical education was supplemented by attending the College of Physicians and Surgeons, of Chicago, Ill., where he was appointed assistant in the chair of Gynecology. Soon after this he was appointed a member of the State Board of Health of Kansas; and was also appointed surgeon for the K. P. Railroad, which position he retained until his removal to Baker City, Oregon, in 1888. He has devoted himself to gynecology, and acquired great experience and national wide reputation as a quick and skillful diagnostician and operator. He is a member of several medical societies. In 1889 he contributed several articles to medical literature.

GAERTNER, Frederick, of Pittsburgh, Pa., was born July 25, 1860, at Fort Russell, Madison county, Ill. He is of German descent, and a relative of the distinguished anatomist of the same name. His father came to America in 1848, and first settled in St. Louis, Mo., but after a few years became a citizen of Illinois. From 1866 to 1876 young Gaertner attended a country school at the old Fort Russell. From

1876 to 1879 his father sent him to the St. Louis High School, and also gave him a business course at the Mound City Commercial College, from which he graduated, and in 1879 he entered the St. Louis Medical College as a junior student, when the late John T. Hodgen, the eminent surgeon, was as yet at the head of the medical faculty. During the summer vacation young Gaertner did not go home as the other students did, but remained in the office of his preceptor, Dr. Joseph Pogue, of Edwardsville, Ill., for study. In 1882 he graduated, receiving the degree M. D. from the St. Louis Medical College; he also received instructions and attended the clinics at St. Johns, Sisters and St. Louis City Hospitals. The young doctor was at once sent to Europe to enter upon a thorough training in medicine and surgery, and especially to get a thorough knowledge of the use and application of the microscope. Dr. Gaertner had seen by this time that it was an impossibility to become a scientific and practical physician without first having mastered microscopy. He therefore,

Frederick Gaertner..

in 1882, entered upon a thorough course at the Königlichen-Friedrich-Wilhelms-Universität zu Berlin, and upon private and special courses with Professors Virchow, Langenbeck, Schröder, Westphal, Martin, Fritsch, DuBois Raymond, Liebrich, Guttman and others. He studied surgery and surgical pathology with Prof. Von Langenbeck; with Virchow, he studied microscopy, pathology and pathological histology. In the summer vacations he secured special permits from Prof. Virchow to work in his pathological and histological laboratories, where he experimented upon living cats, dogs and rabbits. At Berlin he attended the clinics at the Königlichen-Charité-Krankenhaus, and also the Poliklinik in dem Königlichen-Universitäts-Klinikum, and Chirurgischen-Klinikum. During the years 1883 and 1884, at Vienna, Austria, he studied

medicine, surgery and microscopy. At Vienna, he had private and special courses with Professors Billroth, Brücke, Schenk, Kundrat, Bamberger, Schnitzler, Schrötter, Gruber, Uitzmaun, Dittle, Braun, Kaposi and others. With Professors Rokitsansky, Kundrat and his assistants, Doctors Kolisko and Zemaun, he studied gross pathology, pathological histology, microscopy, and the technique of post-mortem examinations. From the K. K. Universität zu Wien (Vienna University) he received his degree D. M. (Doctor der Medicin), and honorary certificates of proficiency from all the professors at the Vienna University, at the Kaiserlichen und Königlichen Allgemeinen Krankenhause, Allgemeinen Poliklinik, and in dem Anatomischen Institute des Ehemaligen Josephinums. He received special permits to visit the wards regularly and treat the patients. From Vienna he went to Strassburg to complete his studies with Professors Von Recklinghausen, Hoppe-Seyler, Schwalbe, Goltz, Jolly, Lücke, Schmiedeberg, Freund, Kussmaul Laqueur and others. With Prof. Hoppe-Seyler he studied pathological and physiological chemistry, and with Prof. Von Recklinghausen he worked in his pathological laboratory and studied pathology, pathological anatomy, pathological histology, the technique of post-mortem examinations and microscopy. From the University of Strassburg he received the degrees of A. M. and M. D.; he also attended the remarkable clinics of Professors Kussmaul and Lücke, at the St. Stepan Hospital at Strassburg. Thence he visited the Hospital Generale de Paris, Pasteur's Inoculating Institution, the hospitals in London and Dublin, whence he returned home. He soon after located in Pittsburgh to practice his profession, that of medicine and microscopy. Dr. Gaertner is not only an eminent physician, but a scientist and microscopist. He has a collection of 6,000 slides of microscopic specimens, histological and pathological tissue—even embryonic tissue—which he values very highly as the result of his own labor. Of late years Dr. Gaertner's contributions to the magazines and scientific journals are principally articles of scientific and microscopic nature, all with an objective point of view. He does not write regularly for any publication or magazine, but when his time permits, indulges in the "*co-coethes scribendi*," which is growing more severe as he grows older. Dr. Gaertner is editor of several scientific magazines and journals, and has a world-wide reputation as a writer, observer and investigator. He is also associate editor of the *Dental and Surgical Microcosm*; associate editor of the *International Journal of Microscopy and Natural Science*; associate editor of the *Observer*, another microscopical journal, of Portland, Conn., and collaborator of the *Bacteriological World*, of Battle Creek, Mich. He enjoys a very large and extensive practice in Pittsburgh and Allegheny City, and is very frequently called into court as expert witness in medico-legal cases. Recently he has written several articles of length, as follows: "Concerning the Differentiation of Black Pigment in the Liver, Spleen and Kidneys from Coal-dust Deposits;" "Concerning the Rules and Application of Reichert's Haemometer;" "The Microscope the Principal Factor in Discriminating Medical, Medico-Legal and Legal Complications;" "Vivisections" (*American Naturalist*); "The Unavoid-

able Application of the Haemometer in the Differentiation of Surgical and Gynecological Complications;" "Hayes' Process of Generating and Applying Anesthetics;" "Koch's Discoveries, and His Cure for Tuberculosis;" "Asiatic Cholera—Its Cause and its Preventive" (in the *International Medical Magazine* of January, 1893); "The Grapho-Prism and its Use;" "The Microscope" (in the *October Arena*), and many other scientific articles too numerous to mention. All of his work and articles are based upon the highest scientific advancement, advocating in all respects a higher education, both progressive and aggressive, characterized by terseness of expression and a marvelous significance. Four years ago he was offered by two different medical institutions the Chair of Professor of Pathology and Pathological Histology, which he declined. Dr. Gaertner has already credited to his reputation as a bold surgeon several capital surgical operations; two laparotomies, and one gastrotomy (a resection of the pyloric end of the stomach) for cancer, with apparently good results. He is a great advocate of the introduction of compressed air into the lungs, especially by the fanning process; he claims to have kept patients alive for hours and days, when in condition of collapse and extreme weakness.

GAILLARD, Edwin Samuel, of Louisville, Ky., was born January 16, 1827, in Charleston district, S. C., and died February 1, 1885. He graduated in the South Carolina University, in December, 1845, and at the Medical College of South Carolina, with the first honor, in March, 1854, settling the same year in Florida, where he practiced until March, 1857, when he removed to New York, going the following August to Europe, and returning the following November. In March, 1861, he went from New York to Baltimore, and two months later he joined the Confederate Army at Richmond. He was appointed assistant surgeon of the First Maryland Regiment, in May, 1861; surgeon of the same regiment, and also brigade surgeon in August, 1861; medical inspector of the Army of Virginia in September, 1861; medical director of one-half of the army, in October, 1861; a member of the medical examining board of the Army of Virginia, in December, 1861; medical director of the Department of Aquia, in March, 1862; medical director of one-half of the army around Richmond, in May, 1862, losing his right arm in the battle of the Seven Pines, May 29, 1862, but reporting for duty the following August; medical director of the Department of North Carolina and Virginia, being in charge of all the hospitals of these two States, in September, 1862, shortly after which he was invalided for three months; medical inspector of the Hospital Department of Virginia, in April, 1863; and in December, 1863, general inspector of the Confederate hospitals, serving in that capacity till the close of the war. In May, 1865, he took up his residence in Richmond, Va., whence in May, 1868, he removed to Louisville, Ky. In 1861, he received the Fisk Fund prize, and in 1865 the prize of the Georgia Medical Association; he founded, in January, 1866, the *Richmond Medical Journal*, which he moved to Louisville, in 1868, and published there under the name of the *Richmond and Louisville Medical Journal*; and established the *American Medical Weekly*, in July, 1874. Dr. Gaillard was a vig-

orous writer, and one of the most noted medical journalists of the country, but on account of the loss of his right hand he performed his professional and literary work under the greatest difficulty. In August and October, 1873, he received from the University of North Carolina the degrees of A. M. and LL. D. He was a member of the Medico-Chirurgical Society of Louisville, of which he was elected president, in December, 1868; the various other medical societies of Louisville; the Richmond Academy of Medicine, of which he was elected president in 1867; the Kentucky State Medical Association; the American Mutual Benefit Association of Physicians, of which he was elected president, in March, 1875; and the American Medical Association; a corresponding member of the Louisville Obstetric Society, and of the Boston Gynecological Society; an honorary member of the South Carolina Medical Association; and an honorary and corresponding member of the College of Physicians and Surgeons of Arkansas; and was formerly a member of the Florida State Medical Society, of which he was elected vice-president, as also annual orator. In June, 1867, he was made Professor of General Pathology and Pathological Anatomy in the Medical College of Virginia; and in May, 1868, he was elected to the same chair in the Kentucky School of Medicine at Louisville, of which he became dean. In August, 1869, he was appointed Professor of the Principles and Practice of Medicine and General Pathology in the Louisville Medical College of which he was the first dean. He was married in 1856, to Jane Marshall Thomas, daughter of the Rev. Ed. Thomas, of Charleston, S. C., who died in April, 1860, leaving no children; and, October 5, 1865, to Mary Elizabeth Gibson, daughter of Prof. C. B. Gibson, of Richmond, Va., and granddaughter of Prof. Wm. Gibson, of the University of Pennsylvania. By this marriage four children survived him.

GALBRAITH, Thomas S., of Seymour, Ind., was born in Bartholomew county, Ind., March 9, 1846. His early education was obtained at Hartsville College. He attended a full course of medical lectures at the University of Michigan in 1864 and 1865, and was graduated from the Ohio Medical College, in the class of 1866. He commenced the practice of his profession in Bartholomew county. In 1870, he located in Seymour, where he still resides. In 1877, Dr. Galbraith spent four months in post-graduate studies in New York City, where he had the good fortune to meet such eminent men in the profession as Edmund R. Peasley and J. Marion Sims. During the winter of 1880, and again in the winter of 1881, he was at Mt. Sinai Hospital, New York, under the instruction of Dr. Paul F. Mundi, in the diseases of women. In 1886, he spent a few months abroad, visiting hospitals in Ireland, Scotland and England. Dr. Galbraith has made frequent contributions to medical Journals, mainly on the subjects of gynecology and obstetrics. In 1879, he originated a new procedure in obstetric practice—"The Dislodging of Locked Twins," an account of which was published in the *American Journal of Obstetrics*, Vol. XV (1882), page 919; also mentioned in Parvin's Text Book of Midwifery. In 1887, without solicitation on his part he was elected to the superintendency of the Indiana Hos-

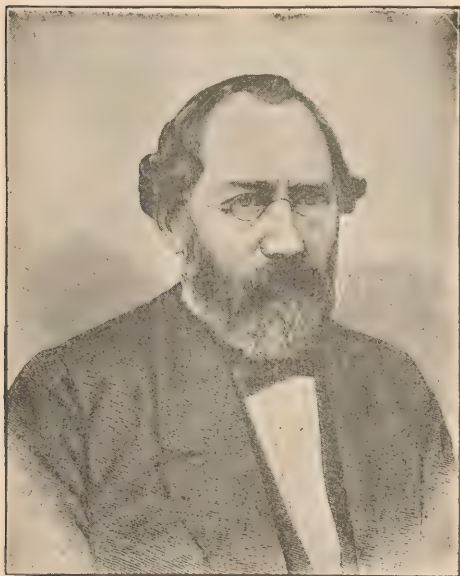

T. S. Galbraith.

pital for the Insane (now known as the Central Indiana Hospital for the Insane). The work of the hospital during his administration was maintained at a high state of efficiency. The position, however, proved to be undesirable owing to the many political complications in which the trustees were involved. In 1889, he resigned and returned to Seymour, where, in 1891, he established a private sanitarium for the treatment of the diseases of women, which is now in successful operation.

GALL, Alois D., of Indianapolis, Ind., was born in Wiel-die-Stadt, Wurtemberg, March 16, 1814, and died February 11, 1867. His early life was spent in his native town. With a decided bent for learning and an aptness in acquiring knowledge he was sent to Stuttgart and there continued his studies. On completing his course, his young and adventurous spirit which desired expansion it could not then find in his own country prompted him to seek in the United States a field for the exercise of his ability. In 1842, therefore, he came to America and settled in Green Bay, Wis., where he purchased land and remained one year, after which he removed to Pittsburgh, Pa., and studied medicine with Dr. Gross. After his graduation in medicine he established himself at Zellianoble, whence, after a year of active and laborious practice, he removed to Slippery Rock and subsequently to Portersville, in Pennsylvania. The struggles of the young physician need not be here enumerated. The early days of his practice in those villages, in the Keystone State, were a rugged discipline that gave him strength and courage for other and larger fields in the years to come, and enabled him to bear greater responsibilities. In 1847 he removed to Indianapolis, Ind., where he at once established a successful practice, which was continued until 1853, when he was appointed United States Consul at Antwerp, Belgium, which position he held through the administrations of Presi-

dents Pierce and Buchanan. In this responsible position he merited and received the hearty approbation of his government and of all her citizens with whom he came in contact, discharging all the duties of his office with honor to himself and credit to the power he represented. As an illustration of this, it is said that he was exceedingly popular with all American captains who put in at the port of Antwerp, and that as an expression of their appreciation of his fidelity to the United States, and the interest of her citizens abroad, they presented him with a beautiful and elaborately wrought gold-headed cane, which he always counted among the chief of his treasures. In 1860 he returned to Indianapolis to be met with the warmest greetings of old and appreciative friends, and resumed his professional labors. In 1861, feeling the call of duty, he entered the army as surgeon of the Thirtieth Indiana Volunteers. Within a brief period he was appointed brigade surgeon, and later, his ripe experience as a physician and surgeon becom-

Alois D. Gall.

ing known, medical director of General Peck's Corps. After three years of arduous duty in the field, resulting in the impairment of his health, he resigned. Previous to returning home the officers of his regiment, who well knew his army service and the self-sacrificing spirit in which they had been given, presented him a magnificent sword as a testimonial of their appreciation and esteem. Returning to civil life he again entered upon the duties of his profession, which continued to engross his attention until his death, which occurred about three years afterward from an attack of apoplexy. His wife, to whom he was married in Stuttgart in 1839, and one daughter and two sons survived him, the oldest of the sons being at this date treasurer of the State of Indiana. Dr. Gall was of a warm and sanguine temperament and genial as summer to his friends, whose name was legion. To the younger mem-

bers of the profession was this kindness most freely given, and his encouragement, advice and assistance many of the most prosperous physicians of Indianapolis now hold as a sweet and pleasant recollection. He was a Mason of high degree, and a sterling Democrat, much relied upon in the counsels of his party. He cared nothing for the honor and emoluments of office for himself, his inclination and duty keeping him in the path of his chosen avocation. There are numerous anecdotes of his heroism current in the profession to-day, for he was a man who shirked no duty and was absolutely without fear.

GARRETSON, James Edmund, of Philadelphia, Pa., was born in Wilmington, Del., October 4, 1828. Receiving his preliminary education at the Mantua Classical Institute, Delaware, he was subsequently for several years engaged in medical study under the supervision of private teachers, having attended twenty-four courses, principally on anatomy, surgery and obstetrics. In 1857 he entered the medical department of the University of Pennsylvania, receiving his degree in 1859. In the following year he succeeded to the Lectureship of Anatomy in the Philadelphia School of Anatomy and Surgery, and in 1865 was elected Professor of the Principles and Practice of General Surgery in the Philadelphia Dental College. This position he subsequently resigned in order to accept the appointment of Oral Surgeon to the University of Pennsylvania. Dr. Garretson is ex-president of the Medico-Chirurgical Hospital and Emeritus, Professor of Oral and General Clinical Surgery in the Medico-Chirurgical College of Philadelphia. For the past twenty-five or thirty years he has restricted his practice as closely as possible to the treatment of surgical diseases, especially devoting himself to the study of diseases of the mouth, jaws and face. As a surgical author he has published "Diseases and Surgery of the Mouth, Jaws, and Associate Parts," and "A System of Oral Surgery." He has also been a considerable as well as a successful contributor to general literature, his best known works being, "Odd Hours of a Physician," "Thinkers and Thinking," "Two Thousand Years After; or A Talk in a Cemetery," and "Hours with John Darby."

GARVER, John James, of Indianapolis, Ind., was born at Silver Lake, Ohio, February 14, 1845; and is of Scotch descent. In early life he assisted his father in conducting a farm. His literary education was obtained at Fairview High School, Ohio, and at a commercial school at Dayton, in the same State. He enlisted as a private soldier, January 30, 1862, in the Seventy-first Ohio Infantry, and served four years, participating in the battle of Shiloh, and those of the Atlantic campaign, and was in the battles of Columbia, Franklin, and of Nashville, Tenn. His regiment was, at the close of the war, ordered to the Rio Grande river, to prevent the Mexicans from crossing into the United States. During his service in the army he was offered, but declined, a lieutenant-colonel's commission of the Sixteenth United States Colored Troops. On returning to Ohio he engaged in the drug business for several years. In 1870 he commenced the study of medicine, with Dr. Oliver Crook, of Dayton (a brother of General George Crook, United States Army), as his preceptor, and was grad-

John J. Garver.

nated at the Ohio Medical College, in 1876, and then located at Indianapolis, Ind., where he has continued in a very successful general medical and surgical practice ever since. In 1881 he was elected superintendent of the City Dispensary, and served for five years, during which time he rendered very effective service to those entitled to its benefit as well as to the municipal government. In 1888, he was elected commissioner of the public schools, and has taken great interest in educational affairs, holding this position four years. In 1889, he received the appointment of United States examining surgeon for pensions, a position which he also held for a like period. Dr. Garver is a member of the Indiana State Medical Society and American Medical Association; and has written an important paper on general medicine. He has been a member of the Marion County Medical Society since 1881, and on January 3, 1893, was unanimously elected president of this organization.

GEDDINGS, William H., of Aiken, S. C., was born in Charleston, April 23, 1838, and died at Bethlehem, N. H., after a short illness on August 27, 1892. Dr. Geddings was the youngest son of the late Dr. Eli Geddings, of Charleston, S. C., and a brother of the late Dr. Frederick Geddings, of the same city, and Dr. Edward Geddings, of Augusta, Ga. Of a family of distinguished physicians he was himself one of the brightest ornaments of his profession in the United States. He first studied medicine at the Medical College of the State of South Carolina, at Charleston, and afterwards prosecuted his studies in the universities of Vienna, Berlin, Prague and Paris. At the commencement of the war between the States Dr. Geddings entered the Confederate Army in the line of his profession, and shortly afterward rose to the position of Chief Medical Purveyor of the Army of Northern Virginia, which high office he filled with distinc-

tion until the close of the war. He then settled in New York City and commenced the practice of his profession, but the health of Mrs. Geddings becoming impaired by the Northern climate, Dr. Geddings on that account moved South to Aiken in 1869, where he had ever since been continuously engaged in active practice; but for the past twelve years or more he had also engaged in a summer practice at Bethlehem, N. H., returning each fall to Aiken, the place he loved, where he was highly esteemed and enjoyed a lucrative practice, especially among the large number of visitors who were suffering with pulmonary diseases. Dr. Geddings was a learned and strong man and a great physician. It was not only as a successful practitioner that Dr. Geddings became noted. He also attained a national reputation for his learning and as a distinguished writer on medical and scientific subjects. His writings are numerous, and he contributed freely to the medical journals, especially on climatology and the diseases of the respiratory organs. He also contributed many articles on Dermatology, having been at one time a pupil of the great Hebra. The latest of these was "A Contribution to the History of Leprosy on the Eastern Coast of the United States," which excited much interest among dermatologists. He prepared the article "Aiken" in Wood's "Reference Handbook of the Medical Sciences." Perhaps one of his best articles was that on "Bronchial Asthma," prepared for "A System of Practical Medicine by American Authors," edited by Dr. Wm. Pepper. At the time of his death he was a member of the following societies: The American Medical Association, The South Carolina Medical Association, The Climatological Association, and the Dermatological Association.

GERRISH, Millard F., of Seymour, Ind., was born at Paris, Jennings county, that State, February 27, 1856. He is of English descent. His father, Dr. J. W. F. Gerrish, was an eminent physician and army surgeon (surgeon Sixty-seventh Indiana Infantry). His early education was that of common schools, and subsequently graduated at the Shields High School of Seymour in 1877. He entered his father's office as a student of medicine in 1872. He married Violet, daughter of James Molseed, of Philadelphia, Pa., April 3, 1879. He was graduated in medicine at the University of Pennsylvania in 1881, receiving honorable mention of thesis "The Etiology of Typho-Malarial Fever." Also receiving the degree of Ph. D. at the same school the same year; returning home, he at once entered the practice of his profession, supplementing his medical education at the New York Polyclinic in 1888. Like his father, being an admirer of surgery, he has met with unbounded success, being remarkably successful in railway injuries, and was surgeon to the Ohio and Mississippi Railroad for eight years, and is surgeon to P., C., & St. L. R. R., Louisville Division. He has been indefatigable in his efforts to be among the shining lights of his profession, and in the alleviating of suffering humanity. He was one of the first to telegraph his services to the Johnstown sufferers. He is a permanent member of the American Medical Association, Association Railway Surgeons, Indiana Medical Society, Mississippi Valley Medical Society, Mitchell District Medical Society, president

Jackson County Medical Society, president Board of Health of Seymour, and United States Examining Surgeon for Pensions.

GIBSON, William, of Philadelphia, was born in Baltimore, Md., March 14, 1788, and died at Savannah, Ga., March 2, 1868. He received his early education in the former city, and at St. John's College, Annapolis. He subsequently went to Princeton College, and remained during the session of 1803-4, leaving the institution before the time that his class graduated. He commenced the study of medicine with Dr. John Owen, of Baltimore, and in 1806 attended a course of lectures in the University of Pennsylvania. He himself tells us that, upon his arrival in Philadelphia, he heard the first public lecture he ever listened to. It was from his distinguished predecessor, Dr. Philip Syng Physick. Struck with the peculiar appearance of that extraordinary man, and with the precepts he poured forth, his attention was riveted to every action he displayed and every word that fell from his lips. (See Introduction Lecture, November 1, 1841.) At the close of the lectures he sailed for Europe, and first repaired to Edinburgh, where he spent the summer in witnessing the private practice and operations of the celebrated John Bell, then in the zenith of his fame—in attending botanical and natural history lectures, and in devoting particular attention to hospital practice. He graduated at the University of Edinburgh, in 1809, having written a thesis entitled, "De Forma Ossium Gentilium." The materials for this inaugural Latin dissertation were obtained from the museum of Monro. It was descriptive of the different forms of the bones pertaining to the races of mankind, and has been quoted by Pritchard, and other writers, in connection with their ethnological researches. The science of ethnology was at that time almost in its infancy. On a journey from Edinburgh to London, he formed an acquaintance with a brother of Sir John Moore, commander of the British Army in Spain, who was killed at the battle of Corunna, and received from this gentleman such testimonials as enabled him to procure the means of witnessing, "in an unofficial capacity," after the arrival of the wounded in England, the important cases of gunshot wounds, and other similar injuries, which occurred at that battle. It is probable that Dr. Gibson was thus first brought into close association with Sir Charles Bell, who was at the time a practitioner of surgery in London, and who had been detailed to assist in the care of the wounded soldiers. He entered, as a private pupil, the family of Sir Charles Bell, and with his taste for artistic delineations, had ample opportunities for improvement under the direction of so consummate a teacher. In 1809 there was a galaxy of distinguished medical men, at the height of their reputation, in London, of whom Dr. Gibson has mentioned Mr. Abernethy and Sir Astley Cooper as conducing to his improvement by their interesting lectures. After his return home in 1810, after three years' absence, Dr. Gibson entered upon the practice of his profession in Baltimore, and two years afterwards was appointed to the Chair of Surgery in the University of Maryland. This institution had recently been established, and in it he was associated with Drs. Davidge, Potter, Baker, De Butts and Hall. In 1812 he served as a medical officer

in the militia of Maryland, at the time of the attack of the British on Baltimore, and in 1814 revisited Europe and fought on the side of the allied forces at the battle of Waterloo, where he was slightly wounded. He became intimate with the surgeons, Sir Astley Cooper, Velpeau, Abernethy, Hastings and Halford, and was the friend and companion of Lord Byron. Dr. Gibson not only made frequent visits to Europe, but also traveled in remote regions of Asia and Africa. In 1819, upon the death of Dr. Dorsey, when Dr. Physick was transferred to the Chair of Anatomy in the University of Pennsylvania, Dr. Gibson was elected to fill the vacant Chair of Surgery. In 1855 he resigned this chair, which he had held for thirty-six years, and was appointed Emeritus Professor of Surgery. It would be no small praise to state that Dr. Gibson fully sustained the reputation he brought with him from the University of Maryland, in the new position to which he had been called as the successor of Dr. Physick, the founder and illustrator of the Chair of Surgery in the University of Pennsylvania. "As a lecturer he was clear and emphatic; his voice was distinct and melodious; his language was well chosen, and his style of enunciation was attractive. His demonstrations of surgical anatomy were readily comprehended by the student; some of them especially, as those in connection with the neck, with hernia, and with lithotomy, could not be surpassed in lucid exposition." For purposes of demonstration, Dr. Gibson had himself prepared, and procured by purchase, an ample collection of morbid structures, diseased and fractured bones, models and casts, as well as pictures of large size, illustrative of disease, or of the anatomical parts of the body involved in operations. To these were added the approved mechanical appliances of the day. In thus teaching, he set the example that has been followed extensively by other surgeons. As an operator Dr. Gibson was undoubtedly dexterous; of his operations and cases, a number were from time to time communicated to the journals. In the treatment of fracture of the thigh, he placed before the notice of practitioners of this country a modification of the apparatus known as Hagedorn's, and published a case that had been treated by it in the *Journal of Medical and Physical Sciences*. Dr. Gibson was the first surgeon to perform the Cesarean operation twice successfully to both mother and child, on the same patient. The details of the two operations have been published in the *American Journal of the Medical Sciences*, August, 1835. Dr. Gibson published in 1824 his "Institutes and Practice of Surgery," being "Outlines of a Course of Lectures." This work was intended as a guide to the students attending his lectures, and is marked for its accuracy of style and language. It passed through six editions, having been amended and improved; the last edition (of 1841) being so enlarged as to constitute a considerable treatise on surgery. He published, in 1836, a paper entitled "A Sketch of Lithotripsy, with Cases," and in 1841 was issued his "Rambles in Europe, with Sketches of Prominent Surgeons and Physicians, Medical Schools, Hospitals, Literary Personages and Scenery." At the age of seventy, having acquired a fortune, he retired from practice and removed to Newport, R. I. He died while sojourning in the South at the advanced age of eighty years.

GIFFEN, Robert Emmett, of Lincoln, Neb., was born in Coatsville, Chester county, Pa., August 25, 1859. He is of Scotch-Irish descent. His father, James E. Giffen, was Principal of the Chester County Academy, and comes of an old Scotch family. His mother, Mary Jane (Galt) Giffen, is of one of the oldest families in Lancaster county, Pa., her forefathers having settled there in the days of William Penn. His early education was confined to winter school and night study, and at the age of sixteen taught one term in a district school. The following spring, 1876, he went to New York City and became a student of Dr. Joseph W. Howe; who placed him in St. Francis Hospital during the summer, where he learned the first rudiments of surgery. He took his first course at the University of New York, then at Bellevue Hospital Medical College from which

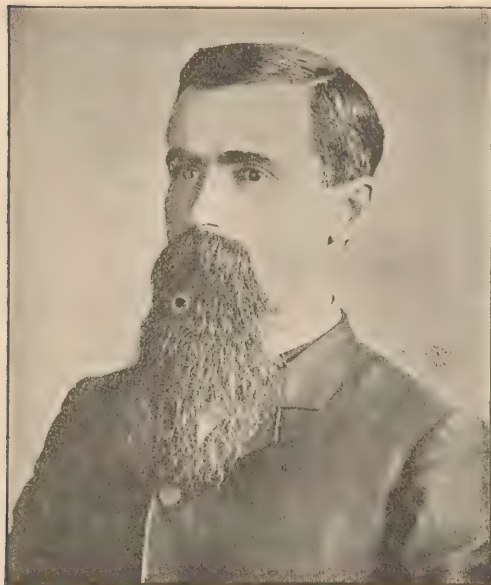

Robert Emmett Giffen

he graduated March 1, 1880. He entered Charity Hospital the same year as house surgeon for two years, then for three years his time was divided among the Maternity Hospital, New York Dispensary, Demilt Dispensary and Children's Hospital. He then returned to his old home in Chester county, Pa., where he remained until the spring of 1887, when he located in Lincoln, Nebr., turning the greater part of his study and work to surgery. In 1889 he succeeded in founding a hospital which was placed under the control of the Sisters of St. Francis. He has performed thirty-three abdominal sections without a death, has trephined for depressed fracture of skull several times with perfect result, a number of times for vesical calculi, and perineal operations by the score. In 1890 he was elected to the Chair of Medical Jurisprudence in the State University of Nebraska. He was the same year appointed City Physician and Chief of Staff of

St. Elizabeth Hospital. He is a member of his county and State medical societies and Colonel and Surgeon-General National Guard, Neb.

GIHON, Albert Leary, of the United States Navy, was born in Philadelphia, Pa., in 1833, and graduated first in his class at the Philadelphia high school in 1850; studied medicine and graduated from the Philadelphia Medical College in 1853. In the same year he became Professor of Chemistry in the Philadelphia Medical College, holding the chair until the following year, when he resigned to enter the medical department of the navy. He was appointed assistant surgeon on May 1, 1855, and attached to the sloop "Levant" of the East India squadron, and served in that vessel until 1858. During that year he was attached to the brig "Dolphin," forming part of the Brazil squadron and the Paraguay expedition. In 1859 he was promoted to passed assistant surgeon. August 1, 1861, he was commissioned as surgeon. From 1862 to 1865 he served on board the sloop "St. Louis," engaged on special service. During 1866-67 was on duty at the navy yard, Portsmouth, N. H., and from 1868 to 1870 on board the storeship "Idaho," attached to the Asiatic squadron. In 1872, he was promoted to be Medical Inspector, with the relative rank of Commander, and in 1879, Medical Director, with rank of Captain. In 1887 he was stationed at Mare Island, California, but is now on special duty at New York City. His published works are, "Practical Suggestions in Naval Hygiene," 1871; "The Need of Sanitary Reform in Ship Life," "Sanitary Common Places Applied to the Navy," 1877; "Prevention of Venereal Diseases by Legislation," 1882, and numerous professional papers published in the reports of his department, and in the medical journals. He is also a constant contributor to magazines and newspapers. Dr. Gihon is an honored and active member of the American Medical Association, and has attended the meetings for many years in the capacity of delegate from the medical department of the United States Navy.

GILLESPIE, Green B., of Covington, Tipton county, Tenn., was born in Gordon county, Ga., in 1844, of an old South Carolina family of Scotch-Irish descent. He received an academical education, and served in the Confederate Army during the latter part of the war as a private in the First Regiment of Cavalry from his native State. He read medicine under Dr. Howard of Fulton, Miss., and graduated from the Medical Department of the University of Nashville, and Vanderbilt University in 1875. He commenced the practice of his profession in Chickasaw county, Miss. He removed to Moscow, Ky., in 1877. He continued the practice of his profession, forming a co-partnership with his college friend and classmate, Dr. S. M. Payne, who is now an oculist in New York City. From Kentucky Dr. Gillespie removed to Covington in 1879, and formed a co-partnership with Dr. L. Hill, Sr., one of the leading physicians of West Tennessee; which association was very pleasant for one year, when Dr. Hill retired from the practice. Dr. Gillespie has from the beginning of his professional life had a great fondness for surgery, and has turned his especial attention in that line, more particularly to the surgical diseases of women. He took a special course in gynecology in New Orleans in 1884-85: and in 1889 attended the

Dr. B. Gillespie

hospitals of London, Vienna and Berlin. His principal operations have been on the female, among which have been several laparotomies. He was the first surgeon in his State to perform Emmet's operation for the repairing of a lacerated cervix (1880). In the last two years he has opened a private sanitarium for the treatment of diseases of women. Dr. Gillespie does much in treating the eye, nose, throat and ear. He has done a number of cataract operations. The Doctor is a member of the American Medical Association; has served on the judicial council. Member of Tennessee State Medical Association; West Tennessee Medical and Surgical Association; The Tri-State Medical Association of Mississippi, Tennessee, and Arkansas; is now president for the third term of the Tipton County Medical Society. Besides doing a very large practice, the Doctor finds time to take an interest in business affairs, being president of the Farmers Union Bank, and president of a large and thriving building and loan association.

GILLIAM, David Tod, of Columbus, O., was born in Hebron, O., April 3, 1844. He is a son of William and Mary Gilliam, both of Eastern Virginia. On his mother's side he is a descendant of the Lee family, of which General Robert E. Lee was the most illustrious representative. He received a common school education, the long-cherished collegiate course being prevented by the outbreak of the war. He entered the Union service in the spring of 1861, being then but seventeen years of age—a pale, delicate boy. The change was beneficial to his health, and he remained constantly in the field until the fall of 1862, when, as commander of the rear guard of a retreating army, he was shot through the chest and taken prisoner. He was started to Libby prison, but on account of his critical condition was left by the wayside. Five weeks later, he

managed to escape, and after a perilous and fearful journey through the wilds of Western Virginia, arrived at his home at Middleport, O., to the utter surprise of every body, as he had been published dead. With shattered health he pursued his studies, clerked in a store, attended commercial college, and finally took up the study of medicine, reading at nights after his day's work was completed. He enlisted again, but was immediately discharged for physical disability. In 1866, he married Lucinda, daughter of Judge T. L. Minturn, of Athens county, Ohio. In 1871, he graduated from the Medical College of Ohio, at Cincinnati, and resumed practice at Nelsonville, O. He was an active contributor to medical literature; and in 1877 was called to the chair of General Pathology, in the Columbus Medical College, to which city he removed. Here he soon acquired a lucrative practice. In 1880 he accepted the chair of Physiology in Starling Medical College, and in 1885 that of Obstetrics and Diseases of Women, in the same institution, which he has held ever since. He is also gynecologist to the St. Francis and St. Anthony Hospitals. For some years Dr. Gilliam has given special attention to gynecological work and abdominal surgery. In this latter department he has achieved a gratifying success, his rates of recoveries in the last series being ninety-five out of one hundred.

Dr. Tod Gilliam

He is the author of two books ("The Essentials of Pathology" and "The Pocket-Book of Medicine"), besides many papers on medical subjects, chiefly confined to his specialty. He is a member of the Ohio Medical Society, the American Medical Association, and the International Medical Congress. His family consists of two sons and one daughter, the elder son being a physician, and his father's chief assistant; the other a lawyer of much promise.

GOELET, Augustin H., of New York City, was born near Wilmington, N. C., April 1, 1854. His father, Edward H. Goelet, was of French, and his mother, Virginia Lane Goelet, of English descent. The former was a physician prominently known throughout North Carolina, and was a direct descendant of the original Jean Goelet who came to this country with the first Dutch settlers and located on Manhattan Island. The family fled from France to Holland during the persecution of the Protestants. Of southern birth, and educated in early life at the Cape Fear Military Academy, it was natural that Dr. Goelet should have attended a southern college. After reading medicine with his father as preceptor, he entered the University of Virginia, and in 1873, graduated in some of the departments pertaining to medicine after a very severe course of study there. Of decidedly studious habits, he nevertheless found time to join his fellow-students in most of the popular under-

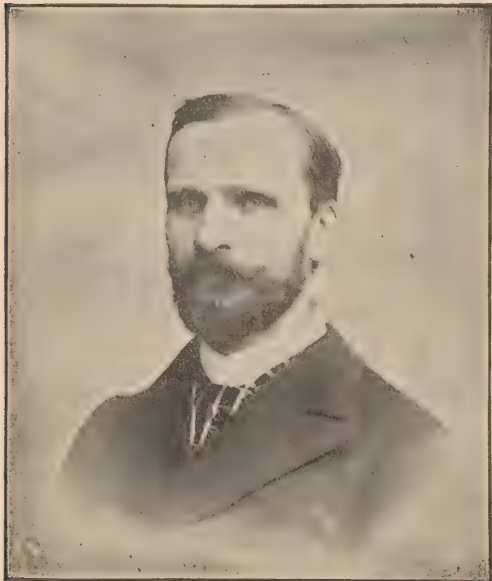

A. H. Goelet.

graduate organizations. He was there an active member of the Washington Literary Society and a prominent member of the Beta Chapter of the Zeta Psi Fraternity. Upon leaving the university he came north to continue his studies at the Bellevue Hospital Medical College, graduating in 1874. He then received a hospital appointment in the Reception Hospital, surgical department Bellevue Hospital. When Apostoli came to this country a few years ago and read a paper upon the application of electricity to certain diseases of women before the International Medical Congress at Washington, Dr. Goelet decided to investigate his claims. After two years' thorough and exhaustive investigation he became so thoroughly convinced of its value as a therapeutic agent that he visited Paris and worked with Apostoli in his clinics. As a result of his success here and abroad, the greater part of his

time is now absorbed in the treatment of special cases sent to him by brother physicians and former patients; such, for instance, as the electrolytic decomposition of tumors and the application of electricity to other diseases comprised in this special branch. Naturally of a mechanical bent of mind, he is the inventor of a modification of the Sims Speculum, known as Goelet's Speculum, and of numerous electrodes for electro-therapeutic work in gynecology. The Doctor limits his practice to gynecology, and is now regarded as the leading exponent of gynecological electro-therapeutics in this country. Dr. Goelet is a prodigious worker. Notwithstanding a large practice of the most wearing and exacting nature, he has made some very valuable contributions to the literature of our profession. He is the author of "The Electro-Therapeutics of Gynecology," published in 1892; also of various contributions to medical journal literature, among which are the following: "Dilatation and the Intra-Uterine Stem in the Treatment of Dysmenorrhœa and Sterility," "Dilatation *versus* Divulsion," "A New Suture Fastener for Silver Wire, especially adapted for Operations upon the Cervix and Perineum," "The Value of Electricity as a Substitute for Laparotomy in Diseases of the Uterine Appendages," "The Treatment of certain Pelvic Tumors by Galvano-puncture and Drainage by the Vagina," "Conservative Treatment of Diseases of the Uterine Appendages and Sequelæ," "The Rational Treatment of Uterine Displacements, based upon a Consideration of the Pathological Condition," "The Treatment of Menorrhagia and Metrorrhagia by the Galvano-caustic Action of the Positive Pole," "The Action and Application of the Faradic Current in Gynecology," "Electricity *versus* the Curette in the Treatment of Bleeding Fibroids of the Uterus." He is Fellow of the New York Academy of Medicine, Fellow of the New York Obstetrical Society, Fellow of the American Electro-Therapeutic Association, member of the Société Française d'Electrotherapie, and member of the New York County Medical Society. He was editor of the Archives of Gynecology, Obstetrics and Pædiatrics, in 1891 and 1892; president of the American Electro-Therapeutic Association for 1893, and was twice its vice-president. Dr. Goelet is widely known both in this country and in Europe as an expert gynecological surgeon of the most conservative type.

GOLDSPOHN, Albert, of Chicago, Ill., was born in the township of Roxbury, Dane county, Wis., September 23, 1851, of German parents. They permitted nothing but the correct German language to be spoken in the family, and, by practice and precept, inculcated the habit of constant industry. These features in his early training were of great advantage to him subsequently. Attendance at a country district school during winter sessions, when his services as the oldest child of the family were not too greatly needed to do chores and light work on his father's farm, and private study and practice of penmanship during rainy days, constituted his educational facilities up to the seventeenth year. After that time his parents secured for him better opportunities in graded schools and Northwestern College, at Naperville, Ill. From the latter institution he graduated in June, 1875, as Bachelor of Science, having completed the Latin scientific

course. In February, 1878, he graduated as Doctor of Medicine, at Rush Medical College, Chicago, and received a special certificate for attendance upon three winter and three spring courses. Six months previous to this time he entered the competitive examination for a position as interne (resident physician and surgeon) in Cook County Hospital, which position he obtained and occupied until the service, which is limited to eighteen months, expired March 1, 1879. His next object was to earn the means with which to pursue a course of post-graduate study in Europe, and for this reason he began his private practice at the suburban town of Des Plaines, Ill., sixteen miles from Chicago, because an extensive general practice is usually more quickly acquired in the country than in a large city. In this,

Albert Goldspohn

his expectations were fully realized, as he was soon occupied to the fullest extent during the greater portion of each year; but the work was very laborious and oftentimes became quite irksome from want of sleep. Six years of hard work passed here very quickly, and were rewarded by much experience. One very sad incident mars the memory of those otherwise prosperous years. This was the death of his beloved wife, formerly Miss Victoria E. Esher, to whom he was married October 22, 1879. To her devotion, sympathy and practical assistance, as well as to her constant industry and frugality, he attributes no small share of the results of his work there. On June 29, 1885, while he was himself convalescent from typhoid fever, she died at the house of relatives in Chicago, from a severe attack of the same disease, with grave complications. On October 15, of the same year, he introduced Dr. H. C. Thiele (deceased) in his

field of practice. This was more than a business transaction. Pathetic farewells were very numerous. He now discovered that former instances of intense mutual interest in cases of dangerous illness had created ties of gratitude and esteem in very many families that were still unbroken. Hereupon he went to Europe and devoted two consecutive years continuously and closely to post-graduate studies related to general surgery, and particularly to surgery incident to the diseases of women. Being thoroughly familiar with the German language, his time was divided into periods of variable lengths of attendance at the German universities of Heidelberg, Wuerzburg, Strassburg, Halle an der Saale and Berlin in succession. Since August 4, 1887, the eve of his return to America, he is married to Cornelia E. Walz. On October 15, 1887, he began practice in Chicago, and about six months later he was appointed as one of the attending surgeons to the German Hospital. He is a member of the Chicago Medical Society, of the Illinois State Medical Society, and of the American Medical Association. He was appointed Professor of Gynecology at the Chicago Post-Graduate Medical School and Hospital in June, 1892.

GOODELL, William, of Philadelphia, son of the Rev. William Goodell, D. D., missionary to Turkey, was born on the island of Malta, October 17, 1829. He was graduated at Williams College, Massachusetts, 1851, and studied medicine at Jefferson Medical College, graduating in 1854. He married in Smyrna, Asia Minor, September, 1857, Caroline D., daughter of the late Judge Thomas S. Bell, of West Chester, Pa. He practiced his profession first at Constantinople, Turkey, and remained there till 1861, when, on account of the unsettled condition of political affairs, he removed to West Chester, Pa. In 1865 he was appointed physician in charge of the Preston Retreat, and came to Philadelphia, making a specialty of obstetrics and diseases of women. He was president of the Obstetrical Society of Philadelphia in 1873-74, and of the County Medical Society of Philadelphia in 1875, and vice-president of the American Gynecological Society in 1878. He is also a member of the College of Physicians of Philadelphia, corresponding member of the Boston Gynecological Society, of the London Obstetrical Society, of the Imperial Medical Society of Constantinople, and member of the American Philosophical Society and Pathological Society of Philadelphia. He is Professor of Clinical Gynecology in the University of Pennsylvania, and physician in charge of the Preston Retreat. Dr. Goodell has been a prolific writer on subjects connected with his specialty and is the author of a treatise issued in 1886, entitled, "Lessons in Gynecology," which on account of its practical character has had a wide circulation, and is regarded by the profession as a work of extraordinary merit.

GOODMAN, Henry Earnest, of Philadelphia, Pa., was born at Speedwell, near the former city, April 12, 1836. He is of German descent, and grandson of an officer in the Continental army. His professional education was received in the University of Pennsylvania, whence he was graduated M. D. in 1859. In the same year he established himself in Philadelphia, engaging in a general practice, but giving especial attention to orthopedic and ophthalmic

surgery. In May, 1861, he was commissioned surgeon of the Eighth, and in July, 1861, was made surgeon of the Twenty-eighth Pennsylvania Regiment; was appointed assistant surgeon of United States Volunteers May 6, and was promoted to be surgeon May 26, 1864. He subsequently served as surgeon-in-chief Second Division, Twentieth Army Corps, and as medical director of several army corps. In November, 1865, resigned his commission and left the service with the brevet rank of colonel of volunteers. While in the army he was, successively, surgeon in charge of the Twelfth Army Corps hospitals at Harper's Ferry, Acquia Creek and Gettysburg; after Gettysburg, was surgeon in charge of Camp Letterman, and later, of a division hospital, and was present at the battles of Ball's Bluff, Cedar Mountain, Antietam, Chancellorsville, Gettysburg, Lookout Mountain, Missionary Ridge, Ringgold, Resaca and numerous less important engagements. Of his notable cases may be mentioned amputation of leg near the great trochanter, and performance of tracheotomy, both successful. He is a member of the College of Physicians, Pathological Society, Ophthalmological Society, Social Science Association, Academy of the Natural Sciences (all of Philadelphia), American Medical Association and American Public Health Association. From 1866 to 1872 he was port physician of Philadelphia, and since 1866 has been examining surgeon to the United States Pension Bureau. In 1868 he visited the prominent European hospitals, and attended as a delegate the convention of the British Medical Association at Oxford, and the International Ophthalmological Congress at Heidelberg. He was one of the originators of the Philadelphia Orthopaedic Hospital, and of the Pennsylvania State Hospital for Women, and has served as resident physician Blockley Almshouse; resident physician Wills' Eye Hospital, and as surgeon to the same institution; surgeon Orthopaedic Hospital; surgeon outdoor department Pennsylvania Hospital; consulting surgeon Pennsylvania State Hospital for Women, and medical adviser Widows' and Orphans' Fund Life Insurance Company, Atlanta Branch. He married, April 11, 1874, the widow of the late Gov. John W. Geary, of Pennsylvania.

GOODWILLIE, David Henderson, of New York City, was born January 26, 1834, in Barret, Caledonia county, Vt. He comes from a long line of Scotch ancestors, men and women of marked traits of character, powerful intellects, and recognized leaders in the various walks of life which they chose to follow. His father, the Rev. Thomas Goodwillie, D. D., and his grandfather, the Rev. David Goodwillie, occupied the same Presbyterian pulpit for a period of eighty years, during which time they were elected to the Vermont State legislature and other responsible civil offices, also attending to their ecclesiastical duties. Dr. Goodwillie received his preliminary and classical education principally under the direction of his father, who was for many years President of the Caledonia County Academy, at which many brilliant men commenced their career. In 1855 Dr. Goodwillie went to Edinburgh, Scotland, to commence the study of his profession in that world renowned medical metropolis. After several years of study he returned to his native country and attended

medical lectures at the University of Pennsylvania and the Pennsylvania College of Dental Surgery, from which he received the degree of D. D. S.; the College of Physicians and Surgeons, New York; the University of New York and the University of Vermont which conferred on him the degree of M. D. in 1868. Dr. Goodwillie has a very logical and practical mind, and is much inclined to original scientific investigation and to invention. He has artistic ability. He was highly favored by the friendship and instruction, in private and hospital practice, of such eminent teachers as Drs. D. Hayes Agnew, and R. A. F. Penrose of Philadelphia; and Drs. J. R. Leaming, J. Marion Sims, James R. Wood, and others of New York. Very few possessed such opportunities in medical instruction, and this train-

D. H. Goodwillie

ing prepared him for his special professional work. He has said that any specialty is of more practical value, which has its origin in a personal, practical, widely extended knowledge in medical science. His professional labors are a fitting example of this truth. From his experience in private and hospital practice, he became exceedingly interested in the study of the diseases of the respiratory organs and associate parts. He devoted all his efforts to new methods, both medical and surgical in their treatment. As a result of the many years of faithful labor, he has probably the largest and most interesting collection in existence, consisting of preserved pathological specimens, colored wax casts of diseased parts, illustrations in oil, photographs, and drawings of the microscopic histology and pathology of the tissues. He has also a large amount of material in process of preparation. All of

these illustrate every form of disease of the lungs, throat, mouth, nose, ears and face. The whole collection was made by himself from cases coming under his knowledge, and contains their histories, methods of medical and surgical treatment, with the instruments devised and used by him. Dr. Goodwillie is widely known as an expert diagnostician in diseases of the respiratory and accessory organs, and as a skillful surgeon. He has performed many operations, of which he is the author. The following will indicate a few of them: In connection with a paper, "Subperiosteal Extirpation of Necrosed Bone of the Nose and Maxillae, without External Incision, and with Subsequent Reproduction of Bone and No Deformity," read before the International Congress, in London, England, in 1881. He made this operation by means of revolving surgical instruments and the electro-motor, on a patient in a London Hospital, before members of the Medical Congress. He was the first to introduce the use of the revolving surgical instruments and engine, in removing abnormal nasal or oral growths, or necrosed bone, in a paper read before the Medical Society of the County of New York, April 28, 1879 (Published in *Medical Record*, July 12, 1879). He read a paper, "Surgical Treatment of Naso-Pharyngeal Catarrh," before the American Medical Association, in 1880 (published in *Transactions*); a paper, "Electricity in Surgery, with Special Reference to its Use in the Nose, Mouth, and Throat," before the Medical Society of the State of New York, in 1891; and a paper, "Deafness as a Result of Nasal and Dental Diseases," before the New York Academy of Medicine (section in Laryngology and Rhinology), in 1889. He has written many other articles, which have been published in medical journals or books. His principal non-professional paper, "Ecclesiastical History," was delivered, by invitation of the United Presbyterian Synod of New York, at the Centennial Anniversary, August 27, 1891, of the United Presbyterian Church of Barnet, Caledonia county, Vt., of which his grandfather was the first pastor. In 1875, Dr. Goodwillie established a private hospital (the first of the kind in the country), for the better treatment of diseases of the lungs, throat, mouth, nose, ears, and face. He has now in preparation for publication, his experience in the treatment of the organs of respiration and the associate parts, fully illustrated by cases from his large experience, and now represented in his museum. He is a Fellow of the New York Academy of Medicine; member of the Medical Society of the State of New York; member of the Medical Society of the County of New York; and honorary member of the Canada Medical Society. He has been honored by these societies by appointment as delegate to represent them at other medical societies, both at home and abroad. It has been said, by one who knew Dr. Goodwillie intimately, "He is a genius, full of unlimited intellectual resources which have brought him honor in the profession which he loves; he is amiable and retiring in disposition, abounding in charities for the suffering and in good works for their relief."

GOULD, George M., of Philadelphia, Pa., was born November 8, 1848, at Auburn, Androscoggin county, Me., and is a descendant, on both the father's and mother's side, of

unmixed New England stock for six generations. His father moved to Salina, Athens county, O., in 1852, and from 1856 to 1861 the subject of this sketch lived there. In 1861, at the age of twelve, he enlisted as a drummer boy in the war, and in Company A, Sixty-third Ohio Regiment, he served until discharged from illness about two years afterward. Later in the war he enlisted again as drummer in the 141st Ohio, and served until the regiment was discharged. He was educated at the Ohio Wesleyan University, Delaware, Ohio, receiving the degree of A. B. in 1872. He studied at Cambridge, Mass., three years, and at Berlin, Leipzig and Paris for two years. He graduated at the Jefferson Medical College, Philadelphia, in 1888, and entered at once upon practice as a specialist in diseases of the eye. He is Ophthalmologist to Philadelphia Hospital, President of the American Academy of Medicine, editor of the *Medical News*, author of "The Meaning and the Method of Life, A Search for Religion in Biology," "A Pocket Medical Dictionary," and "An Illustrated Medical Dictionary," which have met with popular reception.

GRAEME, Thomas, was born in Balgowan, Scotland, October 20, 1688, and died near Philadelphia, Pa., September 4, 1772. He was one of the last of the foreign born physicians that were of prominence in colonial times. He came to this country in 1717, in the company of Sir William Keith, lieutenant-governor of Pennsylvania. Having previously studied medicine, shortly after his arrival he entered into its practice in Philadelphia, occupying an eminent place in his profession throughout his life. In 1727 he was appointed naval officer at Philadelphia, was again chosen in 1741, and continued to fill the office for more than twenty years thereafter. In February, 1726, he became a member of the provincial council, in 1731, a justice of the supreme court, in which office he served for many years. In 1749 he was chosen the first president of St. Andrew's Society, and in 1751-3 was physician to the Pennsylvania Hospital, of which charity he was one of the founders. He was one of the early members of the American Philosophical Society of Philadelphia. After a long career in medicine, in which pursuit he from time to time performed the duties of many offices of honor and public trust, he finally retired to his country seat in Bucks county, Pa., where he spent the remainder of his life. This country seat has been known by the name of Graeme Park. The influence of those intelligent and educated physicians, like Dr. Graeme, was of incalculable advantage in all the ways where science and learning in this early period of our country's history could be brought into requisition, but especially were their services important as teachers of their art and as preceptors of the rising generation.

GRAY, John Perdue, of Utica, N. Y., was born in Centre county, Pa., August 6, 1825, and died November 29, 1886. After receiving his academic education and graduating at Dickinson in 1846, he studied medicine and attended the medical department of the University of Pennsylvania where he was granted his medical degree in 1848. He early devoted attention to mental diseases, and in 1851 was appointed third assistant physician to the New York State Lunatic Asylum at Utica, and two

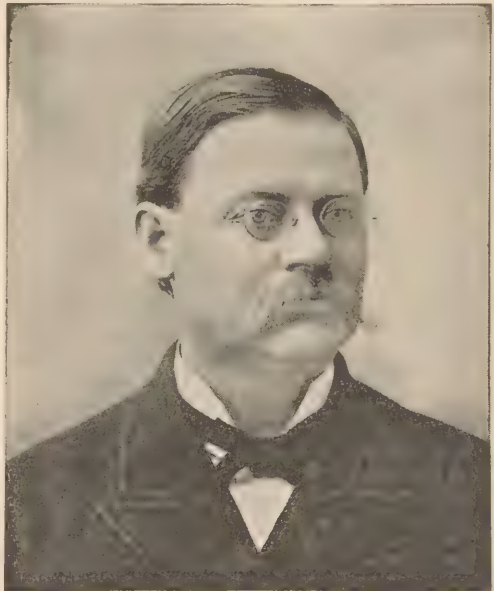

John P. Gray

years later became acting superintendent. In 1853, when the Michigan State asylum was projected, he was elected the medical superintendent and designed the plans for the new institute at Kalamazoo. In 1854 he resigned the position and became Medical Superintendent of the Utica Asylum and held this position until his death. During the thirty-five years that he served in charge of the insane he did much to better the condition of this unfortunate class in this country by improving modes of treatment, and in bringing insane paupers within the reach of hospitals. Dr. Gray also inaugurated in the various asylums of the United States a microscopical study of the brain. In 1858 he was appointed consulting manager of the State Asylum for Insane Criminals at Auburn, and acted as commissioner and adviser in establishing other asylums in New York. He has served as president of the Medical Society of the State of New York, and in 1876 of the Psychological Section of the International Medical Congress in Philadelphia, where he read a paper on "Mental Hygiene," was a member of the American Medical Association; of the Association of Medical Superintendents of American Institutes for the Insane, and of numerous other medical organizations. He was made Professor of Psychological Medicine and Jurisprudence in Bellevue Hospital Medical College in 1874, and in the Albany Medical College in 1876, and held these positions until 1882. His services as an expert on insanity were frequently employed in the courts, and he was regarded as good authority on all medical questions relating to life insurance. His management of the New York State Asylum gave that institution a wide reputation. His papers and reports relating to psychiatry were regarded as valuable contributions to science,

and his influence was felt in State legislation on the subject of insanity. He edited for many years the *American Journal of Insanity*, of which he took charge in 1854. He was much interested in all public charities, and was active in the establishment of orphan asylums, hospitals, and all societies for the relief of the destitute. In 1874 Hamilton gave him the degree of "Doctor of Laws" as a recognition of his pre-eminent medical attainments, and his professional merit also secured for him many other honors both here and abroad. His published addresses include, "Homicide in Insanity," 1857; "Thoughts on the Causation of Insanity," 1874; "Mental Hygiene," 1876; "Abstract of the Laws of New York relative to Insanity," 1878; "Heredity," 1884; and "Insanity and Some of its Preventable Causes," 1885. On March 16, 1882, he was shot by Henry Remshaw, a "lunatic", and never fully recovered from the effects of the wound. His death occurred while still in the height of his professional renown, and in one sense, he died a martyred victim to the cause in which his long and useful life had been devoted.

GREEN, George R., of Muncie, Ind., was born in Delaware county, that State, November 15, 1851. His father, Dr. A. J. Green, and mother, Massa (Johnson) Green, were of English-Irish descent. He was reared on a farm, and received his preliminary education at the Muncie High School. He began the study of medicine with his father, one of the self-made pioneer physicians of his native State, and graduated in medicine at the College of Physicians and Surgeons of Indiana, in 1877. The year following (1878), he was granted an ad eundem degree by the Medi-

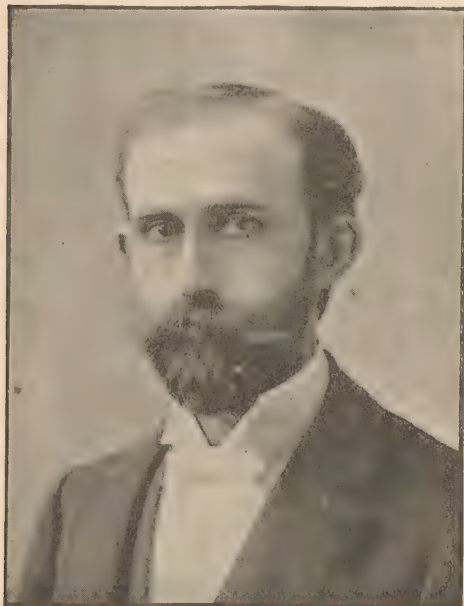

Geo. R. Green

cal College of Indiana. He was married July 20, 1878, to Miss Mary E. E. Monroe, of Muncie. During the course of his study at college he was selected from his class to be an assist-

ant to the demonstrator of anatomy, and graduated with high honors. Besides being a hard student, he has since his graduation supplemented his medical studies by a post-graduate course of instruction in the New York Polyclinic, and a course of private instruction in gynecology at the University of the City of New York. He has always practiced in his old home, in his native county, and for several years at Muncie, his time being devoted to the general practice of medicine and surgery. Dr. Green is an active member of the various local medical societies and the Indiana State Medical Society.

GREENFIELD, Charles Edward, of Chicago, Ill., was born on a farm near the little village of Brookston, Ind., December 5, 1859. His parents, Benjamin and Martha, are of English

C. E. Greenfield

and Scotch descent. Both father and mother were anxious that their son should follow in the footsteps of his father and become a farmer. But it had been young Greenfield's earliest and ever present desire to become a physician. Through the long hot days that he followed the plow, his book was his constant companion. And at the turn of the furrows out came the book for a few moments, and it was thus that he laid the foundation for the education that has been the pride of his parents and an honor to his profession. In the winter when he could be spared from the farm he was permitted to attend the district school, from which he graduated at the age of fifteen. He had made such remarkable progress and was so well versed in the elementary

studies, that before arriving at the required age he had determined to teach, and secured the license without the least effort and taught a country school three successful terms. At the age of nineteen he entered Wabash College, at Crawfordsville, Ind., and continued his studies there until he was offered the principalship of the public schools at Chalmers. There young Greenfield was so successful that he abandoned public school work, only to enter the medical profession, which was his ideal. But he had long since decided to sacrifice anything to attain the goal of his ambitions, which was a thorough knowledge of the science of medicine. As a preliminary training he entered a drug store at Logansport. His work in this position gave him an extensive knowledge of drugs. Nights he spent in hard study, and by the time he felt himself ready to enter medical college he had a knowledge of medicine which some consider sufficient to justify the beginning of practice. In 1883 Greenfield entered Rush Medical College and after diligent application he graduated in 1886. Dr. Greenfield immediately located in Chicago and began practice at once. Before the Doctor had been long in the field he found a help-mate was necessary, and on January 1, 1888, he was united in marriage to Miss Edla Davey. Mrs. Greenfield possesses all of those qualifications necessary to make a husband's life a success, and his home a delight. They have one child, Benjamin, Jr., a bright and interesting little boy two and a half years of age. Dr. Greenfield, pre-eminently a self-made man, with every discouragement in youth, had only his own perseverance and ability in assisting him to surmount the obstacles in his pathway. His success attests how well they have performed their work. His untiring energy and brilliant talents have won a place for him second to none of his age. His jovial and genial disposition have secured him hosts of friends. It is safe to say that no physician on the great West Side of Chicago has any larger practice than Dr. Greenfield. Nor is his fame confined to the West Side alone. He has been elected a member of the Faculty of the College of Physicians and Surgeons, which position he now holds as lecturer on Materia Medica and Therapeutics, and also clinical instructor of the eye and ear department of same college. He is a member of a number of secret societies, including some of the most prominent, as Masons, Odd Fellows, Knights of Pythias and several more. He was recently appointed by the commissioners of Cook county a member of the Board of Physicians for the county hospital. Dr. Greenfield has not reached the prime of life, and with all the recognition his attainments have received in the past, we can predict for him a still more brilliant future.

GRIFFITHS, Samuel Powell, was born in Philadelphia, Pa., July 21, 1759, and died there May 12, 1826. Having been classically educated at the College of Philadelphia, he studied medicine with Dr. Kuhn. He attended lectures during the troubled times of the Revolution, and graduated Bachelor of Medicine in the University of Pennsylvania, July 4, 1781. He then proceeded to Europe, but, on account of the war existing between Great Britain and the United Colonies, went first to France. After spending some time in attendance upon

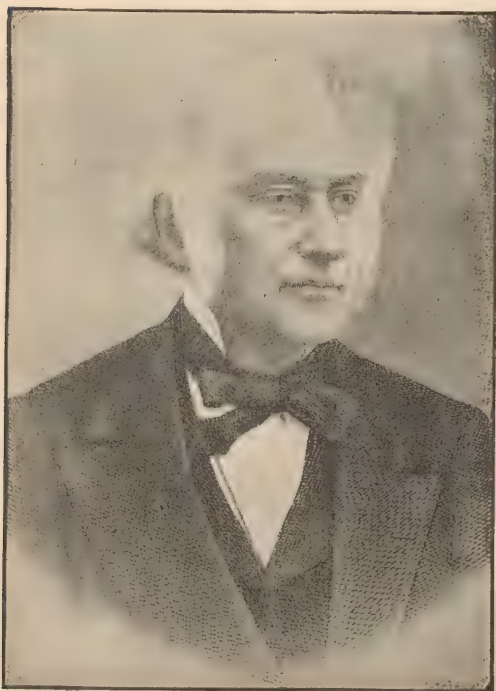

the lectures and hospitals of Paris, he went to Montpellier, where, in the winter of 1782-83, he attended a course of lectures. An attraction of this celebrated school at that time was the distinguished medical philosopher, Barthez. The following year was spent in London and at the Medical School of Edinburgh, when, after an absence of three years, he established himself in his native city. The first public enterprise in which he was engaged was the foundation of the charity which has operated so beneficially in relieving the miseries of the poor, known as the "Philadelphia Dispensary." This institution went into operation in 1786, and, either as one of its physicians or in the capacity of secretary of the board of managers, his services were given to it till the close of his useful life. From 1790 to 1796 he held the Chair of *Materia Medica* in the University of Pennsylvania, and throughout this period his lectures are said to have evinced great industry in the acquisition of useful materials, method and perspicuity in their arrangement, and zeal for the advancement of his class in solid information. But the situation of a public lecturer was not altogether congenial to his feelings, which were most gratified by an active discharge of the less conspicuous duties of life. Perhaps, too, the disinclination which he always manifested to hold any place of emolument may have exercised some influence in producing his resignation of a chair which was every year becoming more profitable, and even at that period conferred one of the highest honors within the reach of the profession. During the prevalence of yellow fever in his native city in 1793, and the epidemics of 1797, 1802 and 1805, he remained at his post, regardless of personal danger, and was of great service. From 1817 till his death, Dr. Griffiths was vice-president of the College of Physicians, and was also active in establishing, under the auspices of the Philadelphia Yearly Meeting of Friends, an institution for the relief of mentally deranged persons. In consequence of his early studies in connection with *materia medica* and pharmacy, Dr. Griffiths was deeply interested in the formation of a National Pharmacopœia. In June, 1788, he was placed on a committee of the College of Physicians to form a Pharmacopœia for the use of the college, but this undertaking was permitted to slumber until 1820, when the college united with other societies for the formation of our present national work. Dr. Griffiths served upon the committee then appointed, and for this duty his former experience well qualified him. At this time he read before a convention held in Washington for the formation of a Pharmacopœia an essay on this subject, of which he was the principal author.

GRÖNER, F. J., of Grand Rapids, Mich., was born in Richmond, Pa., August 8, 1849. His parents moved to Michigan when he was five years old. He was brought up on a farm, and had very little advantage of the country schools of those days. He received the degree of B. S. from the Michigan State Agricultural College in 1874. He began the study of medicine in the office of Wm. Ikeler in Three Rivers in 1887, and graduated from the University of Michigan, Ann Arbor, in 1880. He took post-graduate studies in New York City in 1883. He located in Big Rapids, Mich., in 1880, and was surgeon to Mercy Hospital for

ten years. He treated over seven thousand patients in the hospital, a large number of them being surgical cases, as the hospital was for the benefit of men working in the lumber woods. Dr. Gröner was one of the first to introduce aseptic and antiseptic surgery in Michigan. He moved to Grand Rapids, Mich., in 1890. He is visiting surgeon to the U. B. A. Hospital, and consulting surgeon to St. Mary's Hospital. He is a member of the Grand Rapids Academy of Medicine, Michigan State Medical Society and American Medical Association. He is a frequent contributor to medical literature, especially on surgical subjects. His papers on "Surgical Treatment of Empyema," "Operation for Spina Bifida," and "The Causes and the Remedies for Suits for Malpractice," have been largely quoted.

GROSS, Samuel David, of Philadelphia, was born near Easton, Pa., July 8, 1805, and died May 6, 1884. After a classical education at the Wilkesbarre Academy and the high school, Lawrenceville, N. J., he studied medicine with Dr. Joseph K. Swift, of Easton; subsequently he was for nearly two years a private student under Prof. George McClellan. He graduated from the Jefferson Medical College in 1828, and began practice in Philadelphia, employing his leisure hours in close study, and in translating several standard French and German medical works, which were published. In 1830 he issued his first original work, "Diseases and Injuries of the Bones and Joints," in which particular mention is made of the use of adhesive plaster as a means of extension in the treatment of fractures, now so generally employed by surgeons of this and other countries. During the same year he returned to Easton. Dr. Gross made many original contributions to surgery. In early life he made experiments on rabbits, with a view to throwing light on manual strangulation, which are described in Beck's Medical Jurisprudence. He was the first to suggest the suturing of divided nerves and tendons, wiring the ends of bones in certain dislocations, laparotomy in rupture of the bladder, and many other operations, and was the inventor of numerous instruments, including a tourniquet, an instrument for extracting foreign bodies from the ear or nose, and an apparatus for the transfusion of blood. His original investigations were varied, though often carried on with insufficient means and amidst adverse surroundings. In 1833 he became Demonstrator of Anatomy in the Medical College of Ohio, at Cincinnati, and two years later Professor of Pathological Anatomy in the medical department of the Cincinnati College. Here he delivered the first systematic course of lectures on morbid anatomy ever given in the United States, and, while thus occupied, composed his "Elements of Pathological Anatomy," the first methodical treatise on the subject ever published on this side of the Atlantic or in the English language. After four years he accepted the Chair of Surgery in the University of Louisville. For ten years he labored in this lecture room, and then, in 1850, resigned to accept a similar professorship in the University of New York, just vacant by the retirement of the venerable Dr. Mott. At the end of the first session he withdrew, and, at the earnest solicitation of his former colleagues, returned to his Louisville chair. In 1856 he was elected Professor of Surgery in the Jefferson Medical College,

Philadelphia, and filled that chair until within two years of his death, when he resigned on account of advancing years and a desire for repose. Dr. Gross was a very voluminous author. In addition to the works already named, he has, among others, written his "System of Surgery," upon which his posthumous fame will most probably mainly depend; it appeared in 1859, has passed through six editions, the last, issued in 1882, being thoroughly revised and brought up to the existing state of the science, and is comprised in two large volumes, illustrated by upwards of 1,400 engravings. It was translated into the Dutch language, and published at Nieuwediep, 1863, and is considered the most elaborate and ex-

S. D. Gross

haustive work on surgery ever written by one man. He edited a large work on "American Medical Biography," 1861; was one of the founders and chief editors of the *North American Medico-Chirurgical Review* (suspended at the outbreak of the war after a successful career of five years), and was the author of numerous addresses on medicine, surgery and biography, also of a "History of American Medical Literature," and of a "History of the Progress of American Surgery During the Last Century." He was a member of the American Philosophical Society; of numerous medical societies in the United States; of the Imperial Medical Society in Vienna; Medical Society of Christiana, in Norway; Royal Medical and Chirurgical Society, of London; Medico-Chirurgical Society of Edinburgh; Medical Society of London, and British Medical Associa-

tion, to which, on two occasions, he was an accredited delegate. He was one of the founders and early presidents of the Kentucky State Medical Society. While in Louisville he published an elaborate and exhaustive "Report on Kentucky Surgery," in which he first established the fact that the late Dr. Ephraim McDowell, of Danville, in that State, was justly entitled to the honor of being the father of ovariectomy, until then erroneously ascribed to other surgeons. Shortly after settling in Philadelphia, he founded, in conjunction with Dr. Da Costa, the Philadelphia Pathological Society, of which he was the first president and which now embraces a membership of nearly one hundred and fifty. In 1867 he was elected president of the American Medical Association, and in April, 1870, presided at the Teachers' Medical Convention, held in Washington, to consider the subject of medical education. June, 1870, he was chosen president of the Pennsylvania State Medical Society. In 1872, during his second visit to Europe, the University of Oxford, at its one-thousandth commemoration, conferred on him the honorary degree of D. C. L., and that of LL. D. was given him by the University of Cambridge. He was unanimously elected president of the International Medical Congress which met in Philadelphia in September, 1876. Dr. Gross was always a warm and decided advocate of professional progress and of a higher standard of medical education. Systematic and economical of time, he had, while punctually fulfilling all engagements as professor and practitioner, been enabled to maintain his early habits of earnest study, to keep thoroughly informed in medical and general literature, and to become a voluminous author. It is said that large portions of his literary work were composed while riding about the city in his daily professional routine. Dr. Gross was a skillful operator and a teacher of general surgery for forty years, during which time he was recognized as the greatest American representative of this branch of the profession. His published works were adopted as standard authority, not only in the army, navy and in the civil practice of our own country, but were regarded as of the highest value by other leading nations of the world.

GUICE, Napoleon Lorenzo, of Meridian, Miss., was born in Franklin county, that State, February 10, 1838. His early education was acquired in the country schools and was finished in the classics under a teacher of local distinction, and in 1867-68 he studied the French language under a Parisian teacher. He was graduated from the medical department of the University of Louisiana (New Orleans) in 1858. His medical education was supplemented by attending three supernumerary courses at his *alma mater* and by a three months' course at the New York Polyclinic. Dr. Guice first located in a wealthy (planting) community of Jefferson county, Miss., in 1858, whence he removed in 1866 to the town of Fayette, in the same county. In 1886 he removed to Natchez, and in 1893 to his present home. He was married first, in 1881, to Florence, daughter of Col. Chas. Pugh of West Point, Miss., and again in 1890 to Annie, daughter of Geo. B. Neal, of Parkersburg, West Va. He has ever been a close student, not alone of medicine, but also of the

collateral sciences, and has accumulated one of the finest scientific libraries in his State. In 1887 he made, upon the human subject, in the early months of pregnancy, experiments with a view to test the abortifacient (oxytocic) powers of ergot and other drugs of its class, the same being duly reported and published. About the same period he experimented with veratrum viride given hypodermically in puerperal eclampsia, and published two papers on the subject showing brilliant results. He also published some original experiments with electricity as an oxytocic and contributed many additional papers to current medical literature. He was one of the originators of the Mississippi State Board of Health

Napoleon L. Guice.

and of the law regulating the practice of medicine in his State. He has been a member of numerous medical societies, was president of the Mississippi State Medical Association in 1887-88, and is now president of the Adams County Medical Society. From 1875 to 1885 he took an active interest in the politics of his State, and has ever been prominent in (local) humane work. He has made many capital surgical operations, one of which being the first laparotomy made at Natchez.

GUITERAS, John, of Philadelphia, Pa., was born in Mantanzas, Cuba, and is of Spanish descent. He received his preliminary education in his native city, and then studied medicine under the preceptorship of Drs. Pepper, Wood, Allen and Tyson, of Philadelphia, Pa., and was graduated M. D. in 1883, at the University of Pennsylvania, and obtained the first prize (\$100) for his thesis. His medical education was supplemented as resident in the Philadelphia Hospital. He practiced his profession seven years in Philadelphia, four years in Key West, Fla., and four years in Charleston, S. C., being in government service. During this time he practiced general

medicine, but lately has done only pathological work. He has devoted much time to the study of languages. Dr. Guitéras has had marked success in the diagnosis and treatment of yellow fever. He served in 1887 and 1888 in the Florida epidemics of this malady. He has made extensive reports on yellow fever in the "Bulletins of the National Board of Health" and the "Annual Reports of the Marine Hospital Service." He has contributed descriptions of the continued thermic fever of warm countries. He is credited with the discovery of the filaria sanguinis hominis, in Charleston, S. C., April, 1886. He was a member of the Havana yellow fever commission of the National Board of Health, in 1879. He entered the Marine Hospital service in 1880. He was appointed Professor of Practice in the Medical College of South Carolina, in 1886, and resigned in 1888, to take the chair of Pathology in the University of Pennsylvania, and was sent by the university, in 1889, to study the Koch method of the treatment of tuberculosis.

GUTHRIE, William E., of Bloomington, Ill., was born in Abingdon, Ill., July 26, 1857, of Scotch-German parents. At the age of fourteen he entered the Illinois Wesleyan University, where he continued four years. Two years were then spent in teaching school. When near twenty years old he commenced the study of medicine under the preceptorship of Dr. J. L. White, of Bloomington, and four years later graduated from Rush Medical College. He was immediately taken into partnership by his preceptor, and such union continued until January 1, 1892, when the partnership was dissolved. In 1888 Dr. Guthrie went to Europe and there remained one year, spending most of the time in Berlin. From 1883 until his visit abroad he held the position of county physician. Since 1885 he has been district surgeon of the Lake Erie and Western Railroad. The Doctor is a member of the McLean County Medical Society, the Illinois State Medical Society, the American Medical Association, and the National Association of Railroad Surgeons. He is an examiner for most of the "old line" insurance companies.

HADRA, Berthold Ernest, of Galveston, Tex., was born in Prussia, in 1842. After the usual course in classics, he studied medicine in the Universities of Breslau and Berlin, from which latter he graduated in 1866. Having passed his State examination, he served in the army as assistant surgeon until he emigrated to the United States, in 1869. He practiced in San Antonio and Austin, Tex., until he was called to the chair of Surgery in the Texas Medical College, at Galveston, in 1889. After the discontinuation of this school, he remained there, doing a general practice. His contributions to current medical literature are quite numerous. The more important ones are: "De Diabete Insipido," thesis, 1866, an often quoted essay; "Injuries of the Pelvic Diaphragm," *American Journal of Obstetrics*, 1884; "Traction on the Womb," "Intraperitoneal Adhesions in Relation to Tait's Operations," read before the American Medical Association, 1885; "Two Cases of Congenital Tarticollis," advocating as the first operation by forced incision, *New York Medical Record*, 1886; "Open Treatment of the Abdominal Cavity," read before the Southern Surgeon and Gynecological Association, 1889; "Lesions of Vagina

B. E. Haina

and the Pelvic-floor," 1888; "Some Reflections on Morning Sickness," *Times and Register*, 1890; "Wiring of the Vertebrae as a Means of Immobilization in Fracture and Potts' Disease," read before the meeting of the Texas State Medical Association, *Times and Register*, 1891, and "Omental Tumors," *Annals of Surgery*, 1891.

HAINES, William Joseph, of West Farmington, Ohio, was born in North Bloomfield, that State, January 11, 1837. Besides a limited common school education, he attended the Western Reserve Seminary, West Farmington, also for a short time Mount Union College, Ohio. Before being able to finish his education, which he greatly desired to do, he enlisted as a private soldier, August 7, 1862, in the 105th Regiment Ohio Volunteers. He was promoted to first lieutenant, served also as captain, and honorably retired from the army service in the spring of 1865. Having paid some attention to medicine before enlisting, when necessity required it, he assisted the army surgeons in caring for the sick and wounded soldiers in the field and hospitals. Beginning in the summer of 1865, he continued the study of medicine until he graduated at the College of Physicians and Surgeons, New York, in March, 1869. He commenced practice, remaining one year at the Cliff (copper) mine, near Lake Superior; afterward he was employed as surgeon for four years by the Jackson Iron Co., at Fayette, Upper Peninsula of Michigan. Five years were spent in New York State, and the balance of the time he has been engaged in practice in Trumbull county, Ohio. Desiring to add to his stock of medical knowledge he spent about eight months, in 1876-77 in Philadelphia and New York. Dr. Haine is a country practitioner, which usually means a general practitioner. But are not country

practitioners, very many of them, physicians of a high order? What physicians are more cool in judgment, keen to discriminate, wise in the use of expedients, more ready for all emergencies, or called upon to treat more dangerous cases? In the most critical times they must often stand by alone and save their patients, if they are saved at all. Perhaps the humble country doctor is too often looked down upon as an inferior. But if the truth is told, are there not thousands of country physicians who are as truly and nobly filling their places as any of their highly favored city brethren, who may be medical authors, editors, professors or specialists. Give only due credit and honor to the country practitioners, very many of whom are making the best use of their limited advantages, are courageous, self-sacrificing, and are bending their energies untiringly in their labor of love to save life. These "unsung heroes," God's noblemen, are not few, who never sought applause nor fame, and whose work will be unrewarded in this world, save by the consciousness that they have faithfully endeavored to do their duty.

HAINES, Walter S., of Chicago, Ill., was born there September 27, 1850, and is a lineal descendant of John Haines, first governor of the colony of Connecticut. Dr. Haines was educated at the Chicago High School, and at the Massachusetts Institute of Technology, Boston. He studied medicine in the Chicago Medical College, and graduated in the spring of 1873. He also spent fifteen months in study in Europe. He settled in practice in Chicago, where he is devoting his attention exclusively to chemistry, toxicology, and other branches of medical chemistry. He is a member of the Chicago Chemical Society, and of the American Public Health Association; and has contributed a few articles on medical chemistry to the journals. He was appointed Professor of Chemistry in the Chicago Medical College in 1873, which position was held till the summer of 1876, when it was resigned to accept the like chair in the Rush Medical College.

HALE, George Varnum, of Wheatland, Tex., son of James Monroe Hale and Fannie (Fletcher) Hale, was born in Belmont, Mass., May 2, 1858. He was educated at the University of Chicago; graduated LL. B. from the law department of same, 1878. He attended lectures at University of Michigan in 1879, at University of Virginia, 1881, and graduated M. D. at Jefferson Medical College, Philadelphia, April, 1883, receiving the surgical prize offered by Professors S. W. Gross and John H. Brinton for a thesis on "A New Apparatus for Fractured Clavicle." Failing health caused him to leave Illinois, the State of his adoption, and he settled in Wheatland, Dallas county, Tex. He married, in 1886, Lucie E., youngest daughter of Hon. H. K. Brotherton, of Dallas, and is at present doing a large country practice at Wheatland, Tex.

HALE, Samuel Echols, of New Orleans, La., was born at Athens, Ga., May 24, 1839. He descended from a distinguished English family of which Lord Chief-Justice Sir Matthew Hale was an illustrious member. His mother was of German descent. At an early age his parents became financially embarrassed and were unable to give him a liberal education. At the age of sixteen he obtained the consent of his parents to undertake the task of educating himself, and for this purpose left home—without

a dollar. He entered an academy and maintained himself there by laboring on a farm, when out of school. Later he took the course in Cleveland Collegiate Institute of Georgia. In 1861 he was teaching in Mississippi, preparatory to taking his university course. He was correspondent of several papers, and wrote extensively for literary journals. On the breaking out of the Civil War, sharing the convictions of the South, he volunteered as private soldier in the Eighth Mississippi Regiment. At the battle of Stone River, Tenn., he was dangerously wounded and was not able to join his regiment again. In 1863 he was appointed assessor of the war tax in Mississippi. He graduated in medicine at the University of Louisville, in 1872. He went to New Orleans and began the practice of his profession. The following year he married Miss Alice C., daughter of R. W. Rague. In 1874 he was appointed resident physician at the great sani-

A. C. Hale

tarium, Hot Springs, N. C. Late in the same year he went to London to continue his studies there. He studied gynecology with Robert Barnes and Sir Spencer Wells. Took a course in obstetrics in Rotunda Lying-in Hospital, Dublin. He returned to New Orleans in 1876. Was elected visiting physician to the Charity Hospital, and house physician to Fink Asylum. Became a member of the Orleans Parish Medical Association, the New Orleans Medical and Surgical Society, the American Public Health Association and the New Orleans Academy of Science. In 1877 he published descriptions of his successful treatment of Trismus Nascentium, and Traumatic Tetanus, by chloral hydrate; also, of his modified method of treating Fistula in Ano, by elastic ligature. He treated over three hundred yel-

low fever patients, in the great epidemic of 1878, with a loss, by death, of six per cent. only. In 1881, the ill health of his wife caused Dr. Hale to leave his practice, spending six years in travel, and in residence at various health resorts, hoping to restore her to health. In 1889 he was commissioned Surgeon-General of the Uniformed Rank K. of H., of the United States and Canada, with the rank of Brigadier-General. During the same year he was elected editor of the *Uniformed Rank Argus*.

HALL, William Asbury, of Minneapolis, Minn., was born at Aurelius, N. Y., June 17, 1853. He is a descendant of the Fairfield branch of the Halls, of New England, who emigrated from England to this country in 1639; a family of Revolutionary fame and noted for its learning and ability. He received an academic education at Auburn, N. Y., and received a certificate of academic scholarship from the regents of the University of the State of New York, at the age of fourteen. He afterwards taught mathematics and the natural sciences until 1872, when he commenced the study of medicine with Dr. A. S. Cummings, of Cayuga, N. Y. He graduated at the Albany Medical College, December 23, 1875, receiving the special obstetrical prize and an honorable mention for his thesis and general proficiency. Immediately after graduation he secured, by competitive examination, the position of Senior Resident Physician and Surgeon to Albany Hospital, and remained there until 1877, when he located at Fulton, N. Y., and soon obtained a very large general practice. In 1880 he married Miss Ida A. Dickinson, of Lowville, N. Y. He remained at Fulton until 1887, when he removed to Minneapolis, in order to devote more attention to surgical work. During the same year he was elected Professor of Medical Jurisprudence in the Minnesota Hospital Medical College, and also Attending Surgeon to St. Mary's and St. Barnabas' Hospitals. He now holds the chair of Principles of Surgery and Clinical Surgery in the Minneapolis College of Physicians and Surgeons. He is recognized by the profession as a brilliant operator and one of the ablest medical experts in the Northwest. He is a member of the various national, State and local medical societies, and is at present the president of the Hennepin County Medical Society.

HAMILTON, Allan McLane, of New York, was born in Brooklyn, N. Y., October 6, 1848. He is the son of Philip Hamilton, youngest son of Alexander Hamilton; and on his mother's side the grandson of Louis McLane, secretary of State in President Jackson's cabinet. He graduated in 1870 at the College of Physicians and Surgeons, New York, in which city he settled and has since resided. At his graduation he received the first faculty prize, the subject of his thesis having been, "Galvanopuncture;" receiving also the Harsen prize medal. He devised, in 1874, a new dynamometer, described in the *Psychological Journal* and *Medico-Legal Journal* for April, 1874; was one of the first practitioners to use galvanocautery in this country, and the first to use monobromate of camphor in delirium tremens, and nitro glycerine in epilepsy. In the trial of President Garfield's assassin he testified as an expert in behalf of the government. His specialty is nervous diseases. He is a member of the New York Academy of Medicine,

of which he was statistical secretary in 1874; of the Society of Neurology, of which he was secretary in 1875; and of the County Medical Society, and a delegate to the State Medical Society in 1877. He is the author of a work on "Clinical Electro-Therapeutics," published in 1873; a text-book on "Nervous Disease," 1878-81; and on "Medical Jurisprudence," 1887; and of articles on "Epilepsy," on "Genital Irritation as a Cause of Nervous Diseases," and "Tremors and Incoördination." He was formerly editor of the *American Psychological Journal*. He is visiting surgeon to the Epileptic and Paralytic Hospital on Blackwell's island, and was recently physician in charge of the New York State Hospital for diseases of the nervous system, and lecturer upon nervous diseases at the Long Island College Hospital, attending physician to New York Hospital for Nervous Diseases, consulting physician to New York City Insane and Idiotic Asylum; New York Asylum for Ruptured and Crippled; and Hudson River State Hospital for Insane; Fellow of the New York Academy of Medicine; New York Neurological Society; and president of Cumberland Gap Park Company.

HAMILTON, Frank Hastings, of New York, was born in Wilmington, Vt., September 10, 1813, and died in the former city August 11, 1886. He graduated from the medical department of the University of Pennsylvania in 1835, and settled first in Auburn, N. Y., removing in 1844 to Buffalo, and thence to New York City in 1862. He has labored most in surgery, in which his notable operations have been too numerous for separate mention here, and to the science and art of which he has made very important contributions. He has invented a "bone drill," and an apparatus for broken jaw, has devised or modified the apparatus for almost every fracture of long bones, also various instruments in military and general surgery, including the compound Nelaton's probe, light bullet forceps, strong bullet forceps, movable apparatus for fractures of thigh, bone forceps, serrated giant bone-cutter, the modified Liston's artery forceps, apparatus for double varus, hare-lip scissors, modification of Owen's tonsillotomy, and a method of manipulating the body in asphyxia from drowning, besides modifying and rendering more precise the methods of amputation through the joints, by furnishing what he has termed "keys" and "guides" to the articulations, one of his most valuable contributions to surgery. He has been especially instrumental in introducing gutta percha as a splint where irregular joint surfaces require support, and was the first to employ gutta percha as an "interdental splint," as he was the first to make the operation of resection for simple talipes where there was no disease of the joint, and the first also to cut away the central portion of the thyroid gland, an operation subsequently performed by Gibb, of London. He likewise suggested and practiced a safe method of cutting the sternal portion of the sterno-cleido-mastoid. On the subject of "Provisional Callus" he publicly controverted the views of Dupuytren, propounding doctrines which were original with him—although without his knowledge Paget had in fact advocated similar ones a short time before—and which are now generally accepted. In relation to "Resection in Compound Dislocations of Long Bones," he, in 1860 or there-

abouts, announced views which are now received by Langenbeck and most German surgeons; and in the matter of closing old ulcers by the transplantation of new skin, both the English and the French surgeons have repeatedly ascribed to him the honor of having taken the first step. He devoted a good deal of attention to plastic surgery, having practiced rhinoplasty twenty or more times, and introduced a method of operating from the forehead by returning the pedicle, and having been, moreover, the first to operate from the palm of the hand. He labored strenuously to impress upon surgeons the value of warm and hot water in the treatment of wounds, and in general was not less effective in urging new methods than fertile in devising them. He was a member of the New York State Medical Society, of which he was president in 1855; of the New York Pathological Society, of which he was president in 1866; of the New York Academy of Medicine; of the Medico-Legal Society, of which he was president in 1875; also of the American Academy of Medicine in 1878, and of the New York Society of Medical Jurisprudence in 1885, and an honorary member of various other societies. He published a treatise on "Military Surgery;" a treatise on "Fractures and Dislocations," which has been translated into German at Göttingen, and a "General Treatise on Surgery," not to mention various other publications, comprising some valuable papers touching medical jurisprudence, especially one on "Prognosis in Fractures," published in the Transactions of the American Medical Association from 1855 to 1857, and in those of the New York State Medical Society for 1855 and 1859, and one on the "Effect of a Sudden Loss of Consciousness on the Memory of Preceding Events," 1876. He was medical inspector in the United States Army in 1863. In 1875 he resigned the Professorship of Surgery in the Bellevue Medical College, but retained the position of Visiting Surgeon to the Bellevue Hospital until his death. He was also consulting surgeon to other hospitals and to various city dispensaries, and in that capacity had few equals. On the assassination of President Garfield he was called in consultation, and remained associated with the case until the death of the President.

HAMILTON, John B., of Chicago, was born in Jersey county, Illinois, December 1, 1847; was educated at Hamilton Grammar School, and was graduated M. D. at Rush Medical College, February, 1869. He was married in 1871, to Miss Mary L. Frost, and they have had two children. He engaged in general practice from March, 1869, until 1874, when he was appointed assistant surgeon and first-lieutenant United States Army, and served at St. Louis barracks and in the Department of the Columbia, at Fort Colville, Wash., where he resigned, in 1876. In September, 1876, he entered the United States marine hospital service as an assistant surgeon, and served in New York City. He was then ordered to Boston, and in June, 1877, was promoted to be a surgeon. In April, 1879, he was promoted to be supervising surgeon-general to succeed Gen. John M. Woodworth, who died March 10, 1879. General Hamilton immediately began the reorganization of the service, and Congress finally passed a law placing the corps upon practically the same footing as the medical corps of the army and navy. During his incumbency

of the office he succeeded in having the national quarantine acts passed, and successfully managed the campaign against two epidemics of yellow fever. He received the thanks of the Legislature of Florida for services during the epidemic in December, 1889. In June, 1891, the House of Representatives having, for the second time, failed to pass the Senate bill providing for the equalization of the salary of the office with that of the surgeon-general of the army and the surgeon-general of the navy, he resigned his commission of surgeon-general, and once more came into the ranks of medical officers as a surgeon. Outside his official life, he was Professor of Surgery in the University of Georgetown (from which institution he received the degree of Doctor of Laws, in 1888), and Surgeon to Providence Hospital. On returning to Chicago, he was made Professor of the Principles of Surgery and Clinical Surgery in Rush Medical College, Surgeon to the Presbyterian Hospital, and Professor of Surgery in the Chicago Polyclinic, consulting Surgeon to St. Joseph's Hospital and to the Central Free Dispensary. In 1887 he was the secretary-general of the Ninth International Medical Congress, held in Washington, and in 1890 he was a delegate from our government to the International Medical Congress, held in Berlin, and there made the response on behalf of the American delegates to the address of welcome. Professor Hamilton holds a weekly surgical clinic at Rush Medical College, and one at the Polyclinic. He is author of various articles in the medical journals, and of "Lessons on Longevity" and "Lectures on Tumors," and is the American editor of "Moullin's Surgery," published in 1893. Dr. Hamilton has given personal supervision to the management of sanitary and quarantine measures against the spread of infectious and epidemic diseases. He founded "Camp Perry" in Florida, in the yellow fever epidemic of 1888, and in 1892 founded "Camp Low," on Sandy Hook, N. J., as a refuge cholera camp, for the overflow from New York quarantine. In 1893 he was elected editor of the *Journal of the American Medical Association*, and Executive President of the Section on General Surgery, Pan-American Medical Congress, delivered an address on "General Surgery," and subsequently wrote an editorial of great interest for the *Journal* on the "Future Great University," and the establishment of such an institution in this country, suggested by this assembly of physicians of the Western Hemisphere.

HAMMOND, William Alexander, of Washington, D. C., son of Dr. J. W. Hammond and Sarah (Pinckney) Hammond, both descendants of old Maryland families, was born in Annapolis, Md., August 28, 1828. He received his academic education at Harrisburg, and pursued his medical studies at the University of New York, whence he graduated M. D. in March, 1848. In July, 1849, he married Helen, daughter of the late Michael Nisbet, Esq., of Philadelphia. He resided in Philadelphia one year after graduating, during which he was in attendance at the Pennsylvania Hospital; subsequently at Saco, Me.; and after six months entered the United States army as assistant surgeon. Here he remained eleven years, and then in the autumn of 1859 accepted the appointment of Professor of Anatomy and Physiology in the University of Maryland, at Baltimore. As surgeon of the Baltimore infirm-

ary he attended the wounded men of the Sixth Massachusetts Regiment, who were fired on by the mob of Baltimore while passing through the city to the defense of Washington. He subsequently resigned his professorship, and re-entered the army as assistant surgeon, in the spring of 1860 (he having lost his rank acquired by previous service), and was attached to General Patterson's headquarters, at Chambersburg and Frederick as medical purveyor. He subsequently organized the Camden Street Hospital, in Baltimore, of which he remained in charge for several months, and was assigned to duty in the department of West Virginia, then under command of General Rosecrans, by whom he was appointed medical inspector of camps and hospitals. In the spring of 1852, at the urgent request of the sanitary commission, and by the advice of General McClellan, he was appointed Surgeon-General of the army

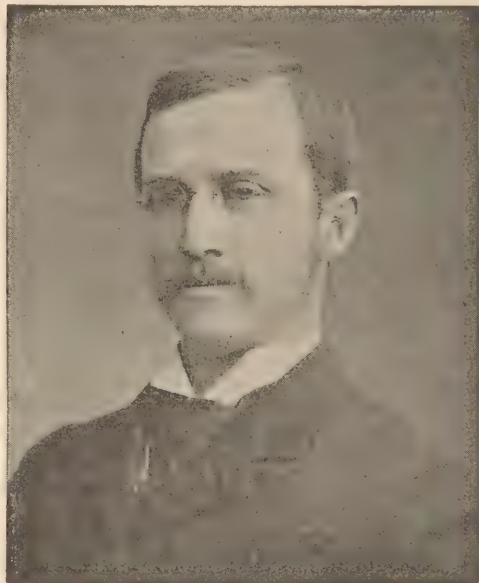

William A. Hammond.

of the United States, with the rank of Brigadier-General. From inexperience, the hospital systems which had prevailed in the old army were useless, and from his former connection with the army, and his perfect familiarity with foreign military systems, this branch of the service was from the beginning of his administration made the great object of his attention; and he succeeded, in the face of serious obstacles, in inaugurating a hospital system which was alike creditable to the country and to the age, the sick and wounded being better cared for in every respect in our military hospitals than ever before, and the rate of mortality in them being "far lower than had been observed in the experience of any army since the world began." He was also the originator of the Army Medical Museum, which he established by a special order, and of the "Medical and Surgical History of the Rebellion," the whole plan of which was laid down in circulars, addressed to the medical corps, during the first year of his administration. During the whole of his service as Surgeon-General, his personal and official

relations with the Secretary of War were unfortunately, for the good of the army, of an unpleasant character. It would be improper in this place to enter into the discussion of all the causes which led to Dr. Hammond's removal from office, but charges of irregularities in the award of contracts for hospital supplies were made against him, and he was tried by court martial and dismissed from the army in 1864. He at once removed to New York, where he established himself in the practice of his profession and made a specialty of diseases of the nervous system. In 1878 a bill was submitted to Congress authorizing the president to review the proceedings of the court martial and if justice demanded, to reinstate Dr. Hammond. This measure was passed by the House unanimously, and by the Senate with but one dissenting vote. In August, 1879, it was approved by the President, and Dr. Hammond, after a full investigation into all the facts of the case, was restored to his place on the rolls of the army as surgeon-general and brigadier-general on the retired list. In 1888 he removed to Washington City, where he gives attention to his specialty. Soon after settling in New York, Dr. Hammond was appointed lecturer on diseases of the mind and nervous systems in the College of Physicians and Surgeons of that city. He resigned this after a short while to accept the professorship of the same branches in the Bellevue Hospital Medical College (the chair having been created for him). In 1874 he also resigned this and accepted a like professorship in the medical department of the University of the City of New York. He was also Professor of Diseases of the Mind and Nervous System in the University of Vermont at Burlington, a position requiring his attendance a short time in the summer. His contributions to medical literature are as follows: "Physiological Memoirs," "A Treatise on Hygiene, with Special Reference to the Military Service," 1863; "Lectures on Venereal Diseases," 1864; "On Wakefulness, with an Introductory Chapter on the Physiology of Sleep," 1865; "On Sleep and its Derangements," 1869; "Insanity and its Medico-Legal Relations," 1866; "A Treatise on the Diseases of the Nervous System," which has been translated into French and Italian, (1871—sixth edition, 1876); "The Physics and Physiology of Spiritualism," 1870; "Clinical Lectures on Diseases of the Nervous System," 1874; "Insanity in its Relations to Crime," 1873; "Spiritualism and Allied Causes and Conditions of Nervous Derangement," 1876; treatise on "Insanity in its Medical Relations," 1883. Dr. Hammond is also the author of various novels, including "Robert Severne; his Friends and Enemies," 1867; "Lal," "Dr. Grattan," 1884; "Mr. Oldmixon," 1885; "A Strong Minded Woman, or Two Years After," 1886; and "On the Susquehanna," 1887. In addition he has contributed to the medical journals and to the transactions of the medical societies with which he is connected, a large number of essays and memoirs on physiological, psychological, and neurological subjects. He was also editor and originator of the *Maryland and Virginia Medical Journal*, published at Baltimore; one of the editors and originators of the *New York Medical Journal*; and editor and originator of the *Quarterly Journal of Psychological Medicine and Medical*

Jurisprudence. He is Fellow of the College of Physicians and member of the Pathological Society, of the Academy of Natural Sciences, and of the American Philosophical Society of Philadelphia; of the New York County Medical, Neurological, and Medico-Legal Societies; of the New York Medical Library and Journal Association; of the American Neurological and Anthropological Associations; of the American Geographical Society; Fellow of the American Academy of Arts and Sciences, Boston; honorary corresponding member of the British Medical Association; honorary member of St. Andrew's Medical Graduates' Association, Scotland; corresponding member of the Anthropological Institute of Great Britain and Ireland; foreign member of the Medico-Chirurgical Society of Edinburgh; member of the Verein Fur Gemeinschaftlichen, Heilkunde, Germany; of the Verein Wurttembergischer, Wundarzte, und Gebrutshelfer, Germany; and of the Provencaal Utrechtsche Genootshaf van Kunsten en Wetenschappen, Holland.

H. A. Amory

HARE, Hobart Amory, of Philadelphia, Pa., was born and educated in that city. His distinguished medical preceptors were the late Dr. D. Hayes Agnew and Dr. H. R. Wharton. He graduated from the University of Pennsylvania in 1884, and received the faculty prize for his thesis on "The Action of Quinine on the Blood." In 1885 he won the Fiske Fund prize of the Rhode Island Medical Society for an essay on the "Physiological Effects of Tobacco," and again in 1886 for an essay on "New and Altered Forms of Disease Due to the Advance of Civilization in the Last Half Century." In 1887 he received honorable mention for his essay on "Antipyrine, Antifebrine, Salicylic Acid and Carbolic Acid," from the Cartwright Prize Committee of the College of Physicians and Surgeons, New

York. In 1888 the Fothergillian Medal of the Medical Society of London was awarded to an essay by Dr. Hare on the "Pathology, Clinical History and Diagnosis of Affections of the Mediastinum Other than Those of the Heart and Aorta." In 1889 the Cartwright Prize of the College of Physicians and Surgeons, of New York, and the Warren Triennial Prize of the Massachusetts General Hospital were awarded to Dr. Hare and Dr. Edward Martin, for an essay on "The Nervous and Mechanical Government of Respiration." In 1890 the Boylston Prize of Harvard University was awarded to Dr. Hare for his essay on the "Uses and Values of Antipyretics," and in the same year the Royal Academy of Medicine in Belgium divided its prize of 8,000 francs between Dr. Hare and Dr. Christian, of Charenton, France, for their essays on the "Pathology, Symptomatology and Treatment of Epilepsy." In 1890 the Fiske Fund Prize of the Rhode Island Medical Society was awarded for a third time to Dr. Hare, who, with Dr. Martin, wrote the successful essay on "Wounds and Obstruction of the Intestines." In addition to these essays Dr. Hare is the author of a "Text-book of Practical Therapeutics," which has already passed through two editions. He has also edited a "System of Therapeutics" in three volumes of 1,000 pages each, published by Lee Brothers, of Philadelphia. For a time Dr. Hare edited the *University Medical Magazine*, and for two years was editor of the *Medical News*. He is now editor of the *Therapeutic Gazette*. After having been Demonstrator of Therapeutics at the University of Pennsylvania for a number of years, he was elected, in the spring of 1890, Clinical Professor of Diseases of Children in that institution, and, in the following spring, Professor of Therapeutics and Materia Medica in the Jefferson Medical College, a position he still occupies. Dr. Hare is also at present one of the visiting physicians to St. Agnes Hospital, to the Jefferson College Hospital and to the Medical Clinic of the Children's Hospital. In 1886 he studied in Leipzig and Berne, and in 1888 in London. The subject of this sketch is a member of the Association of American Physicians, of the American Society of Nationalists, of the American Physiological Society, and of the College of Physicians, of Philadelphia, in addition to several local societies devoted to medicine in his native city. Dr. Hare has been a frequent contributor to the medical journals, detailing in his articles the results of original experimental or clinical research.

HARE, Robert, of Philadelphia, Pa., was born in that city, January 17, 1781, and died there, May 15, 1858. After finishing his academic education, he devoted some time to the occupation of a brewer in the establishment of his father, in which his active mind was engaged upon the chemistry of malt liquors and their preservation. At the age of twenty he entered the Chemical School of the University of Pennsylvania, where, in association with Dr. Benjamin Silliman, he pursued his studies under the direction of Woodhouse. In 1801, Dr. Hare contrived the oxy-hydrogen blow-pipe, and was awarded the Rumford medal of the American Academy of Arts and Sciences. For some years an effort was made in Europe to disprove his claims for the invention of the compound blow-pipe, but in 1813 the merit of the discovery was acknowl-

edged by Dr. Hope, of Edinburgh, in the following language: "For the invention of this very ingenious machine we are indebted to Dr. Robert Hare, of Philadelphia, a gentleman whose merits claim a distinguished rank among the most successful promoters of chemistry in the United States of America." "When it is recollected that this was spoken at a time that a bitter war existed between Great Britain and this country, we can not but admire the spirit of scientific candor manifested, elevated as it was above party feeling or the causes of national animosity." The account of this great discovery, from the pen of Dr. Chapman, may be stated in this connection: "Means of producing a sufficient degree of temperature to melt some of the metals, and other refractory substances, had long been desired by artists, and hitherto had fruitlessly engaged the attention of chemists. At the suggestion of Hare, the chemical society selected this subject as worthy of examination, and he was appointed to manage the investigation of it. The result of his labors was a discovery which has emphatically been pronounced, by a great chemist of Europe, to be one of the most important of the eighteenth century." From the exposition of the discoveries of Dr. Hare and the elder Silliman, made with the instrument of the former, we may judge of the originality of the "Drummond Light," which is only an application of time to the flame of the compound blow-pipe, the intensity of the light under these circumstances being perfectly familiar to these distinguished chemists, and annually shown to their class before any practical application was made of it. In 1810, Dr. Hare accepted the appointment of Chemical Professor in William and Mary College, Va., where he continued until his election to the same position in the University of Pennsylvania. This occurred in 1819. He was in possession of the chair of chemistry in the latter institution until 1847. As a lecturer Dr. Hare was remarkable for the scale of his experiments, which were uniformly successful and impressed the mind by their grandeur. His apparatus was elaborate and perfect so far as mechanical skill and ingenuity could accomplish its completion. In galvanism and electricity he invented instruments which far exceeded those familiar to the scientific world, and produced results before unknown. His Calorimotor, so named from the facility of generating an immense amount of heat, was described in *Silliman's Journal* in 1820. Two years later he promulgated, through the medium of the *Philadelphia Journal of Medical and Physical Sciences*, a new theory of galvanism, accompanied by descriptions of some new modifications of galvanic apparatus. A modification of his apparatus was termed Dr. Hare's Deflagrator. With respect to it we quote the statement of Dr. Silliman: "It is not less a proof of the merits of Dr. Hare's apparatus that Professor Faraday, in 1835, after having exhausted his ingenuity and experience in perfecting the voltaic battery, found that Dr. Hare had already, nearly twenty years before, accomplished all that he had attempted, and with a noble frankness, worthy of all praise, he at once adopted Dr. Hare's instrument as embodying the best results then possible. Its power was sufficient to fuse platinum, with the production of a brilliant light. "It was with these batteries that the first application

of voltaic electricity to blasting under water was made in 1831, and the experiments were conducted under the direction of Dr. Hare." He also contrived an improved Gasometer, a Eudiometer, a Litrometer, a Hydrostatic Blow-pipe, an apparatus for freezing water by the use of sulphuric acid, a single leaf Electroscope, and numerous smaller improvements in chemical instruments. The description of his working apparatus, employed in his lectures, was given in his "Compendium," a book which, originating in a mere outline or syllabus, was, at the time he left the university, enlarged to a bulky volume. Dr. Hare was exceedingly fond of discussing the philosophical bearings of the branch of science which occupied the attention of his lifetime, and occasionally promulgated his views in a controversial way in the journals. He thought for himself, and was not unfrequently in disagreement with Berzelius and other prominent chemists of Europe of the time. One subject which much occupied his attention and gave rise to discussion on his part, was the "Salt Radical Theory." A number of his papers were contributed to the pages of the *American Journal of Pharmacy*. Some of these refer to the especial subjects to which that journal is devoted, and others were upon nomenclature and more general topics. Dr. Hare received the honorary degree of M. D. from Yale in 1806, and from Harvard in 1816. Although he was not regularly identified with the medical profession, and belonged more especially to that class which may be termed philosophical chemists, yet his mind was directed by his associations to improvements in medicine and its several branches; hence it will be found that he endeavored by his experiments to promote the advance of medical science. The preparations of opium, the ethers, and other medical articles, were the subjects of investigation and of suggestions in their formation which were eminently useful. Pharmacy is indebted to him for the method of denarcotizing laudanum; and to toxicology he gave the method of determining minute quantities of opium in solution. In the latter years of his life meteorology occupied much of his attention. The apparatus which Dr. Hare had collected, the greater part of which had been invented by himself, was given to the Smithsonian Institute, at Washington, when he resigned his professorship, and it is deeply to be regretted that the entire collection was destroyed by the fire which laid a portion of that noble structure in ruins.

HARLAN, David, of Churchville, Harford county, Md., was born in that vicinity, in 1809, and died at his home, July 12, 1893. Dr. Harlan began the study of medicine in 1829, under Dr. John Archer, of Rock Run. He afterward attended the University of Maryland. He graduated in 1832, and located in Chestertown, Kent county, and practiced there for three years. He applied for admission to the United States Navy, and was examined in 1835 and commissioned as assistant surgeon. In the spring of 1835 he sailed from New York on the Peacock to Rio Janeiro, around the Cape of Good Hope to Zanzibar, to Muscat, Bombay, Ceylon, Bangkok, Siam, and Canton, China. While in Siam the Asiatic cholera broke out on board the Peacock. Dr. Harlan had charge of the vessel, and lost but one of the crew. Upon his return to the United

States, two years later, he was presented with a sword by the members of the crew. During the Rebellion Dr. Harlan was fleet surgeon of the Gulf Squadron, and near the close of the war the editor of this work formed his pleasant acquaintance during a voyage on the United States supply steamer Fort Morgan, from New York to Key West. Having been ordered to that place, to aid in the care of the soldiers and sailors suffering from a severe epidemic of yellow fever, the kindly advice and suggestions as to the management of the malady, given by Surgeon Harlan, based on his personal experience, has ever been held in grateful remembrance. In 1872 he was stationed at the naval hospital on the government farm at Annapolis. He was promoted to the rank of medical director, in 1871, and upon reaching the age of sixty-two, he retired. He built Trinity Protestant Episcopal Church at Churchville, and was often a prominent member of diocesan conventions. He was a member of the board of visitors to the Naval Academy at Annapolis and was one of the best known and most highly respected citizens of the State of Maryland. He lived to the advanced age of eighty-four years. Four sons, Dr. Herbert Harlan, Judge Henry D. Harlan of Baltimore, W. B. Harlan, and David E. Harlan, survived him.

HARMER, Joseph Randolph, of the United States Army, was born November 6, 1843, in Philadelphia, Pa. He graduated March, 1873, at the medical department of Howard University, Washington, D. C. He served in the Army of the Potomac, in Company K, 118th Regiment Pennsylvania Volunteers, and was wounded and taken prisoner at Shepherdstown, Va., September 20, 1862. He was appointed Acting Assistant Surgeon United States Army, June 1, 1876, since which time he has served in the Department of Texas, and has been on all the scouting trips after Indians and desperadoes and has been complimented by Gen. C. G. Augur, U. S. A., late Commanding General, that department, and Gen. C. H. Smith, Colonel Nineteenth United States Infantry, for bravery and fidelity to duty in action. He has invented a combined field cot and stretcher. His present address is San Antonio, Tex.

HARRINGTON, Devillo W., of Buffalo, N. Y., was born October 23, 1844, at Sherburne, N. Y. He received his education in the common and high schools of Wyoming county, and entered the army during the War of the Rebellion at seventeen, serving three years, being twice wounded. After this he taught mathematics and studied medicine, graduating from the University of Buffalo in 1871. He served two years as resident physician and surgeon of the Buffalo General Hospital, and was appointed surgeon to the Sisters of Charity Hospital in 1875. He was lecturer on clinical surgery in the same hospital in 1876; was consulting surgeon to the Buffalo General Hospital in 1887; and is clinical Professor of Genito-Urinary and Venereal Diseases in the University of Buffalo. Dr. Harrington is a member of the American Medical Association; New York State, Erie County, and Buffalo Medical Associations. He has a large private practice, and in the line of his specialty is one of the most popular and successful surgeons in Buffalo.

HARRISON, James Francis, of Harrison-

burgh, Va., was born in Fairfax county, in that State, March 20, 1822, and is of English and Irish ancestry. He was educated in the home schools in Virginia, and graduated in medicine at Jefferson Medical College, Philadelphia, in 1852. In 1847 he entered the United States Navy as assistant surgeon, and was promoted to surgeon in 1861; was assistant surgeon during the Mexican War, 1847-48, and in 1858 was assigned to duty on the frigate Sabine, and was with Admiral Shubrick in the Paraguay war. He was for three years surgeon in the Confederate States Navy; chief of medical bureau of the latter, and member of the Naval Medical Examining Board. He has lived principally in Virginia. He has received gold medals from the imperial government of France, and from the corporation of Portsmouth, Va., for distinguished services. He was a member of the State Medical Society of Virginia; of the Medical Society of the Confederate States, and vice-president of the State Medical Society, and member of the Academy of Medicine of Richmond. In 1867 he was elected Professor of Medicine and Medical Jurisprudence and Obstetrics in the University of Virginia, and in 1873 was elected chairman of the Faculty. One of his sons, a Professor of Chemistry in the Mobile Medical School, graduated at the University of Virginia.

HARRISON, Joseph, of Greenville, Ala., was born at the junction of the French Broad and Suwanee rivers, in Buncomb county, three miles from Asheville, N. C., February 22, 1828. He was a son of Nathaniel and Sarah (Smith) Harrison, and a grandson of Joseph Harrison, a native of Charles City county, Va.; also a grandson of Daniel Smith, a native of New Jersey, both soldiers of the Revolutionary struggle for independence; the latter a captain in the Continental army. He was a lineal descendant of the old stock of Harrisons, who emigrated from England in the early Colonial days of Virginia. He is of pure English blood, so far as is known. His early school days were passed at old Newton Academy, near his native village. At the age of fourteen he emigrated to Georgia, where his education was completed at an academy of that State. During his boyhood he labored on a farm as a common hand for four years. In January, 1849, he commenced the study of medicine in the office of Dr. A. B. Calhoun, of Newman, Coweta county, and after attending two full courses of lectures at the Medical College of the State of South Carolina, he graduated, March, 1852, in the same class with T. Gailard Thomas, of New York. Having chosen general surgery as his specialty, he located at Carrollton. After remaining there four years, during which time he married Miss Mary L. Tomlinson, he removed to Greenville, Ala. When the war commenced he entered the Confederate army as assistant surgeon and was assigned to duty in the military hospitals of Mobile. A year afterwards he was promoted to the full rank of surgeon and assigned to duty with the Twenty-ninth Alabama Regiment, which was soon afterward ordered to join the Army of Tennessee at Dalton, under command of Gen. J. E. Johnston. He remained with the army to the close of the war. Since the close of the Rebellion he has been established at Greenville, and engaged in a successful practice of general medicine and surgery.

HARRISON, Wallace Kasson, of Chicago, Ill., son of William R. and Susan L. (Kasson) Harrison, was born at Bethlehem, Conn., August 11, 1848. His earliest years were spent in district schools and farm work. He was prepared for college at the Connecticut Literary Institute, Suffield, Conn., and was graduated from Yale College in 1874. In 1875, with Dr. Albert Strong as preceptor, he commenced the study of medicine and attended a course of lectures at Rush Medical College. Subsequently, for several years, he was engaged in teaching chemistry, and in 1882 received his degree of M. D. from the College of Physicians and Surgeons of Chicago, with which college he remained until 1891, as Professor of Medical Chemistry. In 1890 he was elected to the chair of chemistry in the American Col-

Wallace K. Harrison

lege of Dental Surgery, which position he still holds. He is engaged in general practice and is a member of the Chicago Medical Society.

HART, James Augustus, of Colorado Springs, Col., was born at Peekskill, N. Y., December 19, 1849. After completing his academic education he studied medicine and was graduated from the College of Physicians and Surgeons, New York, in 1873. He was resident physician at St. Peter's Hospital, Albany, N. Y., the following year, and practiced medicine and surgery in that city, from 1874 to 1876. On account of ill health he then went to Colorado, located at Colorado Springs, and practiced there until 1886. He spent the following three years on the Pacific Ocean, as surgeon to the Pacific Mail Company. In 1889 he returned to Colorado Springs, and resumed a successful general practice of medicine and surgery.

HARTSHORNE, Edward, of Philadelphia, Pa., was born in that city May 14, 1818, and died there June 22, 1885. He was the second son of Dr. Joseph Hartshorne, a well-known

hospital surgeon and leading practitioner of Philadelphia for nearly fifty years. He graduated A. B. at Princeton in 1837; received his degree of A. M. 1840; pursued his medical studies in the University of Pennsylvania, under the direction of his father, having commenced the study at Princeton in the office of Dr. S. T. Howell, then Professor of Anatomy and Physiology in Princeton College, and obtained his degree of M. D. from the university in the last-named year. Under the guidance of Dr. W. W. Gerhard he spent almost a year in dispensary practice, and in December, 1841, after a brief service as resident pro tem. in the Pennsylvania Hospital; was elected First Assistant Physician to the Pennsylvania Hospital for the Insane, which was then just opened for occupation in West Philadelphia, and of which Dr. Kirkbride was at the same time elected superintendent. During this service he superintended and conducted the transfer of the patients from their old quarters to the new, and had the immediate charge of the entire re-organization under Dr. Kirkbride. In April, 1841, he was elected Resident Physician of the old Pennsylvania Hospital, but still continued at intervals to aid Dr. Kirkbride, and also for a short time served as substitute to Dr. Pliny Earle, superintendent of Friends' Asylum for the Insane, near Frankford. In March, 1843, he was elected Physician to the Eastern State Penitentiary, being the first medical officer resident in that institution. In June, 1844, he went to Europe and passed two years in study, visiting hospitals, lunatic asylums, and penal institutions as well as medical schools, both of Great Britain and the continent. On his return he entered into the practice of his profession, both in connection with and independently of his father. He married, December 26, 1850, Adelia C. (Pearse) daughter of John B. Swett, of Philadelphia. He was elected one of the attending surgeons of Wills' Hospital for Diseases of the Eye in 1852, and resigned in 1859, when he was elected one of the attending surgeons to the Pennsylvania Hospital, which position he resigned in 1864. During his student life he was elected junior secretary of the Philadelphia Medical Society, and after graduation was elected senior recording secretary of the same society; in 1848 he was secretary of the first Prison Discipline Convention held in Philadelphia, and subsequently held a similar position at the first sanitary convention held in the same city; for several years was secretary of the College of Physicians, one of the censors of the college, secretary of the building committee, and chairman of the hall committee; was for many years an active manager of the Episcopal Hospital in Philadelphia, and secretary of its building committee and committee of arrangements, was one of the organizers, and during the whole of its existence was secretary of the executive committee of the Philadelphia branch of the United States Sanitary Commission; chairman of the committee of arrangements of the American Medical Association at the Philadelphia meeting in May, 1872; served as vice-president and president of the Pathological and of the Ophthalmological Societies of Philadelphia; was chairman of the executive committee of the Medical Alumni Society of the University of Pennsylvania, and vice-president of that society; also alumni manager of the Univer-

sity Hospital. His thesis, presented on graduating, and which was ordered to be published by the faculty of the university, was a "Monograph on Pseudarthrosis; or False Joints from Ununited Fractures." Other publications from his pen are numerous reports of cases, reviews and other contributions in the *Medical Examiner*; investigations on the "Separate System" for criminals, as embodied in the "Annual Report of 1843" of the Eastern State Penitentiary; also a partial report for 1844, published by the inspectors in 1844 and 1845; the first of these reports, having reached a second edition at home, attracted considerable attention in England, and was translated and published in France, Germany, Belgium and Holland; editorial articles in the *Philadelphia Journal of Prison Discipline*; reviews and bibliographical notices and original papers in the *American Journal of the Medical Sciences*, the *Philadelphia Medical Examiner*, and the *Medico-Chirurgical Review*; annual reports of the Episcopal Hospital, and was editor and annotator of various English medical text-books, among them "Taylor's Medical Jurisprudence," of which work he superintended two editions, his annotations being approved by the author and quoted in the later English editions. During the war he was actively engaged as Acting Assistant Surgeon United States Army, serving to some extent in the field, and during most of the time as consulting surgeon in army hospitals in Philadelphia. He was also medical examiner and adviser for a long period to one of the leading life insurance companies of Philadelphia, as well as to others for shorter periods, being probably the oldest in that department of his profession in Philadelphia; and for some time was one of the vice-presidents of the Princeton Alumni Association of Philadelphia. He was a member of the American Philosophical Society; of the Academy of Natural Sciences, and of the Histological Society of Pennsylvania, as well as of other kindred associations, medical and general.

HARTSHORNE, Henry, was born in Philadelphia on March 16, 1823, and is a son of the late Dr. Joseph Hartshorne. He was educated at Haverford College (then Haverford School), whence he graduated in 1839. His medical preceptors were his father and his elder brother, Dr. Edward Hartshorne, a distinguished physician and surgeon. He was graduated in medicine from the University of Pennsylvania in 1845. He obtained the degree of A. M. at Haverford College in 1860, and the honorary degree of LL. D. from the University of Pennsylvania in 1884. He was married, in 1849, to Mary E. Brown, daughter of Jeremiah Brown, of Philadelphia. He was elected Professor of the Institutes of Medicine in the Philadelphia College of Medicine in 1853, and in June, 1855, the Board of Guardians of the Poor selected him as one of the Consulting Physicians and Lecturers on Clinical Medicine in the Philadelphia Hospital. In 1858 he filled the position of secretary of the State Medical Society of Pennsylvania, and was Recorder of the Biological Department of the Academy of Natural Sciences of Philadelphia. A portion of the years 1858-59 he traveled in Europe, visited Egypt, and ascended the Nile as far as Thebes. On his return to the United States he was elected, April 27, 1859, Professor of the Practice of Medicine in

the medical department of Pennsylvania College, to fill the vacancy occurring by the resignation of Dr. Stillé. In the following month of the same year he was chosen Attending Physician of the Episcopal Hospital. He was named Professor of Anatomy, Physiology, Natural History and Hygiene, in 1862, in the Philadelphia Central High School. In 1866 he was elected to the Professorship of Hygiene in the University of Pennsylvania, and was made Professor of Organic Science and Philosophy in Haverford College, in 1867. He has also held, at different times, professorships in the Pennsylvania College of Dental Surgery, Girard College, and the Woman's Medical College of Pennsylvania; and, in addition to the hospitals previously named, has also been Attending and Consulting Physician of the Woman's Hospital of Philadelphia. He has been, and still continues, quite a voluminous author, both scientific and literary. His first production, in 1846, was his graduating thesis, entitled, "Water vs. Hydropathy." Next followed a "Monograph on Glycerine and its Uses;" "Facts and Conclusions upon Cholera;" "Memoranda Medica;" "Guide to the Medicine Chest and Family Adviser;" "Essay on the Arterial Circulation," being the prize essay of the American Medical Association for 1856. His "Essentials of the Principles and Practice of Medicine" first appeared in 1867. Within four years after its original publication two large editions were exhausted; in 1872 a third edition, thoroughly revised, was put forth, and in 1881 a fifth edition appeared. This work has been translated and published in Japan and over 25,000 copies have been sold up to this date, 1893. In 1869 the first edition of "A Conspectus of the Medical Sciences" was issued, being hand-books on anatomy, physiology, chemistry, materia medica, practical medicine, surgery and obstetrics. This work was prepared with the aid of collaborators, or experts in some of the special subjects intrusted to them; he confined himself to the divisions of anatomy, physiology and practice of medicine. This has also been translated and published in Japan. He edited, with considerable additions, the second American edition of Sir Thomas Watson's "Lectures on the Practice of Medicine," in 1874, which task was so well performed as to call forth a very kind and favorable acknowledgment from the distinguished author of the book, which was communicated in a letter to the publisher, Henry C. Lea. In 1879 he edited, with twelve new original articles and numerous annotations, "Reynolds' System of Medicine," consisting of three large volumes, by noted English writers. He prepared the articles on "Etiology," "Diagnosis and Prognosis" in Pepper's American System of Medicine. For many years he was a frequent contributor, especially in reviews of medical works, to the *American Journal of the Medical Sciences*. He has also written occasionally for the *American Naturalist*. A number of his papers have appeared in the Transactions of the Philadelphia College of Physicians; one "On Organic Physics," in the Proceedings of the American Philosophical Society; one "On the Relation Between Vigor and Sex," in the Proceedings of the American Association for the Advancement of Science, and a paper on "What to do Against Yellow Fever," for the American Public Health Association, 1873.

He contributed in 1872-73 a number of important articles to *Johnson's New Illustrated Cyclopaedia*, among which may be named those on "Hygiene," "Anatomy Philosophic," "Brain," "Circulation of the Blood," "Deaf Mutes" and "Evolution." Of these the last was the most original and elaborate, endeavoring to give a full and concise summary of the whole subject, with the conclusions justified by the present state of science. His literary works embrace "Woman's Witchcraft, or the Curse of Coquetry," a dramatic romance, which appeared in 1854, under the *nom de plume* of Corinne L'Estrange. This book is credited, by mistake, in the catalogue of the Philadelphia library to some lady author. "Bertram, the Prince, and Other Poems" was printed in 1892. He has also contributed several poems to periodicals, especially to *Lippincott's Magazine*, *Penn Monthly*, and the *Friend's Review*, and also prose literary essays on literary and religious subjects to the last named serial. He also contributed "European Correspondence" and other facetiae to *Vanity Fair*, edited by Charles G. Leland, 1860-61. His latest medical papers have been on "Pneumonia—Its Mortality and Treatment," Philadelphia College of Physicians, 1888, and on "Cholera and its Migrations," in *Philadelphia Medical News*, 1892. In the former paper he opposed the modern treatment of pneumonia with whisky, quinine and opium; in the latter he urged the superiority of local and domestic sanitation, instead of quarantine, in the prevention of epidemic cholera. After a break-down in health from over-work, in 1858, Dr. Hartshorne gradually withdrew from practice, and gave a good deal of time to teaching and literary work outside of the medical field; but he continued his study and labor in medical and sanitary science, as the above-named publications give evidence.

HARTSHORNE, Joseph, of Philadelphia, Pa., was born in Alexandria, Va., December 12, 1779, and died near Wilmington, Del., August 20, 1850. His father, William Hartshorne, had removed from New Jersey a short time previous to the commencement of the Revolution. His ancestors were Quakers who emigrated to this country on account of religious persecution, from a long established family in Leicestershire, England. The pioneer of the family, Richard Hartshorne, arrived at the American homestead on the Highlands of Neversink in 1669, and subsequently as one of the proprietaries in association with the Duke of York and William Penn, in 1682, became one of the largest land-holders in the Province of East Jersey. A portion of the estate, including the original seat of the head of the family, is said to be still in the possession of a lineal descendant. From an extended memoir written by his son, the late Dr. Edward Hartshorne, and published in the American Medical Biography, the editor of this work derives the following interesting details concerning the life, history and professional achievements of the subject of this sketch. But for an accident, which had a marked influence upon his habits, Joseph Hartshorne would most probably have followed the example of his father in confining himself, at least in early life, to commercial pursuits. Although in other respects of vigorous and active frame, he early increased the interest of his parents in his intellectual progress by a calamity which, at the

age of five years, had thrown him upon his mental resources by rendering him a cripple for life. Having been exposed to cold while under the influence of calomel, at the close of an attack of small-pox, his feet were attacked with a deep-seated suppurative inflammation, which was allowed to produce a permanent contraction and flexion of the toes, and consequently incurable deformity and lameness. His inability to engage in the customary sports of boyhood naturally developed an originally sensitive and retiring disposition, and led him to seek the society of those who were older than himself, and to engage in more mature pursuits than those of ordinary boyhood. The loss of the companionship of his more active schoolfellows also, by subjecting him constantly to independent means of entertainment, strengthened a self-reliant nature, and taught him to find, in a resort to books and to his own reflections and observations, a higher reach of pastime, instead of the more physical enjoyment which his lameness had denied him. His own sad experience, also, doubtless increased his sympathy for the sufferings of his neighbors; and, by interesting him in their various bodily ailments, probably led the way to his subsequent vocation. The first effect, however, was simply on his aspirations as a general student. Gifted with a retentive memory, clear perception, strong reasoning powers, and entire independence of judgment as well as general activity of mind, he devoted himself with energy to the exercises of the Alexandria Academy, at which, under the able direction of its worthy and learned principal, Dr. McGrath, the chaplain and valued friend of Washington, he became a distinguished pupil, and completed his collegiate education. Latin and French were the favorite languages of his early studies; and the familiarity which he often manifested in after years with these, no less than the force and precision with which he wrote and spoke his native tongue, were characteristic of the thoroughness and accuracy of his scholastic training. Upon leaving the academy, he entered the counting-house of his father, for the benefit of a business education under the paternal eye, which was deemed of great value to the young men of the neighborhood, on account of the high standing of Mr. Hartshorne, in that part of the State, as a merchant and a man. The good effect of this commercial training was very striking in his prompt, punctual, methodical, and industrious habits, in conducting all his affairs in after life. Without interfering with his inclination for study, it developed his natural aptness for order and precision, and increased the practical turn of mind, which, in spite of a naturally impulsive, and even enthusiastic disposition, eventually became a ruling and invaluable characteristic. It was at this period, too, that he established the perfect physical health which enabled him to devote himself to an enormous amount of mental and bodily labor, without intermission, throughout a long succession of years. During an interval of nearly forty years, he was not obliged to rest three days in succession on account of sickness or fatigue; and it was a rare thing for him to indulge in a single day's withdrawal from professional labor for purposes of recreation. He was an old man and an invalid before he was willing to absent himself from his post; and even then he was ready to

attend to what he regarded as the call of duty, without regard to his own condition, and without thought of compensation, wherever and whenever the claims of friendship or humanity were properly presented to him. While dividing his time between the warehouse at Alexandria and the flour-mills at Strawberry Hill, he was induced, by the urging of his friends and some members of his family, whose penetration had already suggested his proper calling, to engage in reading works on medicine, with a view to his ultimately becoming a physician. He entered upon the course, however, with great reluctance. Although fond of the study, the prospect of undertaking the practice of the healing art was so distasteful to him that he at first resisted the importunities of his advisers, but was finally persuaded to make the trial, in consideration of his lameness, which was supposed to incapacitate him for more active occupation. He therefore became a regular pupil of Dr. James Craik, the family physician of Washington, and former surgeon of the Continental Army. Dr. Craik was the favorite military surgeon and medical adviser and companion of General Washington in all his campaigns, from the ill-fated Braddock's expedition until the close of the Revolutionary War, and possessed, in character and varied experience, unusually valuable qualifications as a private professional teacher. Our young student, however, was destined for a wider field. After one or two years' preliminary reading and practical study with his accomplished preceptor, he was enabled, through the assistance of his uncles, Samuel Coates and Pattison Hartshorne, of Philadelphia, then influential managers of the hospital, and of other relatives in that city, to secure an appointment to the post of resident apprentice and apothecary, then vacant in the Pennsylvania Hospital. He entered this institution on the 27th of July, 1801, and thus commenced his residence and professional career in Philadelphia, about the middle of his twenty-second year. He entered the medical class of the University of Pennsylvania at the commencement of the succeeding term; and, from that time forward, was assiduously engaged in the practical duties of the hospital, as well as in the more theoretical occupation of the library and lecture-room. We have not space to dwell on the reputation of both the schools in which he was so fortunate as to be thus auspiciously established. Nor need we say any thing of the importance and value of the teaching he enjoyed, as hospital surgeon, under such men as Rush, and Wistar, and Physick, and Barton, who were the physicians and surgeons of the hospital, and his preceptors in the university. It is enough to say that he soon became warmly interested in the splendid opportunities afforded by his new field of observation, and did not fail to devote his whole time and energies to the mastery of the science and art, the grand object and nature of which he had just begun to comprehend, in their application to the stern realities of life before him. His previous apprehensions and antipathies were soon merged in a higher sense of admiration for the glories of the science, and a determination to unveil its mysteries for the noble purpose of abating the miseries of his fellow-men. During his five years' term of service, the library and the museum received a large share of his

attention. Probably no resident of the institution ever made himself more familiar with the books of the library, or the preparations of the museum than did Dr. Hartshorne, while they continued in his care; and it is worthy of note, that to him is due the first regular alphabetical catalogue prepared for publication at the hospital, as is shown by a special vote, in acknowledgment and commendation, which is on record in the minute-book of the board of managers. As he was no mere closet student, however, our librarian was still more diligently engaged in improving his acquaintance with the ravages of disease and injury in the ward and the dead-house, and in advancing his knowledge of anatomy and surgery by the exercises of the dissecting-room. His interest in the study of anatomy and physiology, especially attracted the attention of Dr. Caspar Wistar, then the distinguished professor of the former branch; and his proficiency in the professor's favorite study was probably an influential source of regard which Dr. Wistar continued to manifest for him in after years. Dr. Hartshorne justly attached the highest importance to a thorough knowledge of anatomy in all its details and applications; and in insisting upon it as, with physiology and pathology, the only true and substantial basis on which medical and surgical skill should rest, he was accustomed to attribute much of the confidence he felt in both medical and surgical practice to the familiarity with it acquired by him while a hospital student. Although always willing to listen to authority, and able and ready to give a reason for his own belief and precept, he was too much a student of nature, and too independent in his habit of thought, not to value above all things in the pursuit of his profession the faculty of observation, and the ability, through a knowledge of healthy manifestations and appearances to direct his faculty to a useful end. After some seven years' study, four of which were spent in the hospital, and in attendance on the university courses, he took his degree of Doctor of Medicine. The thesis which he presented on the occasion of his graduation was an experimental one, "On the Influence of the Atmosphere in Respiration." It was published at the time, in accordance with the custom of the day, and copies of it are still extant. Although prepared and written under the press of his numerous duties as senior hospital resident, it gives evidence of literary taste and scholarship, and as a specimen of original investigation, is indicative of the ability and learning which soon rendered its young author conspicuous among his brethren. During the last twelve months of his service at the hospital, he was authorized to take the entire charge of the out-patients of the institution, in connection with a charity which has since been given up to the City Dispensary. For this purpose he was allowed the use of a horse and gig; and in the course of the year he was called to prescribe for seventeen hundred different patients, the record of whose cases is still preserved. During the latter few months of his residence in the hospital, also, he engaged in the translation of "Desault's Clinical Lectures on Fractures," and had nearly completed his work, and secured a number of subscribers for the publication, when he was forestalled by a competitor. This induced him to prepare, at very short notice,

an American edition of "Boyer's Treatise on Diseases of the Bones," with an original appendix, containing notes of cases, and descriptions of some new forms of apparatus; the notes and descriptions being illustrated with several handsome copper-plate engravings. This is the only work in the book form with which his name has been connected as author or editor. He was at no time fond of writing for the press, and he soon became too much absorbed in the routine duties of his public and private practice to be able to devote any time, but what was needed for repose in bed, to labors with the pen. The few papers he has contributed are, like his appendix to the edition of "Boyer on the Bones," entirely practical in their character, and intended to announce or elucidate some new or peculiar mode of treatment, which had been successful in his hands. He was in the habit, however, of recording all his important prescriptions from day to day, and briefly noted the cases of interest that occurred to him. Large numbers of memoranda of this kind are to be found throughout his book; but, although interesting, and to some extent available, they are not sufficiently connected in themselves to admit of arrangement for the press. His residence in the hospital was further distinguished by the introduction of an improved apparatus for the treatment of fractured thigh, which, for efficiency and simplicity, is superior to many that have been presented since. It still holds its ground in many places; and with the adaptation of more recent modes of applying the extending and counter-extending bands, may yet be regarded as one of the best forms of splints for the purpose. It is said that he attached but little importance to the claim of "originality" in the contrivance of instruments and apparatus, or in the minor modifications of treatment, well knowing that the suggestions of practice are so frequently the same to intelligent and ingenious practitioners, that there are few expedients which have not occurred again and again, under the stimulus of necessity, to different individuals; and that very many of the so-called new inventions are to be found among the illustrations of our oldest works. These are the small vanities of the profession, which, in spite of his constant habit of adapting his own means to the particular end in view, without subservience to established rule, he sometimes undervalued in his own case, and disregarded in others. So far did he go with this feeling, that he described his splint for fractured thigh as a modification of that of Boyer, although it was altogether unlike its imaginary model, and only resembled it, in common with Desault's, in treating the fractured limb in the straight position, and in the employment of a leather socket, which he soon afterwards abandoned. An opportunity having been presented for his embarking on a voyage to Batavia, as surgeon and supercargo of an East India merchantman, he obtained permission to resign his office at the hospital some six weeks before the expiration of his five years' term of service. The certificate which was given him on this occasion, after speaking in the most cordial terms of his conduct, during his residence in the institution, as meriting their highest esteem and respect, goes on to say: "In the practical duties of his profession, he has displayed, under the inspection and advice of six of the most em-

inent physicians of Philadelphia, a skill seldom to be met with in practitioners of his years. From a well-founded confidence in his abilities and fitness for the charge, the care of the out-door patients has been intrusted to him exclusively during the last year of his meritorious services; and the uncommon success with which his practice was marked, left us no cause either to regret or to diminish our confidence in him." This voyage occupied him about ten months, and was very successful in a pecuniary point of view, at the same time that it was advantageous in other respects. He was soon tempted to make a second venture, during which he was absent some fourteen or fifteen months, three of which was spent in a residence at Batavia. The mercantile result of the second voyage was as unfortunate as that of the first had been prosperous; and the surgeon and supercargo returned to his proper position in Philadelphia, a poorer man than when he left it. The lessons and opportunities of the new field, however, were by no means lost. The diseases and incidents of a long East India voyage, in the strongly-manned vessels of former days, and the malignant fevers and bowel affections so prevalent in Batavia at that time, afforded him ample professional employment, as well as means of enlarging his medical experience. Nor was this episode in his professional life without its moral tests. On two different occasions, his integrity and firmness are known to have been severely tried. Once, as supercargo, while seeking freight for his ship, he was offered a large consignment of spices, then monopolized by the government of Holland, on terms so advantageous as to manifest the smuggling character of the transaction by which they were obtained. He refused to be a party to a fraud which he could only suspect, and might easily have winked at without fear of exposure; and thus saved his honor at the expense of a certain fortune. The second trial was much more severe, as well as more appropriate to his peculiar mission. During the second voyage home, the master of the ship, a man of courage and ability, but unusually stern and arbitrary, even for those days of ocean despotism, subjected his crew to an allowance and quality of rations which created a serious amount of sickness as well as discontent among the men. Dr. Hartshorne not only refused to justify the captain, but boldly protested against his course, and continued to insist upon a change, until he had secured it to some extent, although at the cost of his own comfort and liberty throughout the remainder of the voyage. He was banished to the fore-castle, and at one time would have been put in irons, if it had not been for the undisguised sympathy expressed for him by the subordinate officers and men, whose rights he was defending. It may be remarked here that his determined stand against oppression of these poor mariners was only in accordance with the spirit of his whole after-life, in ministering to the sick and wounded who were confided to his care, and in protecting what he deemed to be their rights and needs, against the negligence or perversity of the attendants and friends. Nurses and patients, of whatever position, well knew that his orders were meant to be obeyed without alteration or delay. He never hesitated to resent the absurd and mischievous intermeddling so common in the sick-room; nor was

he much more patient under the infliction of unreasonable and often impertinent catechizing, so often visited upon the doctor under plea of interest in the patient. To the bluntness manifested on these occasions towards irresponsible parties in and out of the sick-room, and to the sternness with which he was apt to rebuke the careless or disobedient, may be attributed much, if not all, of his reputation in many places for roughness and impatience. To the patients themselves he was ever tender and sympathizing, as he was to all who were really in affliction; although he never withheld the truth when it was unequivocally asked for. His own family and old friends,—all, indeed, who knew him best,—felt not the slightest fear either of words or frowns, unless really deserved, and were more likely to expect a warm grasp of the hand, and a benignant smile or hearty laugh, than either. On reaching Philadelphia once more, he was glad to settle down, and enter permanently upon the practice of his profession. His apothecary's training at the hospital, and his extensive professional acquaintance, together with the very limited income to be hoped for at that early stage of his career, induced him to engage in partnership with an old friend as a druggist. With this view he opened an apothecary's shop and physician's office in Market street above Eighth. A two or three years' trial of this kind of life satisfied him, that, although it was common, at that period, for city practitioners to compound their own prescriptions, as it now is in the rural districts, and the two different callings were not considered incompatible with each other, such a mode of prosecuting his vocation was not suited to his interest or temper. He therefore opened an office alone, within a short distance from his former hospital home. Here commenced the long struggle which, notwithstanding the difficulties incident to his lameness and to his entire dependence on the receipts of his daily labor, was destined to end so happily to his advantage. The advance was slow, however, and the trial especially hard to one who had never known what it was to want, until he had left his father's house. That father had been reduced by the misfortunes of others in his old age; and although still anxious to aid his favorite son by giving him a home in his native town, in the hope of securing him a practice there, the only answer to his urgent offer was the prompt reply, that the paternal roof was no place for the sons, until they could bring their fortunes with them. In the year 1813, Dr. Hartshorne was married to Anna Bonsall, eldest daughter of Isaac Bonsall, a prominent minister of the Society of Friends in Philadelphia; and his practice already quite respectable in medicine and surgery, from that time rapidly increased. In 1815, he was, without solicitation on his part, unanimously elected one of the surgeons of the Pennsylvania Hospital, he having withdrawn from a canvass for a similar appointment a year or two previously, in favor of Dr. John Syng Dorsey, nephew of Dr. Physick. His colleagues then, and during several years, were Drs. Physick and Dorsey, who already regarded him as a rising competitor for their well-earned fame. This return, in a higher capacity, to the scene of his early exploits, extended his general reputation, and brought him more prominently before the public as a

practical surgeon. Upon the death of Professor Wistar, in 1818, his rising *protégé* succeeded him as attending physician in a large number of respectable families; and he began to be regarded by a considerable party as likely to be a desirable acquisition to the medical faculty of the university, which had just met with so severe a loss in the decease of his distinguished patron. Accordingly, when the chair of Surgery became vacant by the transfer of Dr. Physick to the Professorship of Anatomy in Dr. Wistar's place, Dr. Hartshorne was urged as a candidate therefore, in connection with the accomplished Dr. Thomas T. Hewson, then already popular as a teacher of Surgical and Comparative Anatomy. The canvass by the respective competitors and their advocates was an exciting one, although Dr. Hartshorne took no personal part in it. Dr. Hartshorne and his associate fell short by one vote only of the number that placed the successful candidate, Dr. Gibson, in the station which he so long held in the school; and, as Dr. Evans, from whose excellent memoir we freely quote, remarks: "It is no disparagement to the latter to say, that the strong desire to transplant from a neighboring and rival school one who promised to contribute much to its rising reputation, was, at the time, generally understood to have been the principal cause of Dr. Hartshorne's defeat." He has often said, continues Dr. Evans, that his failure on that occasion was fortunate on many accounts, and that his private practice was immediately and decidedly augmented after it, so much so, that he would never have been willing to perform the duties of the two together, even if the additional patients had been still disposed to seek him. To use his own expressive phrase, he would not have been hampered with the professorship. He was no office-seeker, and averse to mingling in crowds; and hence he not only declined all invitations to public positions which might have extended, what he shrank from, his notoriety, but was rarely seen in the large social gatherings which are so common among the leading professional men of the city, and especially at the houses of the professors of the different medical schools. Although given to individual hospitality with all the warmth of his native State, and rarely without a guest in his house and at his table, he had no taste for social display, and never engaged in general entertainments. He was, therefore, known to the students only at a distance and in his hospital service; and, although he commanded their respect and confidence, he never sought that personal and social popularity among them which is so important in the relations between the teacher and his pupils. In a more intimate course with them, however, he would not have failed to attach them strongly to him, as he did all those with whom, as private preceptor or consulting medical counselor, he was brought into association. He was candid and indulgent, always taking and expressing an unaffected interest in young medical men who proved themselves deserving and capable in the discharge of their duties, and ever ready not only to advise them in difficulties, and to protect them from misrepresentation or imposition, but to award them whatever praise their skill or good conduct may have merited. In the year 1820, Philadelphia was visited by the yellow fever; and from that period up to 1830,

there was a remarkable prevalence of epidemic diseases. Influenza of an aggravated character, as well as bilious fever in its various forms, visited, at short intervals, most parts of our country; and the city of Philadelphia, with its adjacent districts, repeatedly suffered from their inroads. Of the many eminent physicians who, during that time, resided there, perhaps, there was no one more constantly occupied with the duties of his profession, few as much so, as Dr. Hartshorne. The calls upon him, either as attending or as consulting physician, were not only numerous from all parts of the city and districts, but he was constantly resorted to from that section below the city known by the name of "The Neck," with the inhabitants of which he had long been extremely popular, as well as from different parts of the neighboring country. In addition to the great amount of business thus heaped upon him, he was frequently consulted through letters by physicians at a great distance. Some idea may be formed of the extent of his practice at that period, from the fact that, during the course of a single autumn, he prescribed for over two hundred and eighty cases of fever alone, nearly all of which were under his personal care and attendance. The constant demand made upon his time by his private practice, rendered it necessary for him to give up his appointment as surgeon in the hospital, and in 1821 he accordingly sent in his resignation, after a connection with it, as apprentice, resident physician, and attending surgeon, of nearly twelve years. It was thus that so many years of Dr. Hartshorne's life were passed; the reputation for skill and experience which he had acquired adding to his multiplied cares, and securing a continual interruption to rest or pleasure. He continued to devote the untiring energies of his powerful and cultivated mind to the duties and responsibilities of a wide-spread practice, never relaxing in the course he had marked out, until the time arrived when he, too, was obliged to succumb to the inroads of sickness and the shadow of death. His naturally strong constitution, sustained by an active life in the open air, his strict temperance, his extreme cleanliness of person, and regular mode of life, so far as his professional duties would admit, enabled him to resist the infirmities of age almost entirely, until he had nearly completed his allotted threescore years and ten. He had undergone two very severe mental shocks, at some five years' interval; the one being the loss of his eldest daughter, by a rapid consumption; and the other the, for some time, uncertain loss at sea of his eldest son. He had also been subject to occasional attacks of biliary obstruction, probably from gall-stones, for several years, but had never been obliged to interrupt his daily avocations. It was not until the autumn of 1848, and especially after the summer and fall of 1849, that he gave evidence of more serious disorder. The cholera epidemic of 1849 subjected him to numerous appeals from old and new patients, notwithstanding that he had previously been largely curtailing the extent of his practice. He became warmly interested in the work, and was once more almost as busily employed as he had ever been in his best days. While the excitement lasted, he did not appear to suffer; but the close of the season, and the cessation of the contest with the pestilence,

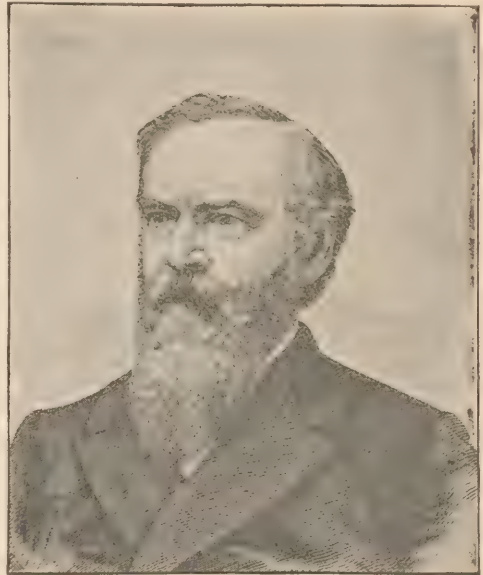

left him exhausted and fatally diseased. The remaining months of his failing life were but a struggle with inevitable decay, in which the intervals of comparative ease were just long and decided enough to delude him into the effort to go on with his labors, and to answer the calls which were daily made upon him, and often pertinaciously pressed, even in his sick-room, and when he was unable to leave his bed. Thus he dragged on a weary life, with little hope of improvement, and in entire resignation to the change which he knew was rapidly approaching, until the latter end of June, 1850. At this time he determined to leave the city, in order to secure the undisturbed repose which was impossible in his own house; and he had himself carried to the Brandywine Springs, near Wilmington, Del., there to spend, in a pure air and perfect retirement, the few days that yet remained to him. "At this place, attended by his sons, with the aid of Drs. Shallcross and Goddard, and surrounded by his family, he breathed his last, in peace with all men, and in the firm assurance of a better life above, through the salvation which is in Jesus Christ alone." Having always been, by preference as well as birthright, a member of the religious society of Friends, now designated as the "Orthodox" denomination, Dr. Hartshorne's spiritual views were in conformity with the principles held by that body, although he attached but little importance to peculiarities of language and dress. When not overwhelmed with care, he was fond of social conversation, generally cheerful, and often quite hilarious, yet his mental abstraction would not unfrequently, and especially among strangers, or in the street, render him apparently unconscious of persons and things around him. In this way he would create, on cursory observers, an impression of reserve and taciturnity, which was not his ordinary habit. Still the cast of his mind led him to serious reflection and its kindred reading. He took pleasure in theological discussion, but not in disputation; and much of the leisure of the latter years of his life was spent in the study of the Bible and its literature, and of standard works on religious belief and experience. Decided in his own views, he was ever willing to listen to those who differed from him, while he strove to live in charity with all. Few men were more determined or independent than Dr. Hartshorne, when compelled to take an authoritative position under the dictates of his own reason and conscience; and yet, although never shrinking from responsibility, he had no wish to govern others. He never dogmatized; and was so adverse to mere argument, that he generally preferred dropping a subject to disputing over it. "I wish to live in peace and friendship with all mankind, and especially with my professional brethren," was his remark to an old friend in reference to a controversy then prevailing in medical circles, the subject of which he did not consider worthy of the excitement created by it. "He was the most scrupulously truthful man," continues the same friend, "I ever knew. On whatever subject Dr. Hartshorne spoke, it never occurred to his auditor that an idea or word could be at variance with his real opinion, or inconsistent with the fact as he understood it. He was content to rely on the simple potency of truth, and always said exactly what he meant, never attempting

either to add force to his assertion by artificial emphasis or ornament. There may have appeared, in this singleness of purpose and absence of embellishment, a lack of some of the sophistication, not to say suavity, of polished society. There may have been absent, also, some of the conventional courtesies which are too apt to be used as cloaks, and which, as such, he held in light esteem. But in that just consideration for the persons and opinions of others, in which true politeness consists, and which has the golden rule for its only guide, he was never intentionally deficient, and usually carefully observant. Beneath an occasional brusqueness of demeanor, and sometimes, when the occasion perhaps demanded, of actual severity, there was a large amount of native goodness of heart; and his sympathies were ever in active exercise towards the afflicted, save when the graver duties of his profession called forth the higher and sterner attributes of his mind. An anecdote occurs to us, which exemplifies the remark just made in a forcible manner. It was related to us by a professional brother, who was then attending with him in the capacity of house-surgeon of the hospital. In the course of his routine, he was observed to visit the cell of an old friend and schoolmate, who was confined therein, a raving and unmanageable maniac. He was so overcome by his feelings, that he stood outside the door, weeping like a child, for some minutes, before he was able to regain his self-control; but the moment the door was open, and the physician and patient were confronted with each other, all trace of the recent yearnings and weakness of the heart were gone, and an air of firm and calm authority alone appeared." Referring to his professional character and standing, one of his biographers, Dr. Evans, has said that no one could be long associated with him, without being convinced of his extensive and exact knowledge of the principles governing the science of medicine; of his diagnostic acumen, and clear perceptions of the changes effected by disease; together with a thorough familiarity with the art applying, in the most successful manner, those agents most effective in arresting and removing it. Hence, in the sick-room he was distinguished by the facility with which he made himself acquainted with the nature and extent of the case before him, by the exercise of great sagacity, close observation, and the well-remembered teachings of a large experience; arriving at conclusions which, although not universally correct, because no human judgment is infallible, the event seldom proved to have been erroneous; and having satisfied himself of the character of the malady with which he had to combat, while always moving with great caution, his course was unhesitating, and regulated by principles from which nothing would tempt him to swerve. As a surgeon he was prudent, but never timid, and he was ever anxious to avoid the knife, when he thought it could be safely dispensed with. He was a decided and strong advocate for the use of the lancet; not resorting to it, however, empirically, without reference to the existing state of the constitution, and of the various organs of the body, but always with precise views in his application, and having a distinct and satisfactory reason for its use. He was aware of there being an impression abroad that he had, from habit, carried the use of this powerful remedial

agent too far; but, after renewed consideration of the subject in all its bearings, his convictions of the correctness of the course he had pursued were confirmed; and in a conversation held with the writer, a short time previous to the commencement of his last illness, he remarked that, upon a careful review of his extensive practice, he could recall no single case that caused him any regret for having bled in it too freely; but there were many in which he feared he had erred, either by not bleeding in them at all, or having deferred it until it was too late. Being solicitous of keeping pace with the progress of medicine, so far as his numerous engagements would permit, he was a constant reader of the medical journals and other publications of the day, gladly availing himself of the thoughts and experience of others. The impulse of his own mind, however, prevented him from circumscribing his reasoning upon the subject, within the limits marked out by the author he was perusing, since, his reliance being chiefly on the deductions of his own mind, whether in agreement or opposition to the opinions of others, he was necessarily prevented from becoming a mere imitator. The great confidence which his professional brethren reposed in his judgment was evidenced by the frequency with which they resorted to him for advice in consultation, in the latter part of his life this constituting a large part of his practice. And in this intercourse with other physicians, while he never concealed his sentiments for reasons of policy, or appeared to acquiesce in what he really disapproved, for fear of infringing on the laws of politeness, yet he invariably treated all with candor and becoming deference, and was always ready to listen to whatever was offered in relation to the facts connected, or remedies proposed, in the case. Satisfied that, with all his boasted talents and acquired skill, the efforts of man in warding off the approach of death, or for restoring health and strength, were unavailing, except as they were rendered effectual by the blessing of the Almighty, he freely acknowledged the obligation resting upon us to make those efforts with reference to their receiving that blessing. But while he thus confessed the limited powers of human agency in the dispensation of life and health, he nevertheless entertained a high estimate of his profession, and regarded it as a noble art, which conferred some of the choicest blessings on mankind; and in proportion to this high estimate was his contempt for and opposition to quackery, in all its phases; and he failed not to speak in the most decided terms of disapprobation of those members admitted within the ranks of the profession who countenanced or who refused to oppose it. Dr. Hartshorne was elected a member of the Philadelphia Medical Society, in 1801; of the American Philosophical Society, in 1815, and of the College of Physicians in 1824. He was at one time a frequent attendant of the meetings of these bodies, and during his student life especially, was a useful and influential member and officer of the Philadelphia Medical Society.

HARVEY, Thomas B., of Indianapolis, Ind., was born in Clinton county, O., November 29, 1827, and died December 5, 1889. He was the son of Dr. Jesse Harvey, who taught the first school in Ohio to which colored children were

admitted. He founded an academy at Harveysburg, that State, and was a missionary among the Indians in Kansas when he died, in 1848. The elder Harvey was of English descent, a member of the Society of Friends, and his time and talents were given so freely to the poor and oppressed that there was none left for money-making. Hence the inheritance of the subject of this sketch, destined to be the future great surgeon and leader of men, was a noble mind, an honest heart, and a sound constitution, which fitted him for hard study and good work. He was compelled to practice stringent economy from his youth, but found time, nevertheless, for much reading in general literature and natural science. He began the study of medicine at the age of nineteen and graduated from the Ohio Medical College in 1851. Dr. Harvey established himself at Plainfield, Ind., where he continued in prac-

T B Harvey

tice for the period of eight years. The late Dr. Levi Ritter, afterward a leading member of the Indianapolis bar, was the only other physician of that locality, and he has written of his colleague and friend as follows: "A more perfect gentleman, professionally, I have never met in either law or medicine. In the sick-room he was the model physician; he studied to gain the confidence of the patients, nurses and friends, and his presence was a healing balm in those many cases where the mind and disposition required treatment as well as the body. I was present with him at his first major operation—amputation of the thigh—and have seen him operate many times since, and can bear testimony to his nerve and skill and to that rare confidence which led him not to be embarrassed when unforeseen complications arose. Dr. Harvey excelled in sympathy, and this was one of his strong holds on his patients. I remember a family in which poverty came from the death of the husband, and sickness followed, in which he

not only visited the sick widow, but would leave a bill folded in the prescription, to purchase food and medicine." In Plainfield, Dr. Harvey married Miss Delitha Butler. When the War of the Rebellion came, he was made Examining Surgeon for the Central District of Indiana, and he then became a citizen of Indianapolis. A contemporary says: "The war swept by, but before the close, none of the hundreds who had been called to the military center were better known than Dr. Harvey. He was of commanding presence; his personal appearance, an exponent of the man within, was as perfect, physically, and as handsome as the typical Greek. His frame was large and his face expressed kindness, strength and intelligence. He attracted attention in any audience without speaking, and when he spoke, all ears were strained to hear the cadence that fell as music on the air. And with all these natural gifts, he was always a modest man, wholly without ostentation and without the least admixture of pride or professional jealousy." Dr. Harvey was by nature and inheritance a teacher. In 1869, when the Indiana Medical College was organized, he was elected to the Chair of Medical and Surgical Diseases of Women, which he held to the day of his death. In the palmy days of the college it was no uncommon thing for Dr. Harvey to hold a clinic for hours, comprising the whole range of medical diseases. His clinics at the City Dispensary for Women were never neglected, nor at the City Hospital, where, every Wednesday for twenty-five years, he was in attendance, attracting always a large concourse of students. He was an all-around practitioner, and was frequently called as consultant in general practice. His own practice, both in his office and out, was very large, and was attended to with great fidelity, both at night and day. He was a great friend and great help to other doctors, both in their practice and in cases where they required personally his professional skill. Dr. Harvey was the chief spirit in organizing the Hendricks County Medical Society in his adopted State, read the first paper before it, and was subsequently its president. He was the first president of the Indianapolis Academy of Medicine; afterward merged into the Marion County Medical Society. He was a member of the Indiana State Medical Society, and its president in 1880, as well as a delegate from the same to the International Medical Congress of 1888. He was a member of the American Medical Association and of the Mississippi Valley Medical Society. In 1886 the State University of Indiana conferred upon him the degree of LL. D., in recognition of his eminent professional attainments. He was the author of numerous papers on professional topics read before the societies to which he belonged. He died from a stroke of apoplexy while delivering his last lecture before the Medical College of Indiana. The medical, as well as the daily press, paid most hearty tribute to Dr. Harvey's worth at the time of his death. He was given high rank, both as a man and as a physician and surgeon, and conceded much credit for his efforts in building up medical education and the standard of the profession. His funeral was attended by the members of his local medical society in a body, and also by many eminent medical men of Indiana and of other States.

HATFIELD, Marcus Patten, of Chicago, Ill., was born February 20, 1849, and received his general education at the Flushing Institute and the Wesleyan University, graduating from the latter in 1870. He then studied medicine at the Northwestern University Medical School, from which he received his medical degree in 1872. During the year of his graduation and the succeeding one, he served as "interne" or resident physician to the Mercy Hospital of Chicago. He then supplemented his medical education and training by visiting Europe, and pursued his studies for the period of two years in the principal schools and hospitals of Berlin and London. On his return from abroad he established himself in Chicago where he now resides. Dr. Hatfield is a member of the faculty of the Chicago Medical College and was for several years Pro-

Marcus P. Hatfield

fessor of Chemistry and Toxicology in that institution. He is a recognized authority in that specialty and has on numerous occasions been called into court to testify as chemical expert. He has recently been made Professor of diseases of children in the Chicago Medical College. Dr. Hatfield is a member of the Chicago Society of Physicians and Surgeons, of the American Association for the Advancement of Science, and of the American Medical Association. He was commissioner from Illinois to the Vienna Exposition. He married the youngest and accomplished daughter of Bishop W. L. Harris, of the Methodist Episcopal Church.

HAWES, Jesse, of Greeley, Col., was born in Corinna, Me., in August, 1843. There he was prepared to enter the literary department of Bowdoin College, when business affairs caused a removal of the family to Belvidere, Ill., shortly before the beginning of the Rebellion. Leaving the anticipated collegiate

course at the call of a more urgent duty, he joined the Union army in the summer of 1861, and served there until the close of the war,

Jesse Harvey.

being wounded in 1862 and a prisoner most of the last year. Returning home, he immediately entered the University of Michigan and graduated thence in 1868. In 1871 he graduated from Long Island Hospital College, after which he made a short visit to Great Britain, and on his return entered upon the practice of medicine at Greeley, Col. Here he has won a high rank among the medical men of the State. His writings, published in various medical journals and in the transactions of the State Society, dealing chiefly with surgical matters, are characterized by marked clearness and force. He has been a trustee of the Colorado State Normal School since its creation by the Legislature. He is an ex-president of the Colorado State Medical Society, an ex-president of the Colorado Board of Medical Examiners, a vice-president of the American Medical Association, a member of the State Board of Health, and an Adjunct Professor of Obstetrics in the Denver University. In 1874 he was married to Clementine S. Rockwell; their only living child is a daughter.

HAYDEN, Anexamander M., of Evansville, Ind., was born in Shenendoah Valley, Va., May 28, 1852, and is the son of Dr. A. B. Hayden and Louisa (Thompson) Hayden, and on his mother's side is of German descent. His early education was secured at the country schools of his native county. Later he finished his literary education at Winchester Seminary, Frederick county, Va. He commenced the study of medicine in his father's office at the age of eighteen and completed his medical education at Starling Medical College, whence he graduated M. D. in March, 1876. Then he came directly to Evansville, Ind., where he has been in the practice of medicine and surgery ever since. In 1884 he spent sev-

eral months in the New York Polyclinic, where he paid special attention to general surgery and gynecology. In 1890 he took a special course in abdominal surgery and gynecology at the Chicago Polyclinic. He has devoted his time almost exclusively to the practice of general surgery and gynecology and has achieved results second to none in the country, having performed forty-five ovariectomies with a single death, and one hundred and twenty-five cystotomies with no deaths. In the year 1882 he was appointed Professor of Genito-Urinary Surgery in the Hospital Medical College of Evansville, Ind., and filled that chair until the college closed in 1885. For this position he was well qualified, having made the study of genito-urinary surgery a specialty, and the discharge of his duties was eminently satisfactory. In 1882 he was appointed on the staff of St. Mary's Hospital as visiting physician which position he filled for six years with credit to himself and the institution. In 1888 he was appointed surgeon-in-chief, which position he has held ever since. Dr. Hayden has met with great success; his ability as a surgeon has been recognized, and his wonderful achievements in that line have caused him to be considered one of the most prominent surgeons of Southern Indiana. He has also contributed numerous articles to the leading medical publications of the United States. Among the most important are: "Indications for removal of Uterine Appendages, with Reports of Cases," "Excision of Wrist

A. M. Hayden.

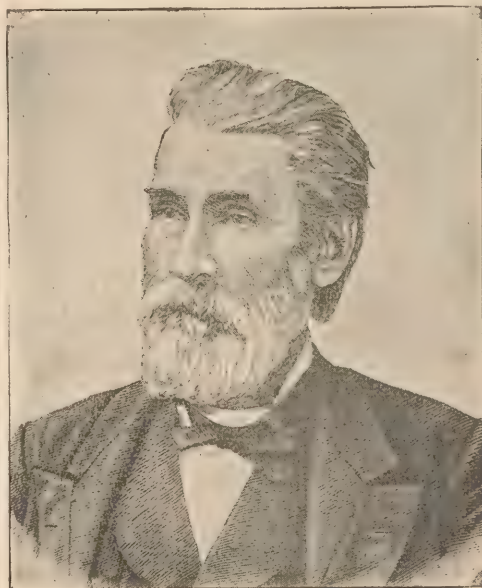

Joint for Tubercular Disease of Bone," "Congenital Deformity of Heart," "Cases of Ovarian Tumor Operations," "Nature and Treatment of Chancroid."

HAYES, Isaac Israel, of New York City, was born in Chester, Pa., in 1832, and died December 17, 1881. After a general education he studied medicine, attended the University of Pennsylvania, and was graduated M. D., from that institution in 1853. "During his studies he had become interested in the writ-

ings and intentions of Dr. Kane and tendered him his services. In the latter part of May, 1853, he was appointed surgeon of the second Grinnell expedition (better known from its commander as the Kane expedition) in search of Sir John Franklin in the Arctic regions. Dr. Hayes sailed in the brig *Advance*, and proved an energetic and valuable coadjutor of Kane. In addition to his duties as surgeon and naturalist, he made a short trip on the *Glacier*, inland from Van Rensselaer harbor and assisted in laying out depots in the autumn of 1853. In May, 1854, he crossed Kane Sea, and was the first civilized man to place foot on Grinnell Land, along the coast of which he traveled to Cape Frazer, about 79° 45' north latitude." The "*Advance*" was frozen in on September 9, 1853, and remained so in the summer of 1854. Dr. Kane turned toward Beechy Island by boat for assistance, but was obliged by the condition of the ice to return to his old winter quarters. On August 28, 1854, Dr. Hayes and eight others left the "*Advance*" in a hazardous attempt to reach Upernavik. An account of the trip is to be found in "*An Arctic Boat Journey*," 1860, wherein Dr. Hayes justifies leaving the ship. "The journey was taken by Dr. Kane's permission, but this was given only after he had advised Hayes to forego the project, and exacted a renunciation of all claims on those left behind. The boat party reached a point sixteen miles South of Cape Parry, where they were stopped by ice, and dragged out a miserable existence aided by the charity of the Etah Esquimaux until December, when they returned nearly frozen and starving. In the summer of 1854 the entire party under Dr. Kane by sledge and boat reached Upernavik safely." On July 7, 1860, Dr. Hayes sailed in command of the "*United States*" which had been fitted out by public subscription for exploration of the open polar sea. He wintered in Foulke Fiord, latitude 78° 18' north, near Littleton island. In May, 1861, he crossed Kane Sea, again set foot on Grinnell Land, attaining on May 18 a point which he called Cape Lieber, and which his observations placed in latitude 81° 35' north, longitude 70° 30' west. His various official observations and personal accounts are not entirely consistent in this respect. Competent explorers who have since visited Kennedy Channel surmise that his latitudes were incorrect and that his farthest point was Cape Joseph Good, about latitude 80° 15' north, longitude 70° west. The "open polar sea" was doubtless the Southern part of Kennedy Channel which opens early every year. Breaking out of his ship on July 10, 1861, an unprecedented early date for an Arctic vessel, he explored a considerable part of the eastern shore of Ellesmere's Land, being the first known white man to land thereon. In 1869 Hayes again entered the Arctic circle, visiting Greenland with the artist William Bradford in the "*Panther*." For his Arctic work Dr. Hayes received the founders' medal of the Royal Geographical Society in 1867, and the gold medal of the Paris Society in 1869, and was made an honorary member of many scientific societies in the United States and Europe. He returned from his second expedition to find the Civil War begun, immediately sought service, was commissioned surgeon of volunteers, April 4, 1862, and was brevetted lieutenant-colonel March 13, 1865. He resigned

July 3, 1865, and removed to New York City, where he was elected to the assembly, serving five years (from 1876 to 1880) and was each year on important committees of the House. As a lecturer he was heartily welcomed by large and appreciative audiences. Dr. Hayes is said to have possessed the essential qualities of a successful man, being quick witted, industrious, nervous, energetic and versatile, he spoke well, wrote better, and understood his subjects, and therefore won a wide reputation, not only as an explorer, but as an author, lecturer, surgeon and legislator. In addition to the work above referred to he published "*The Open Polar Sea*," giving an account of his second expedition, 1867; "*Cast Away in the Cold, a Story of Arctic Adventure for Boys*," 1868; and "*The Land of Desolation*," 1871; the latter work describing his third voyage.

HAYMOND, William S., of Indianapolis, Ind., was born near Clarksborough, that State, February 20, 1826, and died December 24, 1885.

W S Haymond

He was of English descent, and his early education was gained in Harrison county, Ind., in a log school-house of primitive construction. These limited opportunities stimulated a desire for further study and the possession of a greater number of books than were then at his command. He, at the age of eighteen, commenced teaching, meanwhile pursuing his study and becoming proficient in the science of mathematics. For a limited period, surveying and engineering engaged his time and energies, after which, at the age of twenty-three, he began the study of medicine at Clarksburg, Va., under the preceptorship of Dr. John Edmondson, of that place. He attended two courses of lectures at the Medical College of Cincinnati, and later became a student of the Bellevue Hospital Medical College, New York,

graduating from both these institutions. He chose Monticello, Ind., as an advantageous point for a young practitioner, and having met with success in his profession, remained thus located until 1877. Dr. Haymond soon took rank among the leading physicians of his county and established a reputation for skill in surgery, to which branch of practice he devoted special attention. He served during the War of the Rebellion as assistant surgeon of the Forty-sixth Indiana Infantry, and was for weeks stationed at Fort Pillow. During his service he was on several occasions detailed for important duty at general hospitals. He was in 1874, as a Democrat, elected a member of the Forty-fourth Congress, and served on the Committee on Banking and Currency, bringing much financial ability and judgment to bear in the discharge of his duties. He distinguished himself as an orator, his eulogy on the death of Speaker Kerr having been pronounced the finest literary effort of the occasion. Other speeches on the subject of finance, internal improvements and various important questions of public interest attracted marked attention. He contributed many able and valuable papers to medical journals on subjects of peculiar interest to the profession. His range of study outside the domain of medicine was not confined to the sciences and mathematics, but included in its scope the languages, in several of which he was proficient. Dr. Haymond was a member of all the important medical societies of his State. He aided in the organization of the Central College of Physicians and Surgeons, Indianapolis, in 1879, and was made Professor of the Principles and Practice of Surgery, and Dean of the Faculty. He was noted for his eloquence, wit and inimitable drollery, while his ability as a didactic lecturer was second to that of no other teacher in this country.

HAYS, I. Minis, of Philadelphia, Pa., was born in that city July 26, 1847. He was educated at the University of Pennsylvania and received its degree of B. A. in 1866, of M. D. in 1868, and of M. A. in 1869. Was editor of the *Medical News*, from its beginning as a weekly periodical in 1882, to October, 1889, and was associated with his father, the late Dr. Isaac Hays, as editor of the *American Journal of the Medical Sciences*, from 1869 to his death, in April, 1879, and was sole editor from that date to July, 1890. He was Secretary-General of the International Medical Congress, held at Philadelphia in 1876. He is a member of the College of Physicians of Philadelphia, and chairman of its library committee; is an original member and recorder of the Association of American Physicians, and is a member of the American Philosophical Society.

HEATH, Frederic Carroll, of Indianapolis, Ind., was born in Gardiner, Me., January 19, 1857. His father, editor and publisher of the *Gardiner Home Journal*, was killed at the battle of Fredericksburg, the Grand Army Post at Gardiner being named in his honor. His grandfather was a physician of wide reputation in the State of Maine. Dr. Heath prepared for college in the schools of Gardiner, and graduated at Amherst College in 1878, receiving the degree of A. M. a few years later. At the close of Junior year he won the Hutchins prize for best examinations in the Greek of Sophomore and Junior years, and was ap-

pointed to Phi Beta Kappa Society for high general rank. After teaching a few years as principal of Granby High School, Gardiner Grammar School and Washington Academy, he entered the medical department of Bowdoin College, graduating in 1884 at the head of his class and delivering a valedictory address that was published in whole or in part in some of the leading papers of the State. The following two years he served as Steward and Acting Assistant Surgeon United States Marine Hospital Service at Portland, Me., and in 1886 became an assistant surgeon, ranking first among a large class of applicants before the examining board at Washington, D. C., and serving at Chicago, Mobile, Buffalo, Cleveland and Detroit. In 1890 he resigned to enter upon the practice of his specialty (eye and ear), to which he had previously given considerable attention, taking a long course of clinical work and study in the post-graduate schools and eye and ear hospitals of New York, and locating at La Fayette, Ind., where he was soon made Oculist and Aurist to St. Elizabeth's Hospital. He removed to Indianapolis in October, 1891, where he has been gradually acquiring a constantly increasing amount of confidence and support from the profession and public, and is now Eye and Ear Surgeon to the Indianapolis Polyclinique. He is an earnest worker in medical societies, and a contributor to medical journals. Among his papers are the following: "A Case of Aneurism of the Pulmonary Artery;" "Two Interesting Cases of Enteric Fever;" "Heart Tonics;" "The Physician's First Indication;" "Nasal Reflexes;" "Gonorrhoeal Ophthalmia;" "Steel in the Iris for Twenty-seven Years;" "Benefits and Evils of Glasses;" "The Eye in Relation to General Disease;" "Medical Harmony;" "Practical Suggestions to the General Practitioner in Ear Troubles;" "The Pathogeny of Sympathetic Ophthalmia."

HEKTOEN, Ludvig, of Chicago, Ill., was born in Wisconsin, July 2, 1863, of Norwegian parents. He graduated as B. A. from Luther College, Decorah, Iowa, in 1883, and took a special course in the University of Wisconsin in 1883-84. He graduated from the College of Physicians and Surgeons in Chicago, 1887; and was the recipient of the faculty prize awarded to the highest competitor in examination for position as interne in Cook County Hospital. He was Assistant Physician to the Illinois Eastern Hospital for Insane at Kankakee, from March to October, 1887; was interne in Cook County Hospital from October, 1887, to April, 1889; was appointed Pathologist to Cook County Hospital in January, 1889, and has been reappointed each successive year; and has occupied the position of Lecturer on Pathological Anatomy and Histology in Rush College from 1889 to 1891. In 1891 he became Professor of Pathology in the College of Physicians and Surgeons, and Woman's Medical College of Chicago. In 1892 he became Adjunct Professor of Medicine in the first named institution. He was appointed physician to the coroner's office of Cook county in 1890, which appointment he held until December, 1892. He is a member of many medical societies, and a frequent contributor to medical journals.

HENDERSON, Ernest Lacy, of Kansas City, Mo., was born in New London, Howard county, Ind., September 3, 1858, and is of Scotch-Irish descent, Dr. J. F. Henderson, an emi-

nent army surgeon, being his father. His early education was that of public and private schools, Bryant College and the Kokomo, Ind., normal school. He served an apprenticeship in a printing office and filled all positions from the "devil" up to editor; this was before the age of twenty, at which time he began the study of medicine with his preceptor, Dr. W. K. Mavity, of Kokomo, Ind. Having had a year's previous study under his preceptor, he matriculated at the Ohio Medical College, of Cincinnati, O., and graduated there some two years later (in 1881), with honors. Dr. Henderson was a favorable contestant in Prof. Dawson's bandaging contest, before three hundred students and physicians at the Good Samaritan Hospital in Cincinnati, O. Upon the convening of the alumni of the Ohio Medical College, he was elected a member of

Ernest L. Henderson.

the executive committee, an honor conferred upon only three out of a class of one hundred and five. After graduation he returned to Kokomo, and entered active general practice. Scarcely had he swung his shingle to the breezes, in the office of his preceptor, than he assumed the laborious city practice, including the medical and surgical practice for the jail, city station, poor farm and orphan's home. After being in practice not over six months, he was elected a member of the Board of Health, which board upon convening elected the subject of this sketch secretary, upon whom involved the entire duties of the board. He, however, remained in Indiana less than a year, resigning his offices and practice to locate in that Western metropolis of phenomenal growth, Kansas City, in which place he has since been in continuous practice. Before leaving Indiana he was an active member of the Kokomo Academy of Medicine, the Howard County Medical Society and the Indiana State Medical Society. When a delegate

to the latter he offered a prize for the best essay by any of its members upon "Tuberculous Pulmonitis." The father of Dr. Henderson was surgeon of the medical department of Tennessee during the war, and from him no doubt he has received much instruction and his desire for research. While at medical college he not only attended the Good Samaritan Hospital, but was regularly at the Cincinnati Hospital and others of that city. Upon his advent in Kansas City, he decided that his research and practice could be more thorough if a specialty was followed, and upon this dictation he entered the special practice on cutaneous and venereal diseases, and has since discarded other practice entirely. His success has been extraordinary and he numbers among his patients residents of many States, directed to him by brother physicians. All operations in surgery coming under his specialty he has performed with much success. While his practice is large, his loss by death has been phenomenally small; he having issued but one death certificate in over ten years. Much interest is taken in collateral sciences, his laboratory for personal experiments is equipped with many new and costly instruments. His library, both that of his office and residence, are stocked with choice medical and scientific works. He devised an urethral bougie and in 1890 he gave to the profession the treatment of urethral stricture by injections, which in time must supersede the old methods of treatment. Upon this treatment he labored for many years, but now he has the applause of the profession for his perseverance. His articles in the leading medical journals in 1888 upon the local and constitutional treatment of primary and secondary syphilis created much discussion and praise for new thoughts and scientific research. Much of his practice is now devoted to consultations with physicians in and about Kansas City. He is now a member of the Kansas City Medical and Surgical Society and framed its constitution. Dr. Henderson has now in preparation two most valuable works: "The Radical Cure of Syphilis—Primary, Secondary and Tertiary," and "The Physician's Compendium of Practice. His work "The Radical Cure of Urethral Stricture" will soon be in press. He has been consulting physician to many charitable institutions; medical director of the Trans-Mississippi Life Insurance Company and medical examiner for the Order of A. O. U. W. He has done much in his profession and is a hard student and a close observer. 'Tis said; "that the oil in his lamp burns late in his study—always."

HENSKE, Andrew A., of St. Louis, Mo., was born January 2, 1852, in Marburg, Germany, where he received his collegiate education. He studied philosophy at Muenster, Germany; received the degree of Master of Arts at St. Francis Xavier University of the City of New York; Bachelor of Philosophy at St. Louis University, and graduated as M. D. at the medical department of University of the City of New York, 1877. He attended lectures at the medical department of Harvard University, 1877, and visited Berlin, Germany, 1876. He was Physician to the Home of the Little Sisters of the Poor for the Aged, from 1878 to 1882, and Physician in charge of the St. Ann's Lying-in Hospital and Infant Asylum, from 1879 up to the present time. He was

Professor of Gynecology and Clinical Obstetrics at the St. Louis College of Physicians and Surgeons, from 1885 up to the present time, and at the same time Professor of Anatomy and Operative Midwifery at the St. Louis College of Midwifery; also Consulting Physician to the City and Female Hospital. Dr. Henske has practiced medicine in the city of St. Louis since October, 1877.

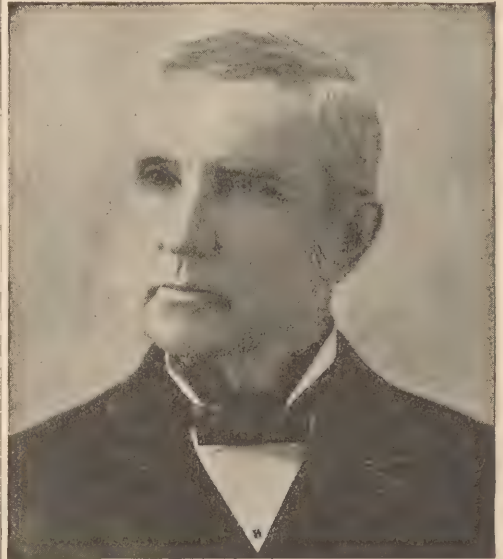

HERVEY, James Walter, of Indianapolis, Ind., was born near Brookville, that State, April 5, 1819. He descended from Scotch and Irish ancestry, the Browns and Herveys, old Scotch families. His mother was a Wayland. The Waylands were a thrifty family and early settlers in Virginia. He has been in the active practice of his profession over fifty years and is still a diligent student and a persevering investigator. While he was quite young his family moved to Butler county, Ohio, where he received a common school education. He then spent two years under the instruction of Professor Kemper, which completed his primary education. His preceptor was Dr. John C. Fall, of Lewisburg, O., in whose office he remained four years, at the same time having access to the libraries of Professor Baker, of Cincinnati, and Dr. Christian Saylor, of Winchester. He then spent a year in the office of Dr. Miller, of Fairfield, Ind., where he had access to the splendid library of Dr. William Crookshank. He was very anxious to attend college but lacked the means, and was therefore compelled to commence practice. With such text-books as he was able to secure he located in Hancock county, Ind. His first office was situated where the little village of Mount Comfort now stands. Soon after entering upon the duties of his profession, a severe and dangerous form of malarial fever spread through the country. The old physicians then practicing in the community designated the disease "congestive fever," and treated it by emetics, calomel, jalap and venesection. A large per cent. of their cases terminated fatally. Dr. Hervey here made the first innovations on established usages in that section. Borrowing money he purchased several ounces (16) of quinine and commenced using it in large doses. It was prophesied that he would kill his patients; the result, however, failed to bear out the prophecy as nearly every case recovered and the Doctor soon had more than he could do. He was called the "Boy Doctor" on account of his youthful appearance. After a time a malignant form of erysipelas appeared, attacking the face and scalp, and not infrequently the tongue. Some of the local physicians applied to it the name of "black tongue," after a symptom. Dr. Hervey applied the new theory to his cases with a success that induced others to adopt his plan of treatment. Strange to say that on the disappearance of this disease an epidemic of small-pox appeared which seemed to be modified by an erysipelatous diathesis. The saving of the vital forces succeeded in the treatment of this formidable disease and saved many lives that under the old method of treatment would have been sacrificed. Dr. Hervey treated eighty-one cases with but a slight mortality. Every case that was bled or otherwise debilitated had a fatal termination. The Doctor claims to have taken part in bringing about a change that has done much good. Other incidents occurred during this time to demonstrate that the successful practitioner

must come to the bedside of the sick armed with a different therapy from that the old authors had recommended. While engaged in practice at Mount Comfort an incident occurred that came near costing the Doctor his life by a night ride alone with a maniac. The details, which are too long for this sketch, were published in the *Hancock Democrat* and other papers. Dr. Hervey was sued for malpractice for using tincture of iodine and nitrate of silver to prevent pitting in small-pox. He was vindicated, however, and afterward complimented for his work. An account of the case was published in the *Indiana Medical Journal*, also in the history of Hancock county. Dr. Hervey remained five years where he first located, buffeting the inconveniences of a country practice. He rode hundreds of miles through the woods and swamps on horseback; this was before the time of turnpikes and railroads. He visited Indianapolis very often, where he had access to the libraries of Drs. Dunlap and Bobbs, to whom he often resorted for counsel and advice, and who manifested much interest in his success. He graduated in 1850, in the Medical Department of Asbury University. He then moved from Hancock county to the village of Oakland, located in the northeast part of Marion county, near where the counties of Marion, Hamilton, and Hancock join corners. This being remote from any medical association Dr. Hervey was instrumental in organizing a medical society which held monthly meetings at Oakland. He was elected the first president of the society, which organization continued until the War of the Rebellion. In 1854 Dr. Hervey was elected a member of the legislature. He hoped to secure some standard of qualification for a physician. During the time he remained at Oakland, he performed many important surgical operations that were never reported. Surgeons then were few and remote and he did the most of the surgery for five years. In 1858 he wrote the "Scroll and Locket," or "The Maniac of the Mound," a temperance story that was widely circulated. There is still a copy of the story in the Indianapolis public library. When the war broke out Dr. Hervey offered his services to Gov. Morton who assigned him to the Fiftieth Indiana Volunteer Infantry, as first assistant surgeon with the rank of captain. He remained with the regiment through all its marches and battles until February 3, 1863. At Parker's Crossroads he was injured by a falling hospital, which disability caused him to return to Indianapolis. He soon reported to the medical director for duty, and was assigned to Burnside Barracks at that city as surgeon in charge and acting assistant surgeon United States Army, where he remained until the close of the war. He then moved to his present location, where he has since resided. He has worked earnestly for higher attainments in medical literature, and a wider range of usefulness. He has been a member of the Indiana State Medical Society from its first organization. He has contributed many papers to its literature, among which are the following: "Utility of Forces in Diagnosing and Treating Diseases," 1873; "How to Procure Medical Legislation," 1875; "The Necessity of a State Board of Health and How to Obtain It," 1876; "Public Hygiene and its Importance in Maintaining Public Health,"

1879; and "Mental Hygiene—the Influence of the Body on the Mind; How to Elevate Manhood," 1881. Dr. Hervey became an active member of the Marion County Medical Society and contributed to its literature papers on the leading inquiries before the medical profession. He has always taken an active part in the health affairs of the city. He was appointed by the county society a member of a committee to investigate the city's water supply, also a chairman of a committee which investigated the hygiene of the public schools of the city. He is a member of the American Medical Association and generally attends its annual meetings; has also contributed some literature to the journal of the association. Dr. Hervey took an active part in the public health work and in procuring a public health department. Finding it could not be consummated without educating public sentiment, he wrote fully a hundred articles to the different secular newspapers and journals. He was made a member of the State Health Commission by the State Medical Society in 1878, in which capacity he served until the State Board of Health was secured. He spent much time in advancing public health interests for which he neither asked nor received any pay. Among the papers written while a member of the State Health Commission, we may mention those entitled as follows: "Influence of Popular Customs and Habits on the Manhood and Virtue of the Community," which was published in 1879 in the report of the State Bureau of Statistics. Also in 1880 "Heredit and the Detrimental Effect of Improper Marriages;" on the "Hygiene of the Household." In 1883 he read a paper before the State Sanitary Society held at Seymour, Ind., on the "Influence of Popular Usages and Custom on the Public Health," which was published in the *Sanitarium* edited by Prof. Bill of New York City. In 1888 Dr. Hervey was chosen by the historians of Hancock county, King and Binford, to write the history of medical men and the practice of medicine and surgery in Hancock county, which duty he performed to the entire satisfaction of every member of the profession. Dr. Hervey is a member of the International Medical Congress and of the American Public Health Association. He has two medals from the International Medical Congress. One from the meeting at Washington, D. C., in 1887, and one from the last meeting held in Berlin, Germany. While visiting this congress he visited most of the noted medical centers in Europe. For several years he has been studying diseases of the heart and has constructed a sphygmometer for diagnosing disease of this organ. He has long contended that some appliance can be constructed by which a more accurate opinion can be formed of the condition of the heart and the performance of its functions, and the long list of fatalities from heart failure shortened. He is now completing his instrument, which he thinks will give with mathematical accuracy the force, frequency, volume and regularity, as well as the elasticity of the pulse. He has exhibited this instrument before the Marion County Medical Society. He exhibited a model of this appliance to some of the delegates at the International Congress at Berlin, most of whom expressed a belief that it would be of great value in investigations of this wonderful organ, and

encouraged him to complete the instrument. Dr. Hervey's biography has been published in "Boys in Blue, or Those I Have Met," by Samuel Harden of Anderson, Ind. The Doctor has been a newspaper correspondent for many years and has expressed an opinion on all the leading questions of the day. He was president of the Historical Society of Marion, Madison, Hancock and Hamilton counties for twenty years. He has, however, made all his thoughts bend to the demands of his profession.

HIBBERD, James Farquhar, of Richmond, Ind., is of English-Quaker ancestry, and was born at Monrovia, Frederick county, Md., November 4, 1816. From his tenth to his twentieth year he lived with his uncle, Aaron Hibberd, in Berkeley county, Va., attending village school, laboring on a farm and in a woolen mill, and, later, taking a course in the Hallowell Classical School, Alexandria, Va. Choosing the medical profession, he read with his cousin, Dr. Aaron Wright, a year, attending

James F. Hibberd.

medical lectures in 1839-40 at Yale College, and August 14, 1840, began practicing at Salem, O. In 1849 Dr. Hibberd graduated from the College of Physicians and Surgeons, New York, and was at once made surgeon of the steamship Senator, from New York to San Francisco, touching at all intermediate South American ports, the voyage consuming seven and one-half months, and conferring on Dr. Hibberd the title of a "Forty-niner." He remained in California until 1855, practicing medicine and engaging in business, with financial success. The fall and winter of 1855-56 he spent in New York, renewing his medical studies. In June, 1856, he opened an office in Dayton, O., but in four months removed to Richmond, Ind., where he has been established continuously for thirty-seven years, building up a large and lucrative practice. During the session of 1860-61 he filled the Chair of Physiology and General Pathology in the Ohio Medical College, Cincinnati. Dr. Hibberd assisted, early in his professional career, in the forma-

tion of the Ohio State Medical Society, and is one of the chief organizers of the Indiana State Medical Society and of the Wayne County Medical Society, of his adopted State. He has been a member, in brief, among the earliest of the city, county, district, State and tri-State medical societies, as well as the Rocky Mountain and American Medical Associations, and has been president of all save the latter, of which he was first vice-president in 1865, and now, 1893, after thirty years' continuous and efficient service as a member, the association honors itself and him and the great State of Indiana, rapidly becoming the "Mother of Presidents," by electing the subject of this sketch to its presidential chair. It is a happy coincidence, too, says his biographer, Dr. A. W. Brayton, that the meeting over which he will preside is to be held in San Francisco, the scene of his earlier trials and triumphs. In May, 1871, Dr. Hibberd attended the California meeting of the American Medical Association, going over in seven days the distance that had occupied seven months, sixteen years before. The 123 physicians who traversed the continent with him formed, with their wives and attendant visitors, the Rocky Mountain Medical Association, entirely social and memorial in its character, meeting at the same time and place as the American Medical Association. The addresses of the various presidents and the biographical sketches of the members were collected and published, in 1877, by Dr. J. M. Toner, of Washington, D. C., and constitute the most informal and charming book yet devoted to any group of physicians in the United States. In 1863, after the battle of Stone River, Dr. Hibberd was for some time in charge of a corps of volunteer surgeons and nurses at Murfreesboro, Tenn. In 1869 he visited Europe, Asia Minor, Palestine and Egypt, being absent a year. While abroad he was a delegate of the American Medical Association at Leeds, England, and also to the International Medical Congress at Florence, Italy. During the years 1875-76 he was mayor of Richmond, and was in 1881 health officer of his county. To his efforts the State is largely indebted for the law creating a State Board of Health. Dr. Hibberd has a thorough knowledge of the science and art of medicine; he possesses rare tact and energy, as well as the most genial and social qualities, and is a welcome physician and consultant. His superior executive ability and skill as a presiding officer have been frequently exercised in cases of doubt and difficulty in the Indiana State Medical Society. His great influence in the profession has been exerted in the interests of the people by urging the necessity of increased education among medical men, and in securing laws to aid in the prevention of disease. For many years Dr. Hibberd has been the sole member of the committee on necrology of his State Society, and has collected the memorials of nearly two hundred departed members. For twenty-five years he has been a prolific contributor to the periodical medical literature of the country. He has always been an ardent supporter of the home journals, contributing many book reviews and original communications to the *American Practitioner*, formerly published simultaneously at Indianapolis and Louisville, under the editorship of Drs. T. Parvin, of Indianapolis, and D. W. Yandell, of Louisville. When the *Practitioner* was trans-

ferred to Louisville and became a Kentucky journal, Dr. Frank C. Ferguson established the *Indiana Medical Journal*, and from the first had the hearty sympathy and active support of Dr. Hibberd. In a recent conversation Dr. Ferguson expressed the belief that had Dr. Hibberd cast his lot in New York City he would have become a great medical leader and author, of the type of the elder Flint. Indiana may be congratulated that he has devoted a life-time of active pioneer work to the West, and has aided in bringing our State into the front ranks of medical progress through nearly half a century. Among his contributions to medical literature may be mentioned "Observations on Milk Sickness," 1845; "General Blood-letting in the Treatment of Inflammation," 1860, and the prize dissertation to the Massachusetts Medical Society, 1868, on "The Part taken by Nature and Time in the Cure of Disease." One of Dr. Hibberd's earliest papers before the Indiana State Society was in 1862: "Inflammation as Seen by the Light of Cellular Pathology." In 1861, while saturated with the teachings of Paget, Bennett and others touching inflammation, he received fresh from the London press a copy of Virchow's Cellular Pathology, "which threw a flood of light directly into the dark and intricate labyrinths of physiological and pathological activity, histology and morbid anatomy." Thirty years later, before the same society, Dr. Hibberd reviewed the subject of inflammation in the light of the modern pathology. This paper was published in the *Indiana Medical Journal* for June, 1892. Other papers published in this journal of late years are an important contribution to the "Symptomatology of Myxedema," in 1889, and upon "Jacksonian Epilepsy" in the May issue of that year. Politically, Dr. Hibberd has affiliated with the Whig and Republican parties. He has been an advocate of the education of woman for all the spheres of her capacity, including medicine. His parents were Friends, and his ancestry came to this country with Wm. Penn, but since manhood Dr. Hibberd has not affiliated with any sectarian organization. Of late years he has not interested himself in any of the secret fraternities, which so frequently seem a necessity to the social life of the citizen, but which the larger and more catholic natures are very prone to lay aside or outgrow. Dr. Hibberd was a friend of the late Dr. T. B. Harvey, of Indianapolis, and with him shared the honor of receiving from the Indiana State University the honorary degree of Doctor of Law. A large retinue of Richmond and Indianapolis friends, mostly physicians, attended these honorable worthies to Bloomington on a two days' pilgrimage in June of 1885, to witness the conferring by the highest educational institution in their native State this unique and unsought, but most worthily bestowed honor.

HILL, Thomas Carter, of Anniston, Ala., was born in Greene county, that State, on November 14, 1837. His literary education is very complete, having been placed under the direction of the best teachers in his native State, and at Princeton, N. J. He was graduated from the Medical College of South Carolina in 1860, after a course of three years' study in Philadelphia, New York, and Charleston, S. C. This was supplemented by a two years' course in Europe, in 1870 and 1871. At the

beginning of the late Civil War, he entered the medical service of the Confederate States, and passed through the various grades of assistant surgeon, surgeon, brigade surgeon, and Medical Director of the Valley District of Virginia. At the close of the war he returned to Alabama, where he practiced his profession, in connection with other pursuits, by which he recovered his property, which had been entirely swept away by the war. Various contributions have been made by him to the medical journals. He has always been a busy man, and has done much good by his charities and liberalities to the poor people of his city and county. He is still hard at work, and when he is called to surrender his field to the younger men of the profession, they will always have a worthy example to emulate. For many years he has held various offices of trust among his business and professional associates, and is still carrying those trusts with his usual energy and business sagacity.

HITCHCOCK, Edward, of Ithaca, N. Y., was born at Stratford, Conn., September 1, 1854, and is of English descent. He received his preliminary education at Easthampton and Amherst, Mass., and studied medicine under the preceptorship of Dr. Israel Taylor, of the latter place. He was graduated M. D. at Dartmouth Medical College, Hanover, N. H., in 1880. His medical education was supplemented by eighteen months' service in the New York City Dispensary, and with post-graduate lectures in Bellevue Medical College, New York. He practiced his profession for three years at Amherst, Mass., during which time he was an assistant in the Department of Anatomy, Physiology and Physical Culture of Amherst College. During the last nine years his whole time has been occupied as Professor of Hygiene and Physical Culture at Cornell University, Ithaca, N. Y., and in continuous research in the matter of anthropometry, with frequent contributions to periodicals of articles on that and collateral subjects. He has been vice-president of the American Academy of Medicine, secretary of the American Association for the Advancement of Physical Education, and is vice-president of the Department of the Congress of Physical Education of the Columbian Exhibition.

HOADLEY, Albert E., of Chicago, Ill., was born at Chenango Forks, in the State of New York, on the 19th day of November, 1847, of American parents. During his childhood the family moved to Illinois. After receiving his preliminary education in the schools of Amboy, he, when eighteen years old, went to Chicago and shortly afterwards entered the Chicago Medical College, from which institution he graduated in 1872. In 1876 he was married to Miss Annie E. Dicker, of Chicago. In 1888 he took a special course in surgical pathology in the Edinburgh University, Scotland. In 1881 he was elected Professor of Anatomy in the College of Physicians and Surgeons, which chair he held until 1887, when he was elected to the Chair of Orthopedic Surgery, and in 1891 Surgical Diseases of Joints and Clinical Surgery were added to the title. He was elected director of the college and president of the West Side Free Dispensary the same year. In 1885 he was one of the organizers of the Chicago Polyclinic, where he taught clinical surgery for several years. In 1886 he was made a director. In 1891 he was

appointed to the Chair of Orthopedic Surgery and Surgical Diseases of Joints. He is Attending Surgeon to the Railway Brotherhood Hos-

A. E. Hoadley

pital. He was Surgeon to Cook County Hospital from 1886 to 1890. For the year 1890 he was President of the Chicago Medical Society.

HOBBY, Cicero Mead, of Iowa City, Iowa, was born at Skaneateles, N. Y., October 16, 1848, his ancestors were all of New England origin since 1640, and five of them were in the military service during the Revolutionary War, on the American side. He was educated at the Academy in Moravia, N. Y., studied medicine with his uncle, Dr. Nelson Mead, at Locke, N. Y., and graduated from Bellevue Hospital Medical College in 1870. He began the practice of medicine in central New York, and was located for a short time at Saginaw, Mich., but removed to Iowa City in 1871, where, with the exception of two years, he has since been continuously engaged in the practice of his profession. He was married June 4, 1874, to Miss M. L. Parker, of Pittsfield, Mass. In 1875 he was appointed lecturer upon Ophthalmology and Otology in the medical department of the State University of Iowa, which position he held for fourteen years. During ten of the fourteen years he also demonstrated anatomy in the same institution. He was examining surgeon for pensions seven years, and has also been attending Surgeon to the Mercy Hospital in Iowa City. Dr. Hobby has been an active member and Secretary of the Iowa City Medical Society, and the Union District Medical Society as well as a member of the Ninth and Tenth International Medical Congresses, was elected president of the Iowa State Medical Society in 1892, and is executive president of

C. M. Nobley.

the Section of Otology in the Pan-American Medical Congress. He has furnished frequent contributions to Medical Journals, the most important being, "An Operation for Pterygium," *American Journal of Otology*, and "Cerebro Spinal Fever as a Cause of Deafness," *Transactions of the Ninth International Medical Congress*.

HODGE, Hugh Lenox, of Philadelphia, Pa., was born in that city, July 30, 1836, and died there July 10, 1881. He was a son of the late Prof. Hugh L. Hodge, the famous obstetrician, and was of Scotch-Irish descent. He was educated at private schools and at the University of Pennsylvania; graduated A. B. in 1855, and A. M. and M. D. in 1858. Dr. Hodge was for two years subsequent to the latter date Resident Physician at the Pennsylvania Hospital. In 1860 he entered upon a general practice, which in process of time he restricted to surgery and diseases of women. A year later he was appointed Demonstrator of Surgery to, and Chief of the Surgical Clinic and Dispensary of, the University of Pennsylvania, and in 1870 was appointed Demonstrator of Anatomy to the same institution. Previous to this appointment he was eminently successful as a lecturer to private classes in operative surgery. He was appointed Surgeon to the Children's Hospital in 1864; to the Presbyterian Hospital upon its opening in 1872, and was Consulting Surgeon to several other equally prominent charitable institutions. He was a member of the American Medical Association; Philadelphia County Medical, Obstetrical and Pathological Societies (being president of the latter), and a Fellow of the College of Physicians. He contributed freely to medical literature, some of his more important papers being: "Metallic Sutures;" "Tracheotomy in Cases of Pseudo-Membranous Croup;" "The Drainage of Abscesses and Wounds by Solid Metallic Probes;" "Deformities of the Hip;"

"Excisions of the Hip, of the Knee, of the Elbow, and of the Wrist;" "Ovariectomy and a New Form of Trocar for the Evacuation of Ovarian and other Abdominal Fluids," and "The Construction, Ventilation and Hygienic Management of Anatomical Rooms." During the war he was one of the Surgeons to the United States Satterlee Hospital, Philadelphia; was also attached to the Pennsylvania Reserve Corps of Surgeons, and was Pension Surgeon to the United States Sanitary Commission. Besides his hospital service, he rendered valuable service in the field at Yorktown, White House, Harrisonburg, Chambersburg, Fredericksburg and Gettysburg.

HOLMES, Edward Lorenzo, of Chicago, Ill., was born in Dedham, Mass., January 28, 1828. He graduated at Harvard College, in the class of 1849, and at the Harvard University Medical College in 1854, settling in Chicago. Soon after his establishment in that city he devoted his attention to the study and treatment of diseases of the eye and ear, and became in this line one of the most eminent specialists of the Northwest, and has held for many years the chair of Ophthalmology and Otology in the Rush Medical College, and was one of the founders of the Illinois Charitable Eye and Ear Infirmary, organized in 1858. He is a member of the Illinois State Medical Society; of the American Ophthalmological Society; of the American Otological Society, of which he was vice-president; and of the International Otological Society, of which he was also vice-president. He has contributed numerous articles to the *Chicago Medical Journal and Examiner*, and to the *Transactions of the above-mentioned societies*. Dr. Holmes was one of the victims of the great fire of Chicago, which, in a few hours, destroyed the accumulated possessions of a life-time, but it is said that his misfortune was soon retrieved by his extensive practice and skill as an oculist and aurist.

HOLMES, Oliver Wendell, of Boston, was born in Cambridge, Mass., August 29, 1809. He is a son of the Rev. Abiel Holmes, author of the "Annals of America," and Sarah, daughter of the Hon. Oliver Wendell, of Boston. He received his preparatory education at Phillips' Academy, Andover, graduated at Harvard University in 1829, and after a year's study of law entered the Harvard Medical School, from which he graduated in 1836, having previously passed several years abroad in attendance at the hospitals of Paris and other medical centers of Europe. He settled in Boston, where he still resides, though he gave up medical practice about 1849. Among the societies of which he is a member are the American Academy of Arts and Sciences, the Massachusetts Historical Society, and the Massachusetts Medical Society. In 1838 he published three "Boylston-Prize Dissertations;" in 1842, "Lectures on Homeopathy and its Kindred Delusions;" and in 1848 a "Report on Medical Literature," included in the *Transactions of the American Medical Society*. He has also published an essay on the "Contagiousness of Puerperal Fever," and in conjunction with Dr. Jacob Bigelow, an edition of Hall's "Theory and Practice of Medicine;" "Currents and Counter Currents in Medical Science," and "Border Lines in Some Provinces in Medical Science." Several of these contributions to professional literature have been reissued in one volume

with the title "Medical Essays," 1883. In 1839 and 1840 he was Professor of Anatomy and Physiology in the Medical School of Dartmouth College, and in 1847, on the resignation of Dr. John C. Warren, he was elected Parkman Professor of Anatomy and Physiology in the Medical School of Harvard University, in which he until recently still held the professorship of anatomy. The fame of Dr. Holmes as a medical author is well deserved, but his large and exquisite contributions to literature, not medical, no less reflect their splendor upon the profession. His successive volumes of poetry have borne the titles "Urania," 1846; "Astrea: the Balance of Illusions," 1850; "Songs in Many Keys," 1861; "Songs of Many Seasons," 1875; and "The Iron Gate," 1880. When the *Atlantic Monthly* was established in 1857, Dr. Holmes was one of the first contributors, and by many readers was esteemed the most brilliant of all that notable galaxy. His first contributions were in the form of a series of conversational papers entitled: "The Autocrat at the Breakfast Table," in which were included some of the finest of his poems. In addition to numerous other papers of this class, Dr. Holmes also wrote two novels, "Elsie Venner, a Romance of Destiny," 1861, and the "Guardian Angel," 1868, which are considered more remarkable as character studies than for dramatic power. Some of his other and more recent prose works are "Soundings from the Atlantic," a collection of essays, 1864; "Mechanism in Thought and Morals," 1871; "A Mortal Antipathy," 1885; and "Our Hundred Days in Europe," 1887. Dr. Holmes has been successful in every kind of literature that he has undertaken, but the "Autocrat at the Breakfast Table" is considered his most brilliant and popular work, while probably the most enduring products of his pen are his poems. In these, a critic has said, the expression is so admirably clear that the reader does not always immediately appreciate the depth of the thought. Among his serious poems, his own favorite is said to be "The Chambered Nautilus," but "The Voiceless," "Sun and Shadow" and several of his patriotic lyrics, seem to be of equal merit. Some of his satirical pieces, like "The Moral Bully," are as sharp as the most merciless critic could desire, while many of his most purely humorous ones, like "The Wonderful One-Hoss Shay," are already classic. As a poet of occasions, it is doubtful if he ever had an equal. The publishers of the *Atlantic Monthly* gave a breakfast in his honor on his seventieth birthday at which many literary celebrities were present when he read his poem "The Iron Gate" written for the occasion.

HOLT, Benjamin L., of Penn Yan, N. Y., was born in Rochester, that State, December 11, 1850. After studying medicine he attended lectures at the College of Physicians and Surgeons, New York City, and received his medical degree from that institution in 1875. Soon after his graduation he was appointed Acting Assistant Surgeon United States Army, and served in that capacity at Fort D. A. Russell, Wyoming Territory. He also served as Acting Post Surgeon at Fort Sanders, and Post Surgeon at Cheyenne Depot and at Medicine Bow. His service terminated December 11, 1876. Dr. Holt has been a member of the New York State Medical Society, and presi-

dent of Yates County Medical Society. He has also been county physician and health officer of Penn Yan; coroner of Yates county, and an assistant surgeon in the New York National Guards. He has contributed an article to medical literature on "Skin Grafting," as well as papers upon other important subjects.

HOLT, Erastus Eugene, of Portland, Me., was born in Peru, Oxford county, Me., June 1, 1849, graduated from the Medical School of Maine (Bowdoin College), June, 1874, and took an ad eundem degree from the College of Physicians and Surgeons (Columbia College), in 1875. He served as demonstrator of anatomy at the Medical School of Maine two years, and as house-surgeon of Maine General Hospital one year. After several years in general practice, Dr. Holt limited his practice to diseases of the eye and ear in which he has been a pioneer in his section of the country, having written many papers upon the subjects, which papers have been published in journals and in the transactions of various societies to which he belongs. His great work, however, in this connection has been the founding of the Maine Eye and Ear Infirmary in 1886. The new building for the permanent home of this institution is one of the best of its kind, and adorns the western part of the city. It was completed and dedicated in 1892. On this occasion, Dr. Gordon took occasion to say "that in my opinion there is no other man in the medical profession in this State who could, amid all the discouraging circumstances, have brought it to completion and united so many in its support as has Dr. Holt."

HOLTON, Henry D., of Brattleboro, Vt., was born July 24, 1838, at Rockingham, that State, where he received his academical education. He studied medicine two years with Dr. J. H. Warren, of Boston, and two years with Professors Valentine and Alex. B. Mott, of New York, attending lectures at the same time in the medical department of the University of New York, receiving his degree of M. D. from that institution in 1860. Dr. Holton first began practice in Brooklyn, and was Physician to Williamsburg Dispensary, but soon afterward removed to Putney, Vt., where he remained seven years, and finally established himself in the city of his present residence. He is a member of the Connecticut River Valley Medical Association, of which he was secretary from 1862 to 1867, and president in 1868; of the Vermont Medical Society, of which he was censor for several years, and also president in 1868; of the American Medical Association and the British Medical Association; a corresponding member of the Boston Gynecological Society and American Public Health Association, and has been a delegate to the International Medical Congress at Brussels, in 1875. He was Medical Examiner to the Vermont Asylum for the Insane, and in 1873 was elected by the Legislature one of the trustees of the University of Vermont, and has since held the Professorship of Materia Medica and General Pathology in that institution. While engaged in the general practice of medicine, Dr. Holton has devoted special attention to gynecic surgery, and obtained a wide reputation as an ovariectomist. He has devised some valuable surgical appliances and made important contributions to the medical journals of this country.

HOOPER, Philo O., of Little Rock, Ark., was born in 1833; obtained his literary education in Nashville, Tenn.; and graduated in medicine in the spring of 1856 at Jefferson Medical College, Philadelphia. Dr. Hooper was surgeon during the late war between the States, and president of the Army Medical Board for the examination of applicants for positions in the medical department of the Confederate States Army; president of the State Medical Society of Arkansas; president of the faculty of the medical department of Arkansas Industrial University, and its dean from its organization until his resignation in 1886, when he was elected Emeritus Professor of Practice of Medicine. He was first vice-president of the American Medical Association in 1882, and presided over that body with great executive and distinguished ability and delivered the annual address at its meeting at St. Paul. He was also a

Philo O. Hooper

member of the board of trustees of the American Medical Association, and president of the board for several years, and an active member in the management and conduct of its journal. And was largely instrumental in getting the first appropriation passed in the Legislature of Arkansas to erect a hospital for the insane, and was president of the board of trustees of that institution after its completion and up to 1886, when he was elected its Medical Superintendent, and now holds that position. He is also a member of the American Medico-Psychological Association, the American Medico-Legal Society, Mississippi Valley Medical Association, and honorary member of several municipal and county societies.

HORNER, Frederick, of Marshall, Va., was born at Berry's Ferry, June 26, 1828, and is of English and Scotch descent. His early educa-

tion was received at the academies of Salem and Warrenton, in his native State. His medical studies were conducted under the preceptorship of Prof. Hugh T. McGuire, of Winchester, Va., also Profs. Wm. E. Horner and H. H. Smith, of Philadelphia, and was graduated from the Academic and Medical Departments of the Universities of Virginia and Pennsylvania. He also took a post-graduate course at Jefferson Medical College and at the Philadelphia Medical College. He was commissioned an assistant surgeon of the United States Navy, in 1851, and served in this capacity and as past-assistant and acting surgeon, United States Navy, before, during, and after the war between the States, being on active duty for the period of fifteen years, and is at present retired past-assistant surgeon United States Navy. He has been engaged in medical practice in Virginia, from 1866 to 1872. His medical education has been supplemented by attending clinics at St. Thomas Hospital, London, Eng., and the Royal College of Physicians and Surgeons, as well as the leading medical schools and hospitals of Paris, France. From 1872 to 1893, his time has been mostly occupied as a medical and literary journalist and author, but also devoting special attention to the treatment of inebriety as a disease. Dr. Horner has had marked success in surgery, and in diseases of women and children. He has taken much interest in intellectual, moral and religious sciences, the practice of vaccination, and in school hygiene. He has successfully performed many important surgical operations, either reported to various medical journals or now on files of the Navy Department. In 1853-54, he was engaged in the treatment of an epidemic of yellow fever on board the United States ship Jamestown, at Rio de Janeiro and Bahia, Brazil; lost no cases, and one patient, a seaman, was rescued amid symptoms of black vomit. Again, in 1855, he took part in the management of an epidemic of this malady which prevailed at Havana, Cuba, and the cities of Portsmouth and Norfolk, Va., while surgeon of the United States ship Varina, United States coast survey, during which no cases occurred on his ship. He was a member of the board of health, to determine the character of the fever, which was fatal to many naval officers, seamen and operatives at the Norfolk Navy Yard and to hundreds of the citizens of the towns on the Atlantic coast. In 1869 he published in the *Medical and Surgical Reporter*, Philadelphia, original investigations entitled "Inebriety a Disease." His researches in this line have also been widely published in the Transactions of the New England Medical Society, State Medical Society of Virginia and in the *Journal of the American Medical Association*. He was among the first to successfully treat epilepsy with bromide of potassium. In 1873 he was appointed delegate to the International Association for the Cure of Inebriates, held in London, Eng. At the meeting of the American Medical Association at St. Louis, Mo., he was the first to propose and adopt a plan to hold the International Medical Congress at the Centennial celebration in Philadelphia, in 1876. He was one of the medical reporters from Virginia to the Second International Medical Association in America, which was held in Washington City. During the bombardment of Buenos Ayres and battle between the Buenos Ayreans and

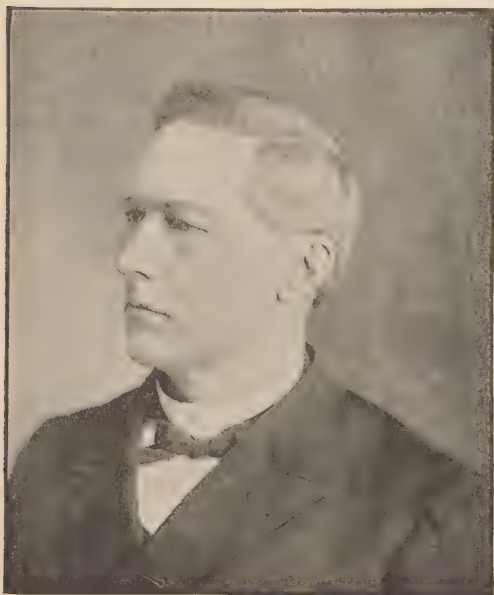

the armies of Brazil, he volunteered his services to attend the wounded. Dr. Horner was among the few naval surgeons of the Southern States who remained loyal to the Federal Union during the War of the Rebellion, and on the reorganization of the navy, in 1861, his commission of Passed Assistant Surgeon United States Navy was confirmed by President Lincoln and Congress. In 1859 he contributed to have the grog rations of the seamen of the American Navy abolished.

HORNER, William Edmonds, was born in Warrenton, Va., June 3, 1793; died in Philadelphia, Pa., March 13, 1853. His ancestry emigrated from England to Maryland before the Revolution. Dr. Horner was educated at first at the academy of Charles O'Neill at Warrenton, and afterwards at Dumfries. Upon the completion of his academic studies, in 1809, he commenced to study medicine under the direction of Dr. John Spence, a Scotch physician educated at Edinburgh. He continued the pupil of Dr. Spence until 1812, and during this period attended two sessions at the University of Pennsylvania. Anatomy was the branch that more particularly interested him, and for which he manifested the most decided partiality. In July, 1813, while an undergraduate, he entered the United States Army as a surgeon's mate, and performed his first military duty upon the Canadian frontier. In this subordinate capacity he continued to serve until the conclusion of peace with Great Britain in 1815, when he resigned. Of his adventures during this campaign he kept an interesting record and published a series of papers detailing his observations and experience in the *Medical Examiner*, of Philadelphia, as late as 1852, the year before his death. During the winter of 1813-14, having obtained a furlough, he attended the lectures in the University of Pennsylvania preparatory to his graduation, which took place April, 1814. The thesis written by him was on "Gunshot Wounds." Upon resigning from the army in 1815, after a brief sojourn in Warrenton, his native place, Dr. Horner settled in Philadelphia, and here located, we are informed by Professor Samuel Jackson, his enthusiasm for anatomy, his earnest application to dissection, his quiet demeanor, his steadiness of character, the neatness and elegance of his preparation had attracted the notice of Professor Casper Wistar and gained his friendship, confidence and esteem. In the spring of 1816 an arrangement was made with Dr. Wistar, who filled the chair of Anatomy in the University of Pennsylvania, by which Dr. Horner became his assistant in the anatomical course, preparing the subject for demonstration. By this association the demonstrations of the anatomical course were fuller and more complete than they had been previously, and the anatomical museum was rapidly increased by numerous specimens and preparations, particularly of fine injections as well as important pathological illustrations. The late Prof. Joseph Carson writes that upon the death of Dr. Wistar, in 1818, Horner engaged with Dr. Dorsey as his assistant, and when that professor was stricken down at the very beginning of his course, the engagement was renewed with Dr. Physick, who undertook the labor of delivering the anatomical lectures in addition to his own on surgery. "The course of 1818-19 was completed in a manner highly satisfactory to

Dr. Physick and the class. The assiduity and zeal of Dr. Horner and the excellence of his demonstrations, by lightening the labor of the course and facilitating its progress, contributed in no small degree to the result." For this reason, in 1820, Dr. Horner was elected adjunct professor, and upon the resignation of Dr. Physick, in 1831, became the Professor of Anatomy, and held this chair until his death, over twenty years afterwards. As a lecturer, Dr. Horner was neither fluent nor copious in language, nor had any pretensions to elocution. His plan, to a certain extent, was novel. He composed a textbook, his "Special Anatomy," which was a complete but concise treatise on anatomy. It was written in strict reference to the course of study in the University of Pennsylvania, and was kept in as compendious a state as possible, so that there should be no unnecessary loss of time in reading it. This book was, in fact, his lectures. In the lecture room he confined himself chiefly to the demonstrations of the text of his work, by dissections, preparations, drawings and models. Dr. Jackson further remarks, with respect to this plan: "On the value of the method there will be different opinions, but it is certain that he made good anatomists. I have frequently heard students declare that, plain, simple and unadorned as were the lectures of Dr. Horner, they had learned anatomy better from him than from any others they had heard lecture on that branch. The Anatomical Museum of the University, founded, as has been narrated, by Dr. Wistar, is an evidence of the great anatomical skill and untiring application of Dr. Horner. A very large portion of it, upwards of two-thirds at the time of his death, and containing most of its finest preparations, rivalling those of the best anatomical museums of Europe, was the result of his labors. Dr. Horner, from time to time, presented the preparations he had made to the University, which was acknowledged by the board of trustees, but on his death he bequeathed an extensive collection, together with all his instruments and apparatus connected with dissections, to the medical department." The trustees have, in consequence of this liberal bequest, bestowed on the collection thus constituted the name of the "Wistar and Horner Museum." These fine anatomical collections were valued at \$10,000. Dr. Horner is entitled to credit as an original observer. He determined the existence of a special muscle, situated on the posterior surface of the lachrymal duct and sac, which solved the difficulty of explanation as to the mode by which the tears were conveyed into the nose. He named the muscle *tensor tarsi*. Its existence has been verified by anatomists in this country and in Europe, where it has been called "Musculus Horneri." He was an active member of the city sanitary board during the cholera epidemic of 1832, and was presented by the citizens with a silver pitcher for his exertions. He first detected the fact that in cholera the whole of the epithelium was stripped from the small intestines, and hence the turbid rice-water dejections in that disease. This he did by making a minute injection of the mucous membrane, and then examining it by the microscope under water. Dr. Horner united with the Roman Catholic Church in 1839, and in 1847 founded St. Joseph's Hospital. In

1848 he visited Europe and was well received by scientific men. His health began to fail in 1841, and it is said that during his last years he suffered greatly, but continued his lectures till two months before his death. He left his large library to St. Joseph Hospital. Dr. Horner published several works upon anatomy. Eight editions of his "Special Anatomy and Histology" were issued between 1826 and 1851. Five editions of his "United States Dissector" were published, the last being revised by his son-in-law, the late Prof. Henry H. Smith, in 1856. The "Anatomical Atlas" is another well-known publication of Dr. Horner, and in addition to his books, he contributed many important articles to the medical periodicals of his time.

HORNIBROOK, Edward, of Cherokee, Ia., was born in Grenville county, Ontario, October 28, 1838. Parents Irish. He was educated at public schools, by private tutors, and at the

Edw. Hornibrook

University of Toronto. He graduated in medicine at Victoria College in 1861. He practiced his profession at Mitchell, Ontario, for eighteen years, and removed to Cherokee in 1879. He was an active member of the Canada and Ontario medical associations, and contributed many papers to each. He was delegated to represent the former society at the American Medical Association in 1878, and still retains his membership in the latter. He is also a member of the Iowa State, Missouri Valley, Cedar Valley and Cherokee County Associations. His contributions to medical societies and to the medical press have been chiefly records of his own experience and observations. In 1874 he published a paper upon "Empyema and Its Treatment by Aspiration and Injection of Iodine without Drainage, in Children," and in 1876 on the "Treatment of

Fractured Patella." Both were published in the *Canada Lancet* and attracted wide attention. An abstract of the latter is published in "Holmes' System of Surgery." Among his later publications may be mentioned the following papers, viz: "Pyonephrosis;" "Puncture of the Liver;" "Two Laparotomies with Peculiar Complications;" "Resection of the Tibia and Fibula;" "Pelvic Peritonitis and Pelvic Cellulitis;" and "Neurasthenia." He is now a member of the board of trustees of the Hospital for the Insane at Independence and of the Sioux City Medical College.

HOSACK, David, of New York, was born in that city, August 31, 1769, and died there December 22, 1835. From an extended memoir written by his son, Dr. A. E. Hosack, and published in the American Medical Biography, the editor has derived the following interesting extracts relating to the life, history and professional achievements of this noted pioneer physician. After receiving the ordinary education of childhood, he attended an academy at Newark, N. J., and finally, in 1786, entered Columbia College, New York, and availed himself in the meantime of instruction in the languages under private teachers. Finding his time not fully occupied during his college course, he resolved upon the study of medicine, and accordingly, in May, 1788, entered as a private pupil with the late Dr. Richard Bayley, an eminent surgeon in New York. He had scarcely begun his studies before the celebrated "Doctor's Mob" occurred, which threatened serious results to those concerned; it arose in consequence of the imprudence of some of the students carelessly pursuing dissection in the building upon the site since occupied as the New York Hospital. This mob caused many of the professors to absent themselves from the city, and others to seek shelter in the city jail. Mr. Hosack, with the rest of the students interested, learning that the mob had seized upon and demolished the anatomical preparations found in the lecture-room above referred to, repaired immediately to Columbia College, with the view of saving such specimens as were to be found in that institution. Before reaching the college, however, and when on his way to Park Place, he was knocked down by a stone striking him on the head; he would, in all probability, have been killed, had it not been for the protection he received from a neighbor of his father, Mr. Mount, who was passing at the time, and took care of him; he never saw that gentleman afterwards without feeling and expressing his gratitude to him for his kindness. In the autumn of 1788, he removed to Princeton, N. J. After being examined with the students of the college then entering into their Senior year, he was admitted into the Senior class, and was graduated Bachelor of Arts in the autumn of the succeeding year, that is, 1789. His great inducement for removing to Princeton was a desire to complete his course of collegiate studies as soon as possible, in order to devote his exclusive attention to medicine, to which he had now become ardently attached, and that he might also have the benefit of attending the valuable lectures on Moral Philosophy and Elocution delivered by the learned president of that college, the Rev. Dr. Witherspoon; those of Belles-Lettres and Composition, by the vice-president, the Rev. Dr. Samuel Stanhope Smith; and the instruc-

tion in Mathematics and Natural Philosophy, by the celebrated mathematician, Dr. Walter Minto, all of which presented attractions which he could not resist. Having finished his course at Princeton, he returned to New York, and resumed his favorite medical studies, to which he now gave his undivided attention, availing himself of every advantage which the city at that time presented. He attended the lectures on Anatomy and Physiology, delivered by Dr. Wright Post; those on Chemistry and Practice of Physic, by Dr. Nicholas Romayne; and the valuable course on Midwifery and the Diseases of Women and Children, by Dr. Bard. He also attended the practice of physic and surgery at the almshouse, which then offered the only means of clinical instruction in the city; they were, however, very ample, the house being daily visited by Dr. Post, Dr. William Moore, Dr. Romayne, and Dr. Benjamin Kissam. In the autumn of the year 1790, being desirous of obtaining all the advantages of instruction which the United States at that time afforded, he proceeded to Philadelphia, the medical school of which had already acquired great celebrity from the learning of its professors, especially Drs. Shippen, Rush, Kuhn, Wistar, and Barton. At that time a division already existed among the faculty, which led to the institution of a medical college as a rival school to that connected with the university, and not a little contributed to the benefit of both, and the ultimate advancement of the science of medicine in Philadelphia. He entered as a regular pupil, and attended all the courses of lectures delivered during the winter in the university. He also attended those delivered on the Theory and Practice of Physic by Dr. Rush, then a professor in the College of Philadelphia, as well as his clinical instructions in the Pennsylvania Hospital. In the summer of the succeeding year, after the usual private and public examination, he was admitted to the degree of Doctor of Medicine in the University of Pennsylvania, upon which occasion he duly defended an inaugural dissertation on cholera morbus, in which he endeavored to illustrate the doctrine of Dr. Kuhn on that subject, that an acid in the primæ viæ, chiefly the effect of the use of accessants, was the most usual proximate cause of that disease. Upon that subject, however, his views subsequently changed. After receiving the degree of Doctor of Medicine, Dr. Hosack returned to Princeton and married Miss Catharine Warner, a lady of great worth, to whom he had become attached while pursuing his collegiate studies. "Marriage," says Leibnitz, "is a good thing, but a wise man ought to consider of it all his life." His marrying at that early age might, perhaps, be considered indiscreet on his part, as he was without the means of supporting a family; it doubtless, however, proved an incentive to exertion. Soon after, by the advice of Dr. Rush and others whom he consulted, he removed, in the autumn of the same year, to Alexandria, in Virginia, which he then believed would, at some future day, be the capital of the United States. He took with him letters of introduction from Dr. Witherspoon and Dr. Smith, the president and vice-president of his *Alma Mater*, Princeton College, as well as from his friends and preceptors of the University of Pennsylvania. He soon acquired a considerable practice; it, however, proved insufficient for his wants.

Being dissatisfied after a year's experience, and desirous of residing near his family, he returned to New York in 1792, a step which ultimately proved very judicious. Upon commencing the practice of his profession at this time, he felt the necessity, and perceived the importance of a European education, and, as he says, "observing the distinction which our citizens at that time made between those physicians who had been educated at home and those who had had additional instruction from the universities of Europe, and knowing how little property I had reason to expect from my parents, I found that my chief dependence was upon my own industry and unceasing attention to the profession I had chosen as the means of my subsistence; my ambition to excel in my profession did not suffer me to remain insensible under such distinction. Although it was painful for me to think of leaving my family, consisting then of a wife and child, I accordingly suggested to my father the propriety of my making a visit to Europe, and of attending the medical schools of Edinburgh and London. He at once, with his characteristic liberality, acquiesced in my views and wishes. In August, 1792, leaving my family to the care of my parents, I took passage for Liverpool. The day after my arrival there I called upon Mr. William Renwick, the father of Professor Renwick, of New York, to whom I had letters of introduction; he kindly insisted upon my removal to his house, to remain with his family during my stay in Liverpool. Mr. Renwick introduced me to many of his friends in that town; among these were the late Dr. William Currie, Dr. Brendrith, Dr. Thomas Renwick and others, from whom I received many kind attentions. At the house of Dr. Brendrith I passed an evening in the society of some of the choicest spirits who at that time distinguished the town of Liverpool, and who were assembled to meet the Ayrshire poet, Burns, then on a visit there, and already becoming distinguished for his enchanting verse. After supper, the toddy passing freely round, he gratified us by singing one of his own songs. I was then but little aware of the fame that awaited him, and the distinction that his name has since acquired. From Liverpool I proceeded to Edinburgh, where I arrived in time to attend the medical lectures of the University of that city. I attended not only the lectures delivered by Dr. Monro on anatomy, Dr. Black on chemistry, Dr. Gregory on the practice of physic, Dr. Duncan on institutes, Dr. Home on materia medica, Dr. Alexander Hamilton and his son, Dr. James Hamilton, the present Professor of Midwifery; but I also attended the demonstrations in anatomy by Andrew Fyfe, the practice of the infirmary and the clinical lectures delivered during that winter in this institution by Dr. Duncan, Dr. Gregory, Dr. Home and Dr. James Hamilton, afterwards the author of the celebrated work on purgatives. I also enjoyed, in addition to the advantages I received from the professors' public courses of lectures, the benefit of much private intercourse with them and their families, especially those of Drs. Duncan, Gregory and Alexander Hamilton. At the table of Dr. Gregory, I had the gratification frequently of meeting many of the distinguished literati of Edinburgh; among these were Dr. Greenfield, the colleague of the Rev. Dr. Blair, and for some time the

reputed author of the Waverly Novels; Dr. Rotherham, Prof. Rutherford, and other gentlemen of distinction. Upon one occasion I had also the pleasure of meeting at dinner, at the house of Dr. Gregory, two of his sisters, who were then making an annual visit to their brother; these were the ladies to whom their father, Dr. John Gregory, had addressed his memorable 'Legacy to his Daughters.' In addition to the foregoing interesting characters mentioned here, many others might be cited from whom Dr. Hosack received every kindness and attention, such as Dr. Charles Stewart, a distinguished physician of Edinburgh; the Rev. Dr. Erskine, of Lauristan, and Henry Mackenzie, the author of the "Man of Feeling," at whose table he was frequently a guest. He then continues his remarks. Speaking of the learned divines, perhaps the most learned of any age, he says: "I regularly attended church, sometimes hearing sermons from Principal Robertson, at other times from Dr. Erskine, Sir Henry Moncrieff, of Wellwood, and occasionally from Dr. Blair. Dr. Robertson's discourses were distinguished for the valuable instruction they conveyed, and the dignified style and manner in which they were delivered. Dr. Erskine was remarkable for the piety and Christian fervor which pervaded his sermons, and in which they exhibited great resemblance to those published by his relatives of the same name. The most eloquent and animated preacher of Edinburgh was Sir Harry Moncrieff, whose discourses were attractive, and were always listened to with the utmost attention by a crowded audience, while those of the celebrated Dr. Blair, though sanctioned by the presence of the town council of Edinburgh, with their provost at their head, who always attended as a body with their insignia of office, and accompanied him to his church every Sabbath in a regularly formed procession, were not remarkable for any interest except as beautiful moral essays; but these even were delivered in a dull, monotonous, prosing manner, as if the speaker himself were scarcely conscious of the merits of the admirable discourses he was pronouncing; totally forgetful of the lessons so happily inculcated in his lectures on rhetoric, and so practically illustrated in his valuable papers contained in the 'Royal Edinburgh Transactions.'" In the spring of 1793, while in Scotland, he made a short tour to the north as far as Elgin, the birthplace of his father, and there met several of his relations. After his return to Edinburgh he proceeded to London, where he entered as a pupil of St. Bartholomew's Hospital, under Sir James Earle, the son-in-law and successor to the celebrated John Hunter, whose death took place at this time, and whose funeral he had the gratification of attending. He also frequently visited other hospitals, when any important surgical operations were performed, surgery being the favorite subject of his pursuit; he nevertheless did not neglect the collateral branches of medical science, as will be seen by his own statement: "Having," as he says, "upon one occasion—while walking in the garden of the Professor Hamilton, at Blandford, in the neighborhood of Edinburgh,—been very much mortified by my ignorance of botany, with which his other guests were familiarly conversant, I had resolved at that time, whenever an opportunity might offer, to

acquire a knowledge of that department of science. Such an opportunity was now presented, and I eagerly availed myself of it. The late Mr. William Curtis, author of the 'Flora Londinensis,' had at that time just completed his botanic garden at Brompton, which was arranged in such manner as to render it most instructive to those desirous of becoming acquainted with this ornamental and useful branch of a medical education. Although Mr. Curtis had for some time ceased to give lectures on botany, he very kindly undertook, at my solicitation, to instruct me in the elements of botanical science. For this purpose I visited the botanical garden daily throughout the summer, spending several hours in examining the various genera and species to be found in that establishment. I also had the benefit, once a week, of accompanying him in an excursion to the different parts of the country in the vicinity of London. Dr. William Babington, Dr. Thornton, Dr. now Sir Smith Gibbs, Dr. Hunter of New York, the Hon. Mr. Greville, and myself, composed the class in these instructive botanical excursions, in the summer of 1793. By Mr. Dickson, of Covent Garden, the celebrated cryptogamist, the '*maximus in minimis*,' as Mr. Curtis has very properly and facetiously denominated him, I was also initiated into the secrets of the cryptogamic class of plants. During my residence in London, the winters of 1793-94, I devoted myself to anatomical dissections, under the direction of that very distinguished teacher of anatomy and surgery, Dr. Andrew Marshall, of Flavel's Inn, Holborne; to chemistry, practice, and materia medica, under Dr. George Pearson, of Leicester Square; to mineralogy, as taught by Schmeisser. At the same time I daily visited the hospitals, and attended the various surgical operations which were performed during that period. I also frequently visited the Leverian Museum, having taken a ticket, which gave me the privilege of seeing and examining the precious collection of objects in natural history contained in that valuable establishment." In the midst of such diligent application and study it is not surprising that he should, as a young man, have sought recreation in the various amusements of London. Having been initiated in the excellencies of the drama while in Edinburgh, he says: "I was prepared to enjoy the superior and more numerous attractions of London, in the succeeding years of 1793-94, a period when the stage displayed a constellation of talent that has never been exceeded, if it has ever been equaled. John Kemble, and if possible his more extraordinary sister, Mrs. Siddons, Mr. and Mrs. Pope, Miss Farren, since Countess of Derby; Mrs. Eden, Mrs. Jordon, Miss De Camp, afterwards the wife of Charles Kemble; John Palmer, Parsons, Quick, Holman, King, Bannister, Munden, Suett, Faucett, and Irish Johnstone, afforded to the friends of the drama a gratification never to be forgotten; while in song and at the opera, Madame Mara, and Billington, Banti, Mrs. Crouch, Signora Storace, Incledon, Kelly, and others, fascinated the lovers of music with their most exquisite performances." These delightful amusements, however, alluring as they were, did not divert him from the more important objects of his visit to Europe. In 1794 he returned to New York in the ship Mohawk, after a passage of fifty-three days. Among his fel-

low-passengers were Mr. Thomas Law, brother of the late Lord Ellenborough, Mr. Daniel McKinnon, author of "Travels in the West Indies," and Mr. Hunter, late Senator of the United States from Rhode Island. During the voyage typhus fever made its appearance, and became very general, particularly among the steerage passengers. Dr. Hosack being the only physician on board, was called upon to exercise his professional skill in the treatment of them, in which he was singularly successful, not losing a solitary case. His services were duly appreciated by all, as was evinced by the unsolicited vote of thanks published in the daily papers. From this date commences his professional career in the city of New York. He was encouraged by his success; experiencing the benefit growing out of an intimacy formed with his fellow-passenger, Mr. Law, who, upon his arrival in this country, took pleasure in introducing him to most of his acquaintances, among whom were General Hamilton and Colonel Burr. The favorable impression he made upon the minds of these distinguished persons induced them to adopt him as their family physician. His receipt from his first year's practice, together with that derived from four private pupils, amounted to about fifteen hundred dollars, which enabled him to support his family, consisting at that time of himself and wife; his only child, a son, having died during his absence. In 1795 he was honored by being appointed to the Professorship of Botany in Columbia College, upon the duties of which he immediately entered. At the termination of the course he published a syllabus of his lectures, afterwards inserted in his "Medical Essays." In the autumn of 1795, the yellow fever made its appearance in the city of New York, and was peculiarly malignant and fatal, affording ample opportunity to young medical men to distinguish themselves. At this time he attracted the attention of Dr. Samuel Bard, an eminent physician of New York, who, forming a strong friendship for him, and with due appreciation of his talents, was induced to place him in charge of his practice during a short visit to the country. Upon his return to the city, gratified by his assiduity and attention to his patients, Dr. Bard proposed a connection with him in business preparatory to his retiring from the profession, which he did after the lapse of three or four years, leaving Dr. Hosack in the enjoyment of an extensive and profitable practice. This preference was in itself highly complimentary; not but that Dr. Hosack would have been successful in his profession with his energetic and determined character, and the distinguished friends he had already acquired. Still, the patronage of one so eminent as Dr. Bard, while it tended to confirm them in the correctness of their choice, was certainly of the greatest importance to so young a man. A feeling of affection grew out of this connection more like that of father and son. At this period of his life he became more particularly known to the community for his success in the treatment of yellow fever, which had made its appearance during four successive summers, viz: 1795, 1796, 1797 and 1798, and since in 1803, 1805, 1819 and 1822. From the extensive opportunity of observation thus afforded him, he became a strong advocate of contagion and of the foreign origin of the disease, and was the first to pursue the

sudorific and mild treatment of it, to which may be traced the successful results attendant upon his practice. To use his own language: "I have generally," he says, "pursued the sudorific treatment during every visitation of yellow fever since 1794. With due respect for the opinions and views of other practitioners, I am no less convinced of the injurious consequences to be apprehended from the indiscriminate use of the lancet and mercury in this epidemic form of fever." To quote from a biographical sketch of Dr. Hosack, published in the "National Portrait Gallery," in 1834, where the writer remarks: "The attention which Dr. Hosack paid to this disease in the years referred to, received, in a peculiar manner, the approbation of his fellow-citizens; for it was remarked of him that during those several epidemics he was always present, and thereby enjoyed the amplest opportunity of observation, and of forming correct opinions of the nature and character of the disease." In 1798 he was himself attacked with the yellow fever, and he pursued in his own case the same treatment he had so successfully employed in others. Such, too, was the public confidence in the correctness of his views and practice, that, at the request of the corporation and board of health of New York, he was frequently called upon for the express purpose of ascertaining the character of a disease, to allay thereby the anxiety of their fellow-citizens. In 1811 he was requested, as a member of a committee, to investigate the nature and trace the introduction of the yellow fever, which appeared at Amboy, in New Jersey, in that year. The report of that committee, which was communicated to De Witt Clinton, as president of the board of health, was written by Dr. Hosack. This luminous and circumstantial statement was received as a conclusive document, showing the specific character of the disease, and its communication by means of contagion, and was republished in the medical journals of Edinburgh and London, and also in the third volume of the "Medical and Philosophical Register" of New York. Upon the death of Dr. William Pitt Smith, in 1797, who held the chair of *Materia Medica* in Columbia College, Dr. Hosack was appointed to that branch, in addition to the one of botany already held by him. In this department he acquired further reputation. He continued to fill these joint professorships until 1807, when the College of Physicians and Surgeons of the State of New York was established, when he was chosen Professor of Surgery and Midwifery. He soon, however, relinquished the former for that of the theory and practice of physic and clinical medicine. By the foregoing statement, it may be observed that Dr. Hosack had already, and in so short a space of time, held these professorships, and had actually lectured upon five different branches of medical science. Referring to Dr. Hosack's qualifications as a physician and teacher, Dr. Minturn Post says: "Perhaps there is no science which requires so penetrating an intellect, so much talent and genius, so much force of mind, so much acuteness and memory, as the science of medicine." These requisites were eminently conspicuous in the character of Dr. Hosack. He now became distinguished as a general practitioner, enjoying a more extensive practice than many of his contemporaries, and among his patients may be

enumerated many of the most learned and distinguished citizens of New York. It has often been remarked that many men, though gifted with great talents, and whose fame rests upon an enduring basis, were in no degree remarkable either for conversational or oratorical powers, while in others these qualities have been happily blended. In no respect was Dr. Hosack more remarkable than as a lecturer; gifted with a commanding person and a piercing eye, of an ardent temperament, and of strong convictions, his manner of treating the various subjects connected with his professorship was at once bold, impressive, and eloquent. Occupying, during the most distinguished portion of his career, a chair—that of the theory and practice of physic and clinical medicine—which, perhaps, embraced a greater variety of subjects than any other, the scope which he gave to his observations was of the most extended character. None of the ills to which flesh is heir escaped his research, or baffled his investigation. The beautiful science of botany lent to less attractive subjects its kindred grace and classical allusion, and added a charm to a discourse already beaming with observations of the highest import to humanity. Gifted as Dr. Hosack was with a keen desire for the acquisition of knowledge, he was strongly attracted to all who exhibited an ambition to excel in the various departments of learning. He thus became intimately associated with the most remarkable men of our country, and was imbued with the spirit, the manner, and the characteristics of the most distinguished votaries of science, literature, and art. Stored as his mind thus was, he was enabled to give to subjects comparatively unattractive an interest which was imparted to them by the charm of his impressive manner. His great object was to direct the student to the importance of the subject under examination, to lead him by his eloquence, and to rivet his attention by his earnestness, and no man ever succeeded better as a public lecturer in attaining these results. Students from every part of our widely extended country were ever anxious for the hour of his lecture to arrive, and were inspired with new zeal as they listened to the eloquent teachings that fell from his lips. Dr. Hosack was a man of great and untiring industry. Numerous as his engagements were, the appointed hour found him at his desk in the lecture-room, with his notes before him. Upon many subjects connected with his branch of medical science, he held opinions which were controverted by many of his professional brethren. Upon these subjects especially his style of lecturing was conspicuous for its bold and fearless character. As a professor of the science of medicine, he was of the opinion that many of its most distinguished votaries had taken too limited a view of its nature and extent, and had founded theories which, being based upon some particular part of the system, were found, when applied to practice, to be inadequate and valueless. In his lectures, he says: "We shall not, as some have done, confine ourselves to any particular part of the body in considering the cause of disease, but shall examine the whole, and in so doing we shall adhere strictly to the inductive system to establish our facts. This was not formerly the case. Thus, Hoffman gave his whole attention to the nervous system, as

also Cullen, who attempted to explain all the phenomena of disease by the same cause; he overlooked the fluids entirely, except in diabetes, typhus, and scorbutus. Before the time of Hoffman, all was humoral pathology. Darwin resolved all by the absorbent and nervous systems; Sydenham and Boerhaave by the fluids. Rush and his followers are modifiers of the Brunonian school. But the dreams and speculations of a Darwin, and the fertile imagination of a Brown, shall have no place here. I attend to the whole circle—to the nerves, fluids, and solids; in fine, every part of the system, for every part may become the seat of disease. The principles of the practice of medicine should invariably be deduced from the structure of the body and the cause of the disease. Principles are but the assemblage and classification of facts, and are the only safeguards to practice, as has been well observed by Rush. The plan to be pursued in studying the theory and practice of medicine will be: The structure of the human frame, more especially the various functions it performs in health, including those that appertain to the mind. The natural functions of the system; the causes of disease, whether inherent in the body, or produced by the operation of external agents; the influence of climate, soil, clothing, food, sleep, and exercise; both bodily and mental; the passions of the mind; the functions peculiar to the sexes; the various trades and occupations; as also the sensible and adventitious qualities of the atmosphere in the production of endemic and epidemic diseases. How far the functions of the constitution extend their influence in overcoming or preventing disease, as ascribed to it by the ancients and some moderns, under the term of '*vis medicatrix nature*'; and the arrangement in the best order of the diseases to which the human body is subject, with their respective treatment and symptoms." The extended outline exhibited above, gave free scope to the energetic and comprehensive mind of Dr. Hosack, embracing in its outline both the primary and collateral branches of the healing art. His course was marked by an extent and variety of information, which made it singularly attractive to the young votary of science. Of an ardent and sanguine temperament, he threw his whole soul in support of the opinions he had adopted, and appeared at all times ready as their champion and defender. His advocacy of the doctrines of the humoral pathology was marked by the ardor and decision which distinguished his character. His illustrations in support of these principles, as drawn from typhus, scorbutus, and other diseases, were at once pointed, cogent, and convincing. Could he have lived to see the manner in which these doctrines have since been received by distinguished members of the profession, how great would have been his joy and satisfaction. Dr. Hosack was gifted with a fine sonorous voice, great play of expression, and a remarkable vivacity of manner, qualities which, being as it were contagious, begat in his youthful auditory a kindred sympathy, relieved from the tedious monotony of manner, which has characterized some distinguished professors of medical science—

"Pleased they listened, and were won."

In lecturing upon points of theory and practice, on which he held controverted views, he

was singularly eloquent. Gradually rising with the subject, his voice would assume a depth and power that gave evidence of the faith that was in him, while his gestures added to the effect which his discourse produced. Nor were his powers of illustration less remarkable. In lecturing upon fever, on croup, on tetanus, and scarlatina, diseases upon which he held opinions peculiar to himself, and, indeed, in advance of most of his professional brethren, the cases with which his portfolio was stored were exceedingly interesting and impressive. The general reader may form some idea of the manner in which he illustrated his subjects by the example which we subjoin. At one time during his professional career, scarlet fever prevailed in New York as an epidemic, and had attacked several of the family of General Alexander Hamilton. The General, who was in public office, was at the time absent from the city, although information was communicated to him, from time to time, in reference to the state of his family, but he was at last summoned home, by an urgent letter, informing him of the hopeless condition of one of his children. He started immediately, and after a fatiguing journey in winter, arrived during the night at his sorrowful home. He proceeded immediately to the sick-room of his child, where, to his inexpressible joy, he found his little son in a sweet sleep. Being informed of the change wrought, and of the means by which it had been effected—a spirit and ammonia bath,—refusing all importunities to take repose, the General repaired immediately to the adjoining chamber, where Dr. Hosack had retired to rest, after several fatiguing and sleepless nights. Being awakened from his slumber, what was his surprise to see the form of General Hamilton, the friend and companion of Washington, kneeling at his bedside, and returning thanks to his God for his merciful interposition. The General said, in his most impressive manner, and in accents that showed his deep emotion, that he could not lie down until he had taken him by the hand and expressed his heartfelt gratitude to him who had been a “ministering angel” in restoring his child to him. To Dr. Hosack, the interview, with the accompanying circumstances, was overwhelming, and was ever remembered by him as among the most gratifying compliments and acknowledgments he had ever received. “*Laudari laudato viro*,” must ever be, to the generous mind, the highest species of praise, and this he had indeed received. In his lectures upon scarlet fever, he always cited this interesting incident, with a view to elevate the profession, by exhibiting to students that medical science and unceasing exertions were ever duly appreciated, adding, at the same time, that “such heartfelt gratitude, thus expressed, was worth more than any pecuniary compensation whatever.” A friendship, cemented under such interesting circumstances, survived till death, and was conspicuous on every occasion; in none was it more so than when he accompanied his illustrious friend to the fatal field, when he fell in his unfortunate duel with Colonel Burr, a conflict which carried dismay to the hearts of our citizens, and which was mourned by the whole nation, as the untimely fall of a great man, who had devoted his time, his talents, and his energies to the great cause of liberty. It will be easily perceived that a

course of lectures, illustrated by cases so interesting and instructive, would be highly attractive to the youthful student, and was eminently calculated to cheer him onward in the rugged path of his professional career; but when we add to these his clear voice, his gestures, and his animated countenance, the effect was indeed conspicuous. Many of the views which Dr. Hosack entertained have since been adopted by the profession; others have been considerably modified. He had pointed out the use of the stethoscope, but he did not attribute to the beautiful study of auscultation the importance which it has since acquired; but his treatment of fever, of croup, of tetanus, of scarlatina, and many other diseases, will ever remain as enduring evidences of his skill and research. As a clinical lecturer, he brought to the bedside the same methods of quick perception, close investigation, and sound judgment; he brought every resource of his art to wrestle with the fell destroyer, and was ever ready to respond to the call of the afflicted. To the student he pointed out the marked and distinguishing features of the case, and, although pathological investigations were not then prosecuted as at present, still his great experience enabled him to point out with accuracy the character of the disease before him. His clinical lectures were clear, lucid, and practical, giving to the student such information as would serve him in the hour of need. He took a deep and abiding interest in his profession, and in all who exhibited a desire to receive information in its arduous and responsible duties. He lived in memorable times, before the great men of the Revolution had passed away; had seen and conversed with the most eminent of the age; had listened to the inspired song of Burns, tuned to sweet cadence, from his own lips; was intimate with Rush and Gregory, and Sir Joseph Banks, and was the friend of Clinton and Hamilton. “His career will ever remain to the youth of our country a bright example of the influence which industry, talent and energy have in the attainment of reputation and fame.” He is said to have possessed the confidence of the community generally, to which he was fully entitled, not only from his skill and ability as a physician, but from his urbanity of manner, social disposition, and great decision of character as well as for his uniform kindness to the poor. He never spared himself, and was never known to shrink from what he conceived to be his duty. He observed with strict precision the numerous engagements of his profession, and was always punctual in his attendance in consultation with his fellow-practitioners, treating them with deference and respect; and if he differed from them in opinion, he would patiently listen to their argument, and if not convinced, he seldom failed to persuade them to his way of thinking. So conscientious was he as a physician, that frequently upon returning home late at night, fatigued after an arduous day’s duty, feeling anxious about some patient, he voluntarily visited him, when his visit would be wholly unexpected by the family. He was remarkable for his skill in diagnosis, having a quick perception and an almost intuitive tact in detecting disease, which may, in a great measure, be attributed to the fact that he always acted upon first impressions, as the mind is then most free from bias. He was indefatigable in

his habits of industry, for he always spent hours in his study after the labors of the day, and seldom retired to rest until after midnight, either devoting himself to medical study, reading over the lecture he was to deliver the following morning, or answering letters to his numerous correspondents, professional and otherwise, which, with an extensive practice, shows a diligence and application seldom to be met with. He was not the less known as a surgeon, having been a pupil of one of the most distinguished surgical practitioners, Dr. Bayley; he was, under his tuition, fully qualified for the practice of this branch of his profession; besides having, while abroad, availed himself of the ample opportunities afforded him, while in attendance at the hospitals in London and Edinburgh, of witnessing operations performed there by Mr. Earle, Abernethy, John Bell, and others. Upon being appointed to the Chair of Surgery, he delivered, at the opening of the College of Physicians and Surgeons, in the city of New York, November, 1807, an introductory lecture, entitled, "Surgery of the Ancients." His authorities, were, of course, those of the old writers in medicine, such as Hippocrates, Celsus, Galen, and others; he was consequently obliged to translate from the original languages in which they were written, the Greek and the Latin. This lecture contains many interesting facts in surgical history. Being one of the surgeons of the Almshouse Hospital, he there performed many important surgical operations, done for the first time in America; among which may be cited that of tying the femoral artery at the upper third of the thigh, after the manner recommended by Professor Scarpa; this operation was performed by Dr. Hosack as early as 1808. He tied the same artery several times afterwards for aneurism. He introduced, as early as 1795, in American surgery, the operation for hydrocele by injection. He also contributed several valuable essays on surgical subjects and cases, such as, "Observations on Glossitis;" "Cases of Tetanus Cured by Wine, Spirits, and Brandy;" "Observations on Tic-Douloureux;" "Cases of Anthrax;" "Observations on Hemorrhage, and the Removal of Scirrhus Tumors from the Breast." In this latter communication he dwells particularly upon the advantages to be derived from exposing the wound to the air, after operations, with a view of checking hemorrhage; a practice since claimed by Sir Astley Cooper, of London. and Professor Dupuytren, of Paris. He possessed all the physical requisites for a surgeon, and had he confined himself to this department of the profession, he would, doubtless, have been pre-eminent. His attention was, however, diverted to the more elaborate theory of medicine, to the abstruse reasoning of which he directed the best energies of his mind; being encouraged so to do by the offer made him, by the trustees of the college, of the Professorships of the Theory and Practice of Medicine and Midwifery. The former of these he retained until the end of his professional career. Holding so conspicuous a situation as a leading practitioner, as well as being a professor in the university, Dr. Hosack could not fail to interest himself in most of our public scientific institutions and charities, and was instrumental in establishing several of them. His love of botanical science induced him to found

the Elgin Botanic Garden, which he did at his own individual expense, as early as 1801. It was situated about three and a half miles from the city of New York. It consisted of about twenty acres of land on the middle road. It was selected, from its varied soil, as peculiarly adapted to the cultivation of the different vegetable productions. The grounds were skillfully laid out and planted with some of the most rare and beautiful of our forest trees. An extensive and ornamental conservatory was erected for the cultivation of tropical and greenhouse plants, as well as those devoted to medical purposes, more especially those of our own country. At this time there were under cultivation nearly fifteen hundred species of American plants, besides a considerable number of rare and valuable exotics. To this collection additions were made from time to time, from various parts of Europe, as well as from the East and West Indies. It was the intention of the founder of this beautiful garden, had his means been more ample, to devote it to science generally; more especially those of zoology and mineralogy. This, however, he was compelled from want of fortune to relinquish, hoping that the State of New York would, at some future day, be induced to carry out the plan as suggested by him, similar, in all respects, to that of the Garden of Plants in Paris; but in this he was disappointed. The State purchased the garden from him, but like many other public works, unconnected with politics, it was suffered to go to ruin. While it was in his possession it afforded him many a pleasant hour of recreation, and served to abstract him from the cares and anxieties of an arduous profession. As early as 1792, by an essay published by him upon suspended animation from drowning, the corporation of the city was induced to co-operate with him in establishing an institution known as the "Humane Society." His friend, Gen. Jacob Morton, a distinguished citizen of New York, known for his charitable and benevolent acts, lent his aid in the cause, and in speaking of Dr. Hosack, says: "But in the charities of life, in those services which carry comfort to the poor and distressed, was he eminently useful. To him the 'Humane Society' is indebted for its establishment. When he first joined it, it was called the Jail Society, and its services were confined to the supply of provisions to the prisoners in jail for debt. Upon his suggestion, and through his instrumentality, a charter was obtained, extending the objects of its charity, and naming it the 'Humane Society.' A convenient soup-house was erected with the funds of the institution, aided by the corporation. Apparatus for the recovery of persons apparently drowned were procured and distributed in several parts of the city. The soup-house department of this institution was extended to the relief of the respectable poor who chose to apply." In the severe winters with which the city has been visited, this institution was eminently and extensively useful. A general direction was also given to the matron of the house never to refuse an applicant, so that the city might have the proud boast that "no one need perish from hunger." This institution existed in active operation for many years; the necessity of it has since been superseded by the liberal and more extended plan of the city almshouse establishments, and arrangements for the for-

sign poor. The City Dispensary received no less his care and attention. It was principally through his exertions that it was remodeled, and became useful both as a charity and as a school for young medical practitioners. One of the principal features of this institution was the extension of vaccination to the poor; for almost immediately after its discovery by Dr. Jenner it was, through the interests of Dr. Hosack, fully adopted, as he was among the first, if not the very first, supporters of it. In his discourse for the improvement of the medical police of the city of New York, delivered to the medical class in 1820, as introductory to a course of lectures on "The Practice of Physic," he urges the necessity of a separate and independent building for the reception of the sick poor afflicted with yellow fever or other epidemic diseases. He says: "I early in the past season called the attention of the board of health to this subject, and recommended, upon the first appearance of typhus fever in our city, the instantaneous removal of the sick either to Bellevue or some other suitable place to be provided. I then earnestly urged upon the board the necessity of some permanent provision being made commensurate with the increasing population of the city." Dr. Hosack, being at that time the resident physician, induced the corporation to select a spot at Bellevue for the erection of an extensive fever hospital, which was accordingly done. The necessity for such an institution could not be doubted for a moment; we are only surprised that New York, abounding in numerous charities, is still deficient in such accommodation for the poor, to say nothing of the advantages to be derived to the health of the city by isolating diseases of a malignant character. Additional suggestions are also made by him in this lecture deserving of notice. Of national quarantine laws he says: "It is an unavoidable inference, from the view taken of the importation of fever, that nothing short of the most rigid system of quarantine laws, and those, too, executed by officers who conscientiously believe in their utility, will secure our cities from a repetition of the evils we have experienced. Nor can our country be effectually guarded against the renewal of the yellow fever in our seaports, while our commerce continues with the torrid zone, unless the government of the United States shall, as has been done in Great Britain, institute a general system of quarantine regulations, to be strictly enforced in every commercial city of the Union. When, too, we take into view the late progress of the plague, and call to mind the introduction of that disease in former days into the cities of London, Marseilles and Moscow, have we not reason to expect that our commerce with the Levant will, ere long, add another scourge to our country, unless we are protected by a code of health laws, to be alike operative in all our seaports?" This paper on medical police contains many other valuable suggestions for the further improvement of the sanitary condition of the city, such as the extensive establishment of sewers, and the substituting for wood, stone piers, erected upon arches, thereby enabling the current to force them from accumulation, which tended so much to the engendering of disease to the citizens. It was also a suggestion that the sewers should extend to the termination of these piers, and discharge their contents into the channel. It

has often been a subject of wonder to his friends that Dr. Hosack should have found leisure, in the midst of his various pursuits, to have contributed so much to the literature of his profession. This may be accounted for by his extraordinary method and system in the division of time. His leisure moments, if such they may be called, were always occupied by miscellaneous reading, as the works of his library will attest, most of them bearing pencil-marks and reference to some facts therein contained. It was also his habit from the commencement of his professional life to record in a notebook every fact, case, or prescription deemed by him of importance. At an early period he commenced the publication of the *Medical and Philosophical Register*, in which he was associated with Dr. John W. Francis, formerly a private pupil of Dr. Hosack, and for many years afterwards united with him in his practice. This journal was issued quarterly, and each number contained a hundred pages and upwards. He afterwards published three volumes of his "Medical Essays," containing addresses before the different societies, introductory lectures, biographical sketches and obituary notices of some of the most distinguished medical men of the United States, besides some of his most practical papers on vision, scarlet fever and contagion. It was observed by a distinguished foreign critic, in reviewing his various publications, that "he would rather be the author of Dr. Hosack's paper on the Laws of Contagion, than the writer of the ponderous quarto volume of Dr. Adams on Morbid Poisons," then a popular work of the day. He also published an extensive appendix to a work on the Practice of Medicine, by Dr. Thomas, of Salisbury, England, in which are contained most of his views of the treatment of diseases generally. Adopting nosological arrangement, as a system best calculated to illustrate diseases, he was induced to prepare a work on that subject, which ran through several editions. Dr. Hosack, being the intimate friend and associate of many of the distinguished men of our country, both literary and scientific, as well as of most of our eminent statesmen, could not, with his acute penetration and singular discernment of character, have failed in forming a correct appreciation of them. His intimacy and confidential friendship with Mr. Clinton, from his earliest boyhood through life, induced him, upon the death of that distinguished statesman and accomplished scholar, to pronounce his eulogy; this he did at the request of the public authorities and different literary institutions of New York, in many of which Mr. Clinton and himself had been so intimately associated. He felt honored by the appointment, and rendered that homage to his friend which was so justly his due. It occurred at a time when Dr. Hosack was most engaged in the various duties of his profession, and it was with difficulty he could find time to complete so ample a biography as he offered to the friends and admirers of Mr. Clinton. Not being a political man himself, it required a very extensive and elaborate correspondence on the part of Dr. Hosack to obtain the necessary information from his political friends for such an undertaking. It is of interest to note the fact that the greater part of this work was written upon the backs of letters during his visits to patients while

waiting to be admitted to the sick room, so characteristic was this of his economy of time. From the flattering notices of this work by the various journals and reviews, and also by complimentary letters from distinguished men from all parts of the United States, as well as from eminent statesmen on the other side of the Atlantic, he had every reason to feel gratified with the performance of the task. His public spirit was not less manifest in his donations to the different institutions. Having imbibed, whilst abroad, a taste for mineralogy, as well as of the collateral branches of medical science generally, he early began to form a cabinet of minerals. To quote from a sketch of his life by a friend: "He attended in the winters of 1793-94, the first course of lectures on mineralogy that was delivered in London by Schmeisser, a pupil of Werner. With this additional knowledge of mineralogy which Dr. Hosack had begun to study at Edinburgh, he continued to augment the cabinet of minerals which he had commenced in Scotland. This collection was brought by him to the United States, and was, it is said, the first cabinet that crossed the Atlantic; it was afterwards deposited in Princeton College, in rooms appropriated by the trustees, but fitted up at the expense of the donor, similar to those at the *Ecole des Mines* at Paris. To render this donation immediately useful, it was accompanied by a collection of the most important works on mineralogy." He also made a liberal contribution to the library of Columbia College, consisting of several hundred volumes. The New York Hospital and historical societies profited much by his liberality. In private life Dr. Hosack was no less conspicuous for his social qualities and kindness of heart. His home was made a happy one, not only to himself, but to all who dwelt under his roof. His love of society induced him, as may be said, "to keep open house," the stranger, of any claim to literature or scientific distinction, as well as our own prominent citizens, partook of his hospitality, and always found a hearty welcome. His constant professional engagements interfering greatly with his disposition and wish to entertain, induced him to set aside an evening in each week for the reception of his friends, and he selected Saturday for that purpose during the winter months. At these pleasant "reunions" were to be found the poet, the painter, the learned theologian, and eminent jurist, as well as all who were distinguished in medical science; it was a school for the young aspirant in every department of knowledge. Of the distinguished persons who were to be seen at these "conversations" may be enumerated the Abbé Coreia, Andrew Michaux, Sir John Franklin, Dr. Richardson, Captain Sabine, Captain Basil Hall, Washington Irving, Fenimore Cooper, Bryant, Halleck, Chancellor Kent, Thomas Addis Emmet, Professor Silliman, Bishops Hobart and Wainwright, and De Witt Clinton. During Dr. Hosack's professional career, he always took pleasure in fostering talent in youth, and from his knowledge of character and acute discernment, he seldom failed in his predictions of their future success in life. Indeed there was scarcely a time when he was without some *protégé*; his selection was always among those whose want of means debarred them from obtaining the advantages of a liberal education. Those thus selected were ed-

ucated in the profession of medicine; most of them were successful, and some became eminent. In one of his early walks, when at his country seat near the city, he observed a young man gathering flowers. Upon inquiring of him his object, he discovered him to be a young Frenchman, who politely apologized in French for the intrusion, saying that he was a botanist, which proved to be a sufficient passport, and was peculiarly gratifying to Dr. Hosack, who had always been so great an admirer of that science himself. After further conversation with him, and finding him to be an ardent follower of the system of Jussieu, he became much interested, and invited him in to breakfast; this was the only introduction, but it proved to be all that was necessary. The young man informed him that his family had been obliged to leave France during the troubles of the Revolution, and he being desirous of pursuing his favorite study of botany in the wild fields of America, had emigrated to this country. The young man being poor, he adopted him into his family, and educated him in the profession of medicine, as best calculated to give him a support. In due course of time, he graduated in the College of Physicians and Surgeons in the city of New York. Upon the termination of the Reign of Terror, and the Empire being established, he returned to his native land, and became an *attaché* to the Jardin des Plantes in Paris; here he attracted the notice of some of the most eminent botanists in that country, so much so, that when the Emperor was organizing his *corps de savans* of the army of Egypt, our young friend was particularly recommended to him as best qualified for the department of botany. The Emperor gave him an interview, and asked him many questions, such as where he had studied his profession, and where he had acquired his knowledge of plants. His answers doubtless must have surprised the Emperor, who, at that time, could have had but a very imperfect knowledge of the United States. Indeed, it is creditable to our country that a young man at that early period should have been here educated in the profession of medicine, and have been prepared to occupy so important a situation, and still more surprising that he should have been chosen from among the many who, it might have been supposed, had enjoyed superior advantages. Nevertheless, such was the fact, and he proved to be not only an honor to the appointment, but to the French nation, now proud to place his name among the most learned and scientific of their countrymen; this person was Professor Delile, of the School of Medicine at Montpellier, and Superintendent of the Jardin des Plantes in that city. It was formerly, more than at present, the prevailing opinion that the study of anatomy, and medical science generally, tended to unsettle the mind, and frequently led to atheistical principles; so far from this being the fact, it has a direct tendency to awaken reflections of a very serious character, and if doubt of the great first cause exist in the minds of any one, it must be dispelled by contemplating the infinite beauty of our organization, the harmony and extraordinary combination of matter to sustain life and resist disease. In the language of a celebrated naturalist, we might exclaim, "O God! how thy works infinitely surpass the reach of our feeble understandings;

all that we actually know of Thee, or ever can, is but a faint and lifeless shadow of thy adorable perfections, in contemplation of which the highest understandings grow bewildered!" Many, therefore, who study medicine are frequently more strongly impressed with the truths of religion, and are induced to relinquish the pursuit of the former to enlist under the banner of the cross. Several who were educated as private pupils of Dr. Hosack, have since become distinguished divines, and ornaments to the church of their adoption. Though this may not be attributed to any influence which he as preceptor may have exerted upon the minds of his pupils, yet he never failed in his teaching to show his reverence for, and entire belief in, the truths of religion, and to express his high admiration of the works of the Creator. In his later years Dr. Hosack retired from the profession, with the intention of devoting himself to agriculture and rural life. It is an old saying that "professional men live well, work hard, and die poor." As a general rule, it would seem to be correct; applicable alike to law, physic, and divinity. If an exception occur, it affords the individual thus favored facilities to entertain and keep around him his old associates and friends, and to do honor to the elevated position he naturally assumes in the community generally. He lives to enjoy, in a retrospective view, his past well-spent life, honored and revered before retiring from the world. If constant occupation have prevented him from disseminating the knowledge acquired by experience, an opportunity is now afforded him of doing justice to himself by furnishing to the world the result of his labors. Dr. Hosack, after a life of nearly fifty years spent in the arduous duties of the profession of medicine, retired to his beautiful residence at Hyde Park, Dutchess county, situated on the banks of the Hudson, where he passed his remaining years, devoting himself to agriculture in all its various departments. He carried with him the same ardor and zeal which had been so characteristic of him in his professional career. He introduced into the country many of the finest breeds of cattle, sheep, and swine, which he imported at great expense from abroad. The grounds were cultivated in the best possible manner, and the most esteemed fruits and vegetable productions of the country were made to thrive in the greatest luxury possible. His extensive farm was indeed a model one, and from its wide-spread reputation attracted many strangers from different parts of the Union, as well as from abroad, to visit it. The pleasure-grounds were arranged with great taste and skill, and are thus described by some of the distinguished persons who have written travels in this country. Mr. James Stewart, of Scotland, says: "The splendid terrace over the most beautiful of all beautiful rivers, admired the more the oftener seen, renders Hyde Park, as I think, the most enviable of all the desirable situations on the river. The grounds are very charming, and the views from them very picturesque and striking, in which the Catskill Mountains form a bold and remarkable feature." Miss Harriet Martineau, in her work on this country, observes: "I felt that the possession of such a place ought to make a man devout, if any of the gifts of Providence can do so. To hold in one's hand that which melts all strangers' hearts, is to be a steward in a very serious sense of the term. Most

liberally did Dr. Hosack dispense the means of enjoyment he possessed. Hospitality is inseparably connected with his name in the minds of all who ever heard it, and it was hospitality of the heartiest and most gladsome kind. Dr. Hosack had a good library, I believe one of the best private libraries in the country; some good pictures, and botanical and mineralogical cabinets of value. Dr. Hosack drove me around his estate, which lies on both sides of the high road, the farm on one side, and the pleasure-grounds on the other. The conservatory is remarkable for America, and the flower garden all that can be made under present circumstances; but the neighboring country people have no idea of a gentleman's pleasure in his garden, and of respecting it. On occasions of weddings and other festivities, the villagers come up into the Hyde Park grounds to enjoy themselves, and persons who would not dream of any other mode of theft, pull up rare plants as they would wild flowers in the woods, and carry them away. Dr. Hosack would frequently see some flower that he had brought with much pains from Europe flourishing in some garden of the village below. As soon as he explained the nature of the case, the plant would be restored with all zeal and care; but the losses were so frequent and provoking as greatly to moderate his horticultural enthusiasm. We passed through the poultry-yard, where the congregation of fowls exceeded in number and bustle any that I have ever seen. We drove round his kitchen-garden, too, where he had taken great pains to grow every kind of vegetable which will flourish in that climate. Then crossing the road, after paying our respects to his dairy of fine cows, we drove through the orchard, and refreshed ourselves with the sweet river views on our way home. There we sat in the pavilion, and he told me much of De Witt Clinton, and showed me his own life of Clinton, a copy of which, he said, should await me on my return to New York. When that time came he was no more; but his promise was kindly borne in mind by his lady, from whose hands I received the valued legacy." Captain Hamilton, the author of the "Peninsular Campaign," and "Cyril Thornton," also makes mention of his visit to Hyde Park, and thus expresses himself: "I accepted the very kind and pressing invitation of Dr. Hosack to visit him at his country seat on the banks of the Hudson. The various works of this gentleman have rendered his name well known in Europe, and procured his admission to the most eminent philosophical institutions in England, France and Germany. For many years he enjoyed, as a physician, the first practice in New York, and has recently retired from the toilsome labors of his profession, with the warm esteem of his fellow-citizens. I reached Hyde Park in a heavy snow-storm, but the following morning was bright and beautiful. The snow, except in places where the wind had drifted it into wreaths, had entirely disappeared, and, after breakfast, I was glad to accept the invitation of my worthy host to examine his domain, which was really very beautiful and extensive. Nothing could be finer than the situation of the house. It stands upon a lofty terrace overhanging the Hudson, whose noble stream lends richness and grandeur to the whole extent of the foreground of the landscape; below, its

waters are seen to approach from a country finely variegated, but unmarked by any peculiar boldness of feature; above, it is lost among a range of rocky and woody eminences, of highly picturesque outline. In one direction alone, however, is the prospect very extensive; and in that—the northwest—the Catskill Mountains, sending their bald and rugged summits far up into the sky, form a glorious framework for the picture. Dr. Hosack was a farmer, and took great interest in the laudable but expensive amusement of improving his estate. He had imported sheep and cattle from England, of the most improved breeds, and, in this respect, promised to be a benefactor to his neighborhood. I am not much of a farmer, and found the Doctor sagacious about long horns and short legs in a degree which impressed me with a due consciousness of my ignorance. The farm buildings were extensive and well arranged, and contained some excellent horses. I visited Hyde Park again in the month of June. I now beheld its fine scenery adorned by the richest luxuriance of verdure. Poet or painter could desire nothing more beautiful. There are several villas in the neighborhood, tenanted by very agreeable families, and had it been necessary to eat *lotus* in the United States, I should certainly have selected Hyde Park as the scene of my repast." After such flattering descriptions of Dr. Hosack's home, it is not surprising that his life was now one of continued enjoyment and happiness. His habit of early rising, which, during his professional career, had been acquired from the necessity of toil and labor, now became that of unalloyed pleasure. The song of birds, the hum of bees, and the sweet perfume of flowers springing into renewed life before the rising sun, and gentle breezes of the morn, while it delighted the senses, could not fail to exert a benign influence upon a mind so well stored and fully prepared to admire "nature, for nature's sake alone." To him it was an inestimable blessing, and one which he enjoyed to its fullest extent. Referring to the last days of this noted physician, his son, Dr. Alex. E. Hosack, has written as follows: "In the autumn of 1835, Dr. Hosack removed as usual with his family to his city residence, and a few weeks after was seized with apoplexy, which terminated his existence. On Friday morning, December 18, 1835, he rose as usual in his wonted good health. After breakfast he made one or two calls in the neighborhood for the purpose of transacting business. On his return home he found he was paralyzed in his right arm. Upon entering his parlor, he calmly signified by signs, as his speech was confused, his actual condition to some members of his family. I was immediately sent for. Perceiving his situation, and in obedience to his request, I took from him eighteen ounces of blood, and directed a bed to be prepared for him in the same room. His symptoms increased, his articulation became more indistinct, and finally unconsciousness and stupor came over him; the usual treatment in such cases was pursued, but without effect. He lingered in this state until Tuesday, December 22, when he ceased to live, expiring without a struggle, and surrounded by his affectionate and devoted family. Some three or four weeks previous to his last illness, my father, in conversation with me, said to me that he had a conviction that he

would either be attacked with apoplexy or paralysis, and that the period was not far distant, and that the attack would be on the right side. So confirmed was he in this belief that he told me he intended to practice writing with his left hand, in order that he might make known his wishes in such an event. A few days after this conversation, when in his study, he handed me a note from a friend, which he said had been written with his left hand, he being paralyzed; he then made an attempt himself. The subject being a painful one to me, I discouraged further discussion of it. He continued to entertain the belief that the fatal disease was hovering over him, and acting under this impression, he stopped at the jeweller's, and ordered several rings with his hair set in them, which he presented to his children. I never could discern a reason for his adopting such a belief, as he appeared to me as well as I had ever known him. The conviction that death was so near did not disturb his tranquil mind, or affect his spirits in the least." Dr. Hosack had attained his sixty-sixth year. He received every attention during his illness from his professional friends, Dr. J. W. Francis, Dr. W. J. Macneven, Dr. Alexander H. Stevens and Dr. George Wilkes, who in his devotion and kindness seldom left his bedside. Dr. Hosack was educated a Presbyterian, his parents being members of that church. His children were also christened in that faith, but afterwards he was induced to give the preference to that of the Episcopal service, and though not a communicant, he observed its forms and ceremonies, and was a regular attendant upon church until his death. His death was noticed at the time by all the journals of the day, with appropriate and eulogistic remarks. Upon the occasion of his death the following words of tribute appeared in the *National Intelligencer*: "The death of Dr. Hosack may be considered as an additional bereavement to the city of New York, and indeed to our country, as few men have contributed more than he to elevate the character of the medical profession in the United States, and to the general encouragement of science, literature and the arts. His regular and methodical industry, and his kind though decided deportment, which immediately inspired confidence in those who had not previously tested his skill, raised him early in life to eminence and fortune; and he employed the advantages thus honorably acquired in a manner which rendered them beneficial to the whole community. Endowed by nature with a generous disposition and a taste for intellectual pleasures, his house was the seat of hospitality and refinement. There the polished European met with a society not inferior in accomplishment or elegance to any which he had left beyond the Atlantic, while the most humble individual, who had any claim to notice, from his efforts in the advancement of knowledge, or of the interests of humanity, received a welcome, and frequently found a friend. To his example and his judicious aid, many, if not all of the scientific and benevolent institutions of New York owe their origin and success. He devoted his time to them, he gave them funds, and he distributed among them precious collections of books and of objects in the various departments of natural history, in the formation of which he had spent years, and from which he could not have separated

himself without regret, in order that they might thus be rendered more accessible to the public."

HOTZ, Ferdinand Carl, of Chicago, Ill., was born in Wertheim, Baden, Germany, July 12, 1843, received a collegiate education at the Lyceum at Wertheim, and studied medicine at Jena in 1861 and 1862, at Heidelberg from 1863 to 1866, under Helmholtz, Simon and Knapp, and at Berlin in 1866 and 1867, under Graefe, Virchow and Langenbeck. He also spent a part of the year 1867 in study at Vienna. He received his diploma of M. D. from the University of Heidelberg in 1865, and after visiting Paris, London, Edinburgh, Glasgow, and Dublin, came to this country and settled in Chicago in 1869. His contributions to medical literature consist of a number of papers to the Illinois State Medical Society, and to the *Journal and Examiner*, of which he is associate editor. From 1864 to 1866 he was house surgeon in the surgical department of the University Hospital at Heidelberg, subsequently volunteer surgeon in the South German Army, during the war between Prussia and Austria, in 1866; assistant surgeon to Knapp's Eye Infirmary, Heidelberg, during 1867 and 1868, and ophthalmological surgeon to the Illinois Eye and Ear Infirmary, a position he has held since 1876. He is a member of the Chicago Medical Society; of the Illinois State Medical Society, of which he was vice-president in 1872; and of the American Medical Association. Since 1875 he has been director of the Chicago Public Library, and is at this date, 1893, Professor of Ophthalmology at the Chicago Polyclinic.

HUEBSCHMANN, Francis, of Milwaukee, Wis., was born in Riethnordhausen, Grand-duchy of Weimar, April 19, 1817, and died March 21, 1880. He was educated at Erfurt and Weimar, and was graduated in medicine at Jena, in 1841. He came to the United States in 1842, and settled in Milwaukee, where he resided until his death. He was school commissioner from 1843 till 1851, a member of the first constitutional convention, in 1846, and served on the committee on suffrage and elective franchise. He was the especial champion of the provision in the constitution of his adopted State granting foreigners equal rights with Americans. He was Presidential Elector in 1848, member of the city council, and county supervisor from 1848 till 1867, and from 1851 till 1872 served three terms as State Senator, and from 1853 till 1857 he was Superintendent of Indian Affairs of the North. During the War of the Rebellion he entered the National service in 1862 as surgeon of the Twenty-sixth Wisconsin Infantry. He was surgeon in charge of a division at the battle of Chancellorsville, and of the Ninth Army Corps at Gettysburg, where he was held by the Confederates for three days. He was also at the battle of Chattanooga, in charge of the corps hospital in Lookout Valley in 1864, and brigade surgeon in the campaign to Atlanta. He was honorably discharged in that year, and returning to Milwaukee, became connected with the United States General Hospital.

HUGHES, Charles Hamilton, of St. Louis, Mo., was born in that city in 1839. He is a son of Captain H. J. Hughes, the organizer of the first military company in the State of Iowa. The subject of this sketch is originally from Royal Welsh stock, the family being

known in English Heraldry as the Hughes of Gwercies in Edeirnion, County of Merioneth, Wales. This renowned family was granted armorial bearings, November 4, 1619, when Sir Thomas Hughes was knighted at Whitehall, Mr. Hughes then having his seat at Wells, Somerset, and at Gray's Inn, being a barrister at law. Richard Hughes, of this historical family, removed from Tipperary county, Ireland, to the New England Colonies about 1760. Referring to Burk's Encyclopedia of Heraldry, we find the Hughes, of Tipperary county were a family of great antiquity and noble alliance, and were derived from Abraham Hughes, a gentleman of Welsh descent, who crossed over to Ireland from Wales with Cromwell about 1650, and acquired by marriage a large estate in Wexford county. The great-grandfather of Dr. Hughes (Richard

C. H. Hughes

Hughes) was a Methodist and kept a public inn in Tipperary county, where he entertained John Wesley who preached from the "Upping block" in front of his house, when that celebrated evangelist made an itinerant journey from Dublin to Cork in 1750. Richard Hughes settled at first upon the site of Harrisburg, Pa., to which he subsequently obtained a title through his wife, and of which he was finally dispossessed because of non-occupancy. Upon the breaking out of the Revolution, he enlisted in the Continental Army and served throughout the whole struggle for American independence. He was with Washington at Valley Forge, and at the battle of Brandywine received a severe gunshot wound. After the close of the war he married an English lady, Elizabeth Scarlet, and located upon a farm in Rockingham county, Va. Four sons were born to them; Richard, William, John and David. Upon this farm the venerable ances-

tor of the American branch of this family, and veteran soldier of the Revolution, died at the age of one hundred and five years. Richard married Nancy Davis, a native of Virginia, and removed to West Virginia, near the present site of Weston, and subsequently to Allen county, Ohio, near Lima, in 1829. To these parents were born twelve children, seven sons and five daughters, the name of the father of Dr. Hughes being Harvey J., who married Miss Elizabeth R. Stocker, of Elizabethtown, Ind., daughter of Capt. Zachius Stocker, the founder of that town, who named it in her honor. Dr. Hughes lived in St. Louis till nine years of age, when his parents moved North, his father having become associated in many business enterprises on the upper Mississippi with George L. Davenport, son of Col. Davenport, commandant at Rock Island (who was murdered on that island), and Antonie Leclaire, an early pioneer of that upper Mississippi country. His early education was commenced in a private school for small children, located on North Fifth street, conducted by Mrs. Freeman, and continued in a public school conducted by Mr. Avery, and in the primary department of the St. Louis University. Later, after his parents had removed from St. Louis, he was sent to Dennison's Academy, at Rock Island, Ill., and completed his literary school training in Iowa College, then under the management of a faculty of professors from Amherst, Mass., a most excellent institution where instruction was so thorough that students were admitted from the classes of this college to the next higher grade in Yale or Harvard. Dr. Hughes began the study of medicine under the tutelage of Dr. John T. O'Reardon, at Davenport, Ia., who was a graduate of Apothecary's Hall, Dublin, and of the medical school at Louvain, Belgium, finishing his education as an interne in a Paris hospital under the famous surgeon Leroux. Dr. James Thistle, who went from Natchez, Miss., to Davenport, was also one of his preceptors, and while under Dr. Thistle's teaching Dr. Hughes enjoyed the friendship and medical assistance of Dr. Thistle's brother-in-law, the distinguished Dr. Cartwright, of New Orleans, who spent his summer vacation with Dr. Thistle, and inspired his pupil, young Hughes, with his own ambition and love of the profession. Dr. Hughes acknowledges a debt of gratitude to Dr. Cartwright for the interest taken in his youthful studies and the help given him by this distinguished Southern physician, now deceased. Dr. William M. McPheeters and Dr. Charles A. Pope, of St. Louis, were also Dr. Hughes' earlier instructors in medicine. Dr. Hughes' medical studies were completed for graduation at the St. Louis Medical College, where, after a four years' course of private and collegiate medical study, he graduated in 1859. During his student days he was engaged for a year as acting assistant physician in the United States Marine Hospital, of St. Louis. On graduation he visited the principal colleges and hospitals of the East, and on the out-break of the war he entered the government service as assistant surgeon, being promoted to full surgeon in July, 1862. He was then placed in charge by Medical Director Madison Mills, United States Army, of the Hickory St. Post Hospital and the McDowell's College Prison Hospital, and the Schofield Barracks, including the Strag-

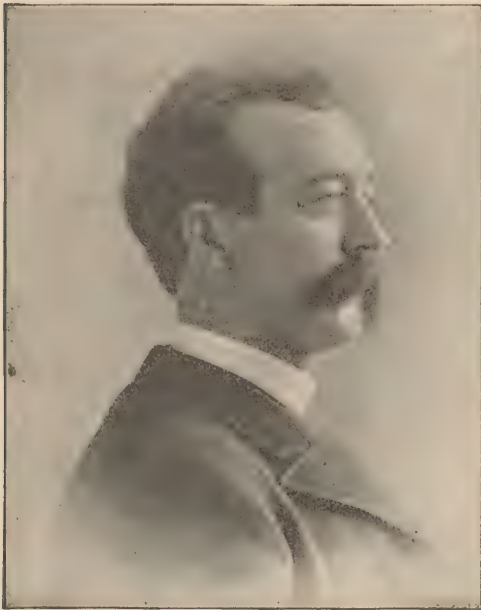

glers Camp of St. Louis. Dr. Hughes' medical services throughout the war were of the most valuable character to the government, for he had charge of the forces from St. Louis to Pilot Knob, Mo., for two years, and during the last of Price's raids into Missouri, he had also medical charge of the refugees and freedmen. He was mustered out in 1865, having earned from headquarters the praise of having the best field hospital in the service. He was one of the youngest surgeons to receive a commission in the Union Army, and on leaving the service he was placed upon the board of management, and in 1866 was elected to the medical superintendency of the Missouri State Lunatic Asylum, at Fulton, the only institution of the kind then in the State, but now called No. 1, because of two similar State asylums which have since been established, being one of the youngest superintendents in the United States at that time, as he was also one of the youngest of its full military surgeons. Dr. Hughes remained at the head of this large institution, for over five full years, making annual visits to other institutions within and without the United States, and studying with that zeal which has always characterized his professional life, the varying phases of mental and nervous diseases in hundreds of hospitals and with the kindly assistance and advice of the venerable Ray, Stribbling, Workman, Howard, Gray, and a host of other famous men among the living and the dead in the walks of clinical and forensic psychiatry who were the friends and patrons of his youth, until his young heart was filled with the grandeur of his chosen pursuit, and stimulated into a life-long enthusiasm, by the noble example of lives so illustrious and so worthy of emulation. Dr. Hughes early identified himself with the Association of Superintendents of American Institutions for the Insane, now the American Medico-psychological Association, and at the annual meetings of this distinguished body, he would come in contact with its shining lights, imbibing illumination and experience from the more venerable in years and knowledge. In 1876, at the International Medical Congress held at Philadelphia, he read before the Section of Psychiatry the first American contribution ever made before any public association on the interesting subject of the "Simulation of Insanity by the Insane." This paper was pronounced at the time and is still regarded by competent judges as the most systematic and complete treatise extant upon this important subject in forensic psychiatry. His previous essay, at Nashville, Tenn., before the Association of Superintendents, entitled "Psychical or Physical," being an inquiry into the relations of mind and organism, and a critical discussion of the mind and matter problem, which was then attracting so much attention from mental philosophers and alienists, made a marked impression upon the association and profession generally, as a remarkably clear presentation of a much discussed and most obscure subject. His contributions since this time have been numerous and almost constant, until nearly every practical subject which might engage the attention of alienists and neurologists in active practice has received elucidation in some phase from his clearly descriptive pen. Besides the many medico-legal papers, he has editorially for the past eleven years conducted

and published the *Alienist and Neurologist*, a journal of scientific, clinical and forensic psychiatry and neurology, which he founded in 1880. Its pages have contained, in each number, from its foundation to the present date, samples of his industry and genius, both in its original and editorial departments. This journal has been received, both by the practitioner and the student, with no small degree of favoritism (and circulates over the whole world), because of the peculiar perspicuity, the force, simplicity and practical character of its editorial utterances and the soundness of its doctrine generally, relating to diseases of the mind and nervous system and to questions of forensic psychiatry and neurology. In 1887 Dr. Hughes read before the Section of Psychiatry in the International Medical Congress at Washington a paper on the "True Nature and Definition of Insanity," of which body he was one of the vice-presidents of the physiological section. At the preceding International Congress at London, he presented a "Plea for Moral Insanity" in psychiatry, which there received commendation from exalted sources of psychiatric distinction. Dr. Hughes' contributions to psychiatry have been too numerous for designation here. All who are so fortunate as to know him, know that his literary standard is of the very highest, and any further mention of his writings would not raise the Doctor in the estimation of his warm admirers. We might, however, make note here that the presidential address to the Mississippi Valley Medical Association, has won for the Doctor distinction both far and near, and has awakened professional attention to many important topics; the entire paper and abstracts having from time to time been published in the principal medical journals of this country. In this address the Doctor enters considerably into the politics of this country and expressed his belief that it would be well to have a representative in the cabinet of the United States from among the physicians. He advocated the policy of physicians who are peculiarly independent or retired from active practice, entering more into the field of politics, so that their power would be felt in our legislation. He, however, strongly opposes the political interference with the administration of benevolent associations. His remarks respecting specialists have been commended by all intelligent physicians and special practitioners. He devised an aesthesiometer which bears his name. The Doctor, in 1891, made a report to the Missouri State Medical Association of the advances made in neurology during recent years, and pointed out the steps by which the present state has been reached. Among the more recent papers contributed by Dr. Hughes may be mentioned the one read before the St. Louis Medical Society, January 30, 1892, upon the "Epidemic Inflammatory Neurosis or Neurotic Influenza," maintaining that this epidemic disease is essentially nervous in its symptoms and effects on the system, although a blood poison. He calls it a "Toxic Neurosis." A medical journal thus speaks concerning Dr. Hughes: "As a physician, the Doctor is probably better known, inside and outside of America, than any physician in St. Louis. His reputation, so far as his own country is concerned, is as broad as its limits. He enjoys the esteem and confidence of a large circle of friends who contribute to making up the

extensive and lucrative practice in which he is engaged. The Doctor is a cheerful, cordial, genial and attractive man socially, and necessarily very popular, although he needs to be known to be thoroughly appreciated." In 1890 Dr. Hughes became connected with the Marion-Sims College of Medicine, and held the Chair of Professor of Psychiatry, Diseases of the Nervous System and Electro-Therapy in that institution of medicine up to the spring of 1892, when he was called to take a similar chair and the presidency of the faculty of the Barnes Medical College, in which position he still continues. Besides his membership in the American Medico-Psychological Association, he also is a member of the American Neurological Society; the American Medical Association; the Mississippi Valley Medical Association, of which he was its president in 1891; president of the Neurological Section of the Pan-American Medical Congress of 1893; vice-president of the Medico-Legal Congress for 1892; vice-president of two sections of the International Medical Congress in 1873. He is a member of the St. Louis Medical Society, Missouri State Medical Society and member of the Judicial Council of the American Medical Association. He is honorary member of the British Medico-Psychological Society; corresponding member of the New York Medico-Legal Society, and of the Chicago Academy of Medicine, and other distinguished professional bodies. Dr. Hughes has not yet written a literary novel, as many of his distinguished colleagues in medicine, like Hammond and Wier Mitchell, have done, but whenever his busy professional life has permitted him to do anything literary, the work of his pen has not been unappreciated. "The Great of Humble Birth in History," which originally appeared in the *St. Louis Magazine*; his address before the Mary Institute, on "Mind and Organism," and some of his patriotic poems, have been well appreciated; chief among them may be noted "The Patriot's Prayer," "Don't Give Up the Ship," and "Up with the Flag." One of his youthful poems, written at the age of seventeen, when financial embarrassment had overtaken his father, and he was thrown for the first time on his own resources for his further education, reflects the natural hopefulness, courage and energy of his young character, for it had for its caption "Nil Desperandum." From that time on, Dr. Hughes' career has been that of a self-made man, if there can really be said to be any who are absolutely such. At all events, after the age of seventeen, his financial resources and professional acquirements have been entirely of his own personal acquisition. One incident shows his determination to succeed in life: In 1857 he received from his father \$120—never afterwards any more—in Nebraska money, which was of par value there, but at a discount of thirty per cent. in St. Louis. This money young Hughes invested in a small cargo of potatoes at twenty cents per bushel, embarking with them for St. Louis and hypothecating the cargo as security for his passage to St. Louis. These potatoes were disposed of in that city at eighty-five cents per bushel, the proceeds invested in the same depreciated money that bought them and sent North for another load. They having been likewise disposed of, young Hughes had means enough (and more) to carry him through college dur-

ing the winter. In the following spring he went into the Marine Hospital. His character is therefore as worthy of emulation as his merited success in life is of approbation. Dr. Hughes has been twice married. His first wife was a Miss Addie Case, daughter of Luther Case, Esq., and cousin of Dr. George, of St. Louis, who was a very bright and charming lady. In 1873 he married the handsome and accomplished daughter of H. Lowther, Esq., of Calloway county, Mo. The Doctor has three children by his first wife; of his last marriage three children have also been born. We are indebted for this record of Dr. Hughes to biographies found in the *New York Medico-Legal Journal*, the *Medical Mirror*, of St. Louis, the *Northwestern Medical Reporter*, the *Lancet Clinic* and other medical journals, and to a history of the pioneers of the Ohio Valley, in which the record of the Ohio branch of his family is given.

HUGHES, Michael Aric, of Salt Lake City, Utah, was born in Lorain county, Ohio, Sep-

M. A. Hughes.

tember 23, 1850. He is of Irish extraction, his parents having come to America in the early thirties. Left an orphan when a mere child, he lived with his uncle, John Hughes, until he attained his majority. In the fall and winter of 1867-68, he attended an academy at Berlin Heights, Erie county, O., and afterwards at Oberlin College, where he remained about two years. In 1872 he began the study of medicine under Dr. E. P. Haines, of Elyria, and a few months later removed to Cleveland, where he entered upon the study of medicine at the Medical Department of Wooster University. At the same time he placed himself under the instruction of Dr. M. L. Brooks, who was at that time one of the leading physicians of the "Forest City." After three years' of study in the last-named

city, he received his degree of M. D., in 1875. In 1877 he removed to Sandusky, where, he practiced his profession for a little more than three years. In 1881, Dr. Hughes located at Port Clinton, in his native State, here he remained till the fall of 1883, when he went to New York City, and pursued post-graduate studies for eight months. In 1887 he formed a partnership with Dr. D. C. Bryant, of Omaha, Neb. In 1888, he went to Berlin, Germany, and studied there several months, after which he went to the Royal Ophthalmic Hospital, of London, studying the diseases of the eye, and at the Royal Ear Hospital, Soho Square, under Dr. Urban Pritchard. The diseases of the nose and throat he studied in Dr. Morrell Mackenzie's Hospital, in Golden Square. Returning to the United States in the summer of 1889, he located in Salt Lake City, Utah, where he successfully practices the specialty of the eye and ear. He is one of the medical and surgical staff of the Hospital of the Holy Cross, and oculist and aurist of the R. G. W. Railway Company. In September, 1891, he was married to Miss Marie Gorlinski, the accomplished daughter of Major Joseph Gorlinski, of Salt Lake City. Dr. Hughes is a member of the Salt Lake County Medical Society and Salt Lake Academy of Medicine.

HUNT, James Gillespie, of Utica, N. Y., was born in Litchfield, Herkimer county, N. Y., June 21, 1845. He is a son of the late Isaac J. Hunt, a noted physician, and is of Anglo-Saxon descent. His ancestry is traced backward through several generations to the Rev. Robert Hunt, who was one of the four brothers who emigrated from England to this country about the beginning of the seventeenth century and settled in the township of New London, Conn. The boyhood experience of the subject of this sketch was not materially different from that of a large majority of American youth, though he was fortunate in being able to devote nearly the whole of his early years to study. Beginning with the district school he continued on until he graduated at the Utica Free Academy at a comparatively early age, and he then began preparations in his father's office for the profession which was to be his life work. As all of his uncles, four in number, as well as his father were physicians, he may be said to have grown up surrounded by the atmosphere of the medical profession. After about four years of industrious study, under careful instruction, he entered the medical department of the University of Michigan, where he took two courses of lectures, and a course in the laboratory of analytical and applied chemistry. These were followed by a third course in the Jefferson Medical College, Philadelphia, Pa., from which he graduated March 13, 1871. On returning to Utica he entered immediately into practice in association with his father. This partnership continued until 1874, since which time Dr. Hunt has conducted his large practice alone, and he has met with an unusual degree of success. In attempting to note the elements of this success it may, perhaps, be justly said that they consist chiefly in this thorough knowledge of his profession, gained by persistent and judicious study, supplemented by constant reading of the later developments that have been recorded throughout the range of medical literature, coupled with a temperament and manner which happily fit him for his work. His capacity for

professional labor is almost unbounded, and he never spares his energies in his devotion to his duties. Dr. Hunt's professional standing, as well as the position he occupies in the community, may be judged to a certain extent by the various calls that have been made upon him to stations of honor and responsibility. He is a member of the Delta Phi Society, Iota Chapter, of the University of Michigan, 1869, and of the Jefferson Medical College Alumni Association, 1871; was made a member of the Oneida County Medical Society in 1872; is a member of the Utica Medical Library Association, and was its president in 1886; was elected a member of the Oneida County Microscopical Society in 1881; is a member of the American Medical Association, the New York State Medical Association, and was chosen a member of the American Public Health Association in 1880; was appointed by

James G. Hunt

Gov. A. B. Cornell as Health Commissioner of the State Board of Health, and served from 1880 to 1885; is physician to, and one of the incorporators of, the Society for the Prevention of Cruelty to Children, organized in 1881; is a life member and a trustee of the Utica Mechanics' Association; was appointed surgeon of the Board of United States Pension Examiners in 1889; was made a trustee of the Utica Female Academy in 1888, and is a director of the Globe Woolen Mills. Dr. Hunt has also taken a deep interest in fraternal organizations and is prominent as a Mason, having taken the Thirty-second Degree, and is an Odd Fellow. It is much to his professional credit that he was chosen a surgeon for the Delaware, Lackawanna and Western Railroad Company in 1885, and is acting in that capacity at the

present time; also the New York, Ontario and Western Railroad, and of the New York, West Shore and Buffalo Railroad, from 1886 to 1889. In 1891 he was elected a member of the National Association of Railway Surgeons, and in 1892 he was elected a member of the New York State Association of Railway Surgeons. He has also filled the post of Surgeon in the Faxon Hospital, 1880-86; St. Luke's Hospital, 1883 to the present time; and St. Elizabeth's Hospital, 1888 to the present date. He holds the ranks of first-lieutenant in the Forty-fourth Separate Company National Guard, and is assistant surgeon to that military organization, and was for several years president of the Utica Citizen's Corps. It is just to say that in all of these various positions Dr. Hunt has shown his fitness and capacity for his capable discharge of their duties, and earned the respect and esteem of those with whom he had been associated. In politics Dr. Hunt is a Republican, and was appointed coroner by Governor John A. Dix to fill vacancy in November, 1873, and continued in the office nearly ten years. In 1874, he was appointed health officer of the city of Utica, and still holds the office. In 1887 he was strongly urged for the mayoralty of that city and received the unanimous nomination at the convention, but for personal reasons he was compelled to decline the honor. On January 28th, 1874, Dr. Hunt was married to Ella R. Middleton, daughter of Robert Middleton, of Utica. He has contributed largely to the Annual Reports of the State Board of Health articles of great interest on public health matters. Among his best efforts in public health matters is his report as Chairman of the Committee on Public Institutions in the "First Annual Report of the State Board of Health of New York," for the year 1880. This is a very lengthy report, and the doctor presents the results attained in one of the largest and most useful public buildings—New York State Lunatic Asylum—in a very able and scientific manner, touching upon the system of ventilation, heating, drainage and water supply. In the Second Annual Report of the State Board of Health of New York, for the year 1881, as Chairman of the Committee on Public Institutions, in his introduction he says: He presents an outline of results of personal inspection and exact inquiry into the present condition and sanitary wants of school-houses, as shall fitly serve the purposes of the board to institute and induce needed sanitary improvements in our school-houses, and in the schools themselves, and at the same time to suggest and stimulate local concern in this matter. His lectures to the School of Nurses of St. Luke's Hospital, of Utica, for the past number of years, have been very instructive to the nurses, and have been read by thousands of those who have made public health a study; he is known far and near throughout the United States, on all questions pertaining to public health. As a sanitarian, he ranks among the first in the State of New York.

HUTCHINSON, James, of Philadelphia, Pa., was born in Bucks county, that State, January 29, 1752, and died September 6, 1793. He was educated at the College of Philadelphia, and graduated with the first honors of his class. He commenced the study of medicine with Dr. Cadwalader Evans, and attended the medical

lectures of the college. His tickets of admission are in the hands of his descendants and are said to be written on the back of "playing cards." In the year 1774, at the time he graduated Bachelor of Medicine, the trustees presented him with a gold medal for his superior knowledge in chemistry. Dr. Hutchinson subsequently went to London and continued his medical education under the protection and guidance of Dr. Fothergill. It is stated by his biographer, that while pursuing his studies in Europe the disputes between England and American Colonies were approaching a crisis, which he saw must end in an open rupture. The prospect of this event hastened his return to his native country, the cause of which he warmly espoused. He returned home by way of France, and was entrusted with important dispatches from Dr. Franklin, the American Minister there, to the Congress of the United States. When near the American coast, the ship in which he was a passenger, was chased by a British armed vessel, and being anxious to save the dispatches he left the vessel in an open boat under a heavy fire from the enemy and landed safely. A short time after he left the vessel, she was captured by the enemy in sight, and he lost everything he had, including a fine medical library collected in England and France. Dr. Hutchinson served in the army during the Revolution, and was especially interested in public affairs. In a vindication of himself from the charge of receiving pay to which he was not entitled, published in the *Pennsylvania Journal*, February 6, 1782, Dr. Hutchinson gave an account of the services rendered by him during the war. In this he states that he was in the employment of the United States for upwards of one year, and of the State of Pennsylvania from the latter part of 1778 till the beginning of February, 1781. While in the Continental service he had a commission as the senior surgeon to the Flying Hospital in the middle department, and with only six assistants inoculated 3,496 men, while the army lay at Valley Forge. When the army moved across the North River, after the battle of Monmouth, having no duty to perform in his own department, and desirous of being useful to his country, he went to Rhode Island as a volunteer in the expedition against that place under General Sullivan. Soon afterwards he resigned his commission. On his return to Philadelphia he was appointed Surgeon to the State Navy. The emoluments derived for medical services may be learned from the following statement: "The pay annexed to this station (State Navy) was three continental dollars and five rations per day. The duty consisted in taking care of the officers and men belonging to the galleys, and of the militia who were occasionally at Fort Mifflin. This, though considerable, was performed without an assistant." He was trustee of the University of Pennsylvania from 1779 until his death, and was Professor of *Materia Medica* in that institution from 1789 till his election in 1791 to the chair of chemistry. For several years he was secretary of the Philosophical Society. He was also for many years one of the physicians to the Pennsylvania Hospital and physician to the Port of Philadelphia. His brilliant medical career was cut short while in the prime of life. He was a victim of the epidemic of yellow fever that prevailed in the autumn of 1793.

HUTCHISON, Joseph Chrisman, of Brooklyn, N. Y., was born in Old Franklin, Howard county, Mo., February 22, 1827, and died July 17, 1887. He was of Scotch-Irish descent. Having received a collegiate education at the University of Missouri, he entered the medical department of the University of Pennsylvania, and while attending lectures at the latter institution was a private pupil of Drs. Gerhard and Peace. Graduating M. D. in 1848, he practiced during the ensuing four years in Missouri, removing thence in 1853, and establishing himself in Brooklyn, where he remained until his death. In his specialty, surgery, he successfully treated numerous notable cases, and performed the various leading operations. He was a member of the Kings County Medical Society, president in 1864; member of the New York State Medical Society, president in 1867 and 1868; member of the New York Pathological Society, president in 1871; Fellow of the New York Academy of Medicine, vice-president in 1869, 1870 and 1871; honorary member of the Connecticut State Medical Society; and corresponding member of the Boston Gynecological Society. In 1867 he was a delegate from the American Medical Association to the International Medical Congress at Paris; in 1875 a delegate from the same body to the meeting of the British Medical Association at Edinburgh; and in 1876 a delegate from the New York State Medical Society to the International Medical Congress at Philadelphia, and also to London in 1881. Among his more important publications may be mentioned: "Dislocation of Femur into Ischiatic Notch," "Treatise on Physiology and Hygiene," "Acupressure," prize essay New York State Medical Society; and reports of "Removal of Upper Maxillary and Malar Bones without External Incision," "Excision of the entire Ulna," "Ligation of External Iliac Artery for Femoral Aneurism." During the cholera epidemic of 1854 he was physician to the Brooklyn Cholera Hospital. In 1857 he became surgeon to the Brooklyn City Hospital. He was the founder and for a number of years surgeon-in-chief of the Brooklyn Orthopedic Infirmary; also consulting surgeon to the Kings county, St. Peter's and St. John's Hospitals. From 1854 to 1856 he was lecturer on diseases of women in the New York University Medical College; from 1860 to 1867 was Professor of Operative and Clinical Surgery in Long Island College Hospital, resigning his chair in the latter year; and was health commissioner from 1873 to 1875 of the city of Brooklyn. Dr. Hutchison attained in his special field of operative surgery a high rank among American surgeons. In 1880 the degree of LL. D. was conferred upon him by the University of Missouri.

HYNDMAN, James Gilmour, of Cincinnati, Ohio, was born in that city, September 12, 1853. His parents were of Scotch-Irish Presbyterian stock. His early education was obtained in the public schools of Cincinnati, and he graduated in 1870 from Woodward High School. He immediately thereafter began the study of medicine, under the preceptorship of Dr. James T. Whittaker, and was graduated from the Medical College of Ohio in March, 1874. For two years prior to receiving his degree (he was not yet of legal age) he was Resident Physician at the Cincinnati Hospital, a position always secured by competitive exam-

ination. After completing his hospital service he began practice in Cincinnati. Like all young practitioners his time was not always in great demand by patients. He occupied his spare time during his early years of practice in making abstracts and translations from the German and French medical journals for *The Clinic*, a weekly medical journal, at the time owned and conducted by the faculty of the Medical College of Ohio. His connection with this journal, either as assistant editor or managing editor, continued until it was merged into the *Lancet and Clinic*. His work on *The Clinic* was observed by Eastern editors, and as a result he was selected as one of the translators of Ziemssen's *Cyclopedia of Medicine*. The treatises on echinococcus, cysticercus cellulosæ and trichinosis, in the third volume, were all translated by Dr. Hyndman. In 1879 he was elected Lecturer, and the subsequent year was made Professor of Medical Chemistry and Clinical Laryngology in the Medical College of Ohio. While he has not altogether discontinued his general practice, his principal field of study and work has been in the direction of throat work, and the greater portion of his literary contributions have been in this department. In June, 1883, he was married to Miss Mary E. Mitchell, daughter of Samuel M. Mitchell, of Martinsville, Indiana.

E. Fletcher Ingals

INGALS, E. Fletcher, of Chicago, Ill., was born in Lee Center, Lee county, Ill., September 29, 1848. He is the second son of Charles F. and Sarah H. Ingals, who were among the early pioneers of Illinois. He is an American, proud of his ancestors, who, on his father's side, came to this country in 1627, and, on his mother's side, long before the Revolutionary War. The Doctor received his

early education in the public schools near his native place, at the State Normal Institution, and in the Rock River Seminary at Mt. Morris, Ill. He studied medicine with his uncle, Prof. Ephraim Ingals. He came to Chicago in 1867, and graduated at Rush Medical College in 1871. The same year he became connected with the spring faculty of that institution, a position which he occupied until he was elected to the regular faculty, with which he has since been identified, now holding the Chair of Diseases of the Chest and Laryngology. He has also for several years held the Chair of Diseases of the Throat and Chest in the Northwestern University Woman's Medical School, and is Professor of Laryngology and Rhinology in the Chicago Polyclinic, and is the Attending Laryngologist at the Presbyterian and St. Joseph's hospitals. He has long given special attention to this class of diseases. He is the ex-president of the American Laryngological Association, and ex-first vice-president of the American Climatological Association, and president of the Laryngological section of the Pan-American Medical Congress. He was also recently honored by the presidency of the Illinois State Medical Society. Prof. Ingals is the author of many articles on diseases of the throat, nose and chest, as also a text-book, well known and extensively used in the colleges, on the same subject, and which has already passed through its second edition. He is an indefatigable worker, giving every minute of his time to his profession, whose motto is to do the very best that can be done for each individual patient, and as a result he is one of the best known and most popular physicians in Chicago. While his professional attainments are of the highest order and place him in the front rank of the profession, he is modest and unassuming and the friend and ally of all the faithful workers in the profession with whom he comes in contact, especially among the younger physicians. He was married in 1876 to Miss Lucy S. Ingals, daughter of Ephraim and Melissa R. Ingals. They have two living children, a son and a daughter.

INGALLS, William, of Boston, Mass., son of a distinguished physician of the same name, was born in that city January 12, 1813. He was educated at North Andover and at Harvard, and studied medicine under his father and Dr. Charles Harrison Stedman and at Harvard Medical School, graduating M. D. from that institution in 1836. Soon afterward he established himself in Boston and engaged in the general practice of his profession, but early devoted special attention to obstetrics, in which field he has had vast experience and is widely known. Dr. Ingalls is a member of the Massachusetts Medical Society; of the Boston Society for Medical Observation; of the Obstetrical Society of Boston, and of the Suffolk District Medical Society. He has published a "Synopsis of Private Obstetrical Practice," 1876, which covers a period of forty-two years of his professional experience. During the War of the Rebellion he was surgeon of the Fifth Massachusetts Infantry, and of the Fifty-ninth Massachusetts Veteran Volunteers. He has also been medical director of the Second Brigade of the Massachusetts Militia. He has held the position of surgeon in charge of the United States Marine Hospital at Chelsea, Mass., and that of visiting surgeon to the Boston City Hospital.

INGE, Richard, of Greensborough, Ala., was born in Green county, that state, January 18, 1851. On the completion of his academic education he entered the Southern University, Alabama, and subsequently the University of Virginia and the University of New York, receiving the degree of M. D. from the last two institutions in 1871 and 1872 respectively. Returning to his native State he established himself in Greensborough where he has since remained engaged in a successful general practice of medicine and surgery, also filling the Chair of Anatomy in the Southern University. Dr. Inge has been secretary of the Hale County Medical Society, and first vice-president of the Alabama State Medical Association.

INGHAM, James V., of Philadelphia, Pa., was born July 5, 1843, in that city. His academic education was acquired at Williams College, after which he studied medicine and attended the medical department of the University of Pennsylvania, and received his medical degree from the latter institution in 1866 and settled in Philadelphia, where he has since remained. He early devoted special attention to obstetrics and diseases of women and children, in which line he has been quite successful. Dr. Ingham is a member of the American Gynecological Society; of the Obstetrical and Pathological Society; and is a Fellow of the College of Physicians, Philadelphia. He has edited the American supplement of the *Obstetrical Journal of Great Britain and Ireland*, and has been Obstetrician to the State Hospital for Women and Infants.

IRELAND, J. Alexander, of Louisville, Ky., of English descent, was born in Jefferson county, Ky., September 15, 1824. After receiving his English education, and acquiring a fair knowledge of Latin and Greek, he studied medicine and attended the Medical Department of the University of Louisville, and the Kentucky School of Medicine, receiving his medical degree from the latter institution, in 1851. He then established himself in Louisville, and conducted a general practice in that city and surrounding country, until 1864, when he made a specialty of obstetrics and gynecology, which he has pursued for the last thirty years. He is a member of the Kentucky State Medical Society, and several local medical organizations, and was also a member of the International Medical Congress, at Philadelphia, in 1876, and is the ex-president of the Tri-State Medical Society, of Kentucky, Indiana, and Illinois. In 1864 he was elected Professor of Obstetrics in the Kentucky School of Medicine; in 1866, Professor of Clinical Medicine in the University of Louisville; in 1872, Professor of Diseases of Women and Children in the Louisville Medical College, and in 1875 he was elected to the same chair in the Kentucky School of Medicine. He still holds this position in the Louisville Medical College and is dean of the faculty.

IRWIN, Crawford, of Hollidaysburgh, Pa., was born in Blair county, that State, April 20, 1824. He descended from Scotch-Irish ancestry, who came to this country about the middle of the last century. Having received the degree of A. B. from Jefferson College, at Cannonsburg, Pa., in 1844, he studied medicine under the preceptorship of Dr. J. A. Landis and entered the Jefferson Medical College, Philadelphia, and was graduated M. D. from that institution in 1847. After practicing for

a few months at Davidsburgh and at Johnstown, and for nearly five years at Frankstown, in his native State, he established himself in the town of his present residence in January, 1854, where he has been engaged in a successful general practice of medicine and surgery for about forty years. He is a member of the Blair County Medical Society; has filled each of the several offices of the Juniata Valley Medical Association and of the Pennsylvania State Medical Association, being elected president of the latter in 1875. He was for many years Physician to the Blair County Almshouse and to the County Prison. During the War of the Rebellion he was assistant surgeon in the provost marshal's office for one year, and was for two years examining surgeon to the United States Pension Bureau.

ISHAM, Asa B., of Cincinnati, O., was born in that State July 12, 1844. He is of New England ancestry. His academic education was received at Marietta College. In 1861 he conducted the *Lake Superior Journal* at Marquette, Mich., and in 1862 he edited the city department of the *Detroit Daily Tribune*. In the latter part of that year he enlisted as a private in the Seventh Michigan Cavalry forming part of Custer's brigade in Kilpatrick's and Torbert's cavalry divisions, armies of the Potomac and Shenandoah. In May, 1863, he was severely wounded while in action near Warrenton, Va.; was promoted first lieutenant, March, 1864; and captured in a cavalry charge at Yellow Tavern, Va., in May, 1864; was exchanged in December of the same year, and honorably discharged for disability from wounds in April, 1865. He pursued his professional studies at the Medical College of Ohio and was graduated M. D. at that institution in 1869, and established himself in Cincinnati where he has since remained, engaged in medical practice and medical teaching, holding the position of Professor of Physiology in the Cincinnati College of Medicine and Surgery, and Professor of Materia Medica and Therapeutics from 1877 to 1881. Dr. Isham is a member of the Walnut Hills Medical Society and the Ohio State Medical Society. He has contributed largely to medical literature and to the history of the late Civil War.

ISOM, Thomas D., of Oxford, Miss., was born in Maury county, Tenn., April 5, 1816. His early education was at country schools. He studied medicine at Transylvania University, Lexington, Ky., and at Jefferson Medical College, Philadelphia, and graduated M. D. from the latter institution in 1839. In 1840 he established himself at Oxford, where he has practiced his profession for more than a half century. Dr. Isom was one of the earliest practitioners in the section where he settled to leave off venesection and other depletants in the treatment of febrile diseases of malarious and malignant type with which the country thereabout was scourged, and to successfully adopt the practice of administering large doses of quinine without regard to the preparatory treatment to rid the system of irritation. He was incited to the change by the non-success of the old methods in such cases, and adopted this procedure while at the Louisville Medical School, which he attended in 1841 for the purpose of still further prosecuting his studies. Dr. Isom was a member of his State Convention in 1860, and surgeon of the Seventieth Mississippi Infantry at the be-

ginning of the War of the Rebellion, and opened the Mississippi Hospital at Warrenton, Va., in 1861; returned to Mississippi in the winter; in 1862 re-entered active service and had charge of several hospitals, and in 1863 he was placed on the Army Examining Board. In 1876 he was elected president of the La Fayette County Medical Society of Mississippi, and has been an active member of the American Medical Association.

IVES, Eli, of New Haven, Conn., was born there February 7, 1779, and died in that city, October 8, 1861. He was the son of Levi Ives, a skillful practitioner, a founder of the New Haven Medical Society, and one of the editors of *Cases of Observation*, which was reputed to be the first medical journal that was published in the United States. The subject of this sketch was graduated at Yale, in 1799, and for the next two years was rector of the Hopkins Grammar School, in New Haven. In the meantime he studied medicine, and in 1801 began practice in association with his father, meeting with great success. In 1813, in connection with the elder Silliman, he secured the establishment of the Medical Department of Yale College, and was Professor of *Materia Medica* in that institution, from 1813 till 1829, and then occupied the Chair of the Theory and Practice of Medicine and held this position for twenty-three years, resigning in 1852. He gave special attention to indigenous vegetable remedies, and is said to have been one of the first to employ chloroform, having administered it in 1831, by inhalation, for the relief of a case of difficult respiration. He founded, and was for many years president of the horticultural and pomological societies, and spent much time and labor in the maintenance of a botanical garden. He had been president of Connecticut State Medical Society and the American Medical Association; and was an active advocate of temperance, education and emancipation. He contributed valuable articles to the *Journal of Science*. His grandson, Charles L. Ives, was for several years a Professor of Theory and Practice of Medicine in Yale, and the author of an article on "Prophylaxis of Phthisis Pulmonalis," and a prize essay on the "Therapeutic Value of Mercury and its Preparations," both of which were published by the Connecticut Medical Society.

JACKSON, Abraham Reeves, of Chicago, Ill., son of Washington and Deborah (Lee) Jackson, was born in Philadelphia, June 17, 1827, and died in the former city, November 12, 1892. Graduating from the Central High School of Philadelphia, he began the study of medicine under Dr. John Wiltbank, subsequently entered the medical department of Pennsylvania College, and in 1848 received from that institution his degree of M. D. After practicing for a year in Kresgeville, Munroe county, Pa., and for eight months in Columbia, Warren county, N. J., he established himself in Stroudsburg, Pa., where he remained until 1870. In the summer of 1862 he was appointed contract surgeon United States Army, and was made assistant medical director of the Army of Virginia. An attack of typhoid fever compelled him to return home. In 1867 he was appointed surgeon to the ship "Quaker City," and in this capacity served on the trip made historic in Mark Twain's "Innocents Abroad." He was the original "My friend the Doctor" in that famous publication. Re-

moving to Chicago in the spring of 1870, he made a specialty of surgical diseases of women. Soon after entering upon practice in that city, he conceived the idea of establishing a hospital to be devoted exclusively to the treatment of diseases of this class. Enlisting the support of many prominent men and women, he worked energetically to attain the desired end, and on September 1, 1871, a charter was granted incorporating the Woman's Hospital of the State of Illinois. Of this institution, immediately upon its opening, he was appointed surgeon-in-chief. In the winter of 1872 he was appointed lecturer on Gynecology in the Rush Medical College. In 1882 he became one of the founders of the College of Physicians and Surgeons of Chicago, of which he was president up to the time of his death. He was a member of the Chicago Society of Physicians and Surgeons; member of the Chicago Medical Society; fellow of the Chicago Academy of Sciences; member of the Chicago Medico-Historical Society; member of the Illinois State Medical Society; member of the Illinois State Microscopical Society, and corresponding member of the Boston Gynecological Society. At the time of his death he was president of the American Association of Gynecologists. In May, 1874, he was elected editor of the *Chicago Medical Register*, published by the Medico-Historical Society, and with this, as also in leading professional periodicals, and in the transactions of the several societies of which he was a member, he published a number of important papers and reports. Of these may be mentioned: "Successful Removal of Both Ovaries;" "Uterine Fibroid of Posterior Wall Successfully Removed;" "Fibrous Tumor of Bladder Successfully Removed;" "Non-Ovarian Menstruation;" Vesico-Vaginal Fistula, with Cases;" "Retroversion of the Unimpregnated Womb;" "Unsuccessful Attempt to Remove Fibrous Tumor of Anterior Wall of Uterus;" "On the Treatment of Fibrous Tumors of the Uterus by Hypodermic Injection of Ergotine;" "Remarks on Intro-Uterine Polypi;" "The Ovulation Theory of Menstruation—Will it Stand?" and many other able contributions during the last twenty-five years which have served to make his professional career prominent and familiar to all readers of medical literature. Dr. Jackson was one of the most highly esteemed and best beloved members of the medical profession in Chicago. He stood with the limited few on the top rung of the ladder in his specialty, becomingly accepted the honors so freely bestowed upon him by his fellows, and in his departure they, as well as the laity, sustain the irreparable loss of a progressive leader. The immediate cause of his death was an apoplexy, which is believed to have been the sequence to a poisoning of the system by an infective wound received while performing an operation some fifteen years previously.

JACKSON, Edward, of Philadelphia, Pa., was born near West Chester, Pa., March 31, 1856. He was the son of Halliday and Emily (Hoops) Jackson, descendants of early English settlers in the Province, and was educated in the Friends' School at West Chester, and at Union College, Schenectady, N. Y., where he graduated in the course on civil engineering, in 1874. He studied medicine with Dr. Mordecai Price, of Philadelphia, and graduated from the Medical Department of the University of

Pennsylvania, in 1878. After a term as assistant in the Philadelphia Dispensary, he engaged in general practice at West Chester. In 1885, he removed to Philadelphia, and restricted his practice to diseases of the eye. In the same year he became connected with the Philadelphia Polyclinic and College for Graduates in Medicine, and in 1888 he was elected Professor of Diseases of the Eye in that institution. In 1890 he was chosen one of the attending surgeons at Will's Eye Hospital. He is a member of the American Medical Association, and in 1887 was elected Secretary of its Section on Ophthalmology. He is a member of the American Ophthalmological Society and Fellow of the Philadelphia College of Physicians. He is American editor of the *Ophthalmic Review*, and has charge of the department of Ophthalmology in the *American Journal of Medical Sciences*. He has published a small work on the "Essentials of the Refraction and Diseases of the Eye," and a large number of journal articles, among the more important of which are those on "Skiascopy, or the Shadow Test;" the "Numbering and Decenting of Prisms;" "A New Form of Ophthalmoscope;" the "Symmetrical Aberration of the Eye," and the "Extraction of Cataract."

JACKSON, George Thomas, of New York City, was born there December 19, 1852. His grandfather, Dr. Samuel Macauley, was a successful practitioner of medicine of old New York. Dr. Jackson was educated in private and public schools of New York City, and for a time in the College of the City of New York. His medical preceptors were Dr. J. W. Warner and Dr. F. Delafield. He was graduated from the College of Physicians and Surgeons, Columbia College in the class of 1878. He then entered Charity Hospital as interne, and afterwards (1879 and 1880), studied in Berlin, Vienna, and Strasburg. He began practice in New York City in 1881, and has been engaged in practice there ever since. After some three years of general practice he turned his attention to dermatology, and has been engaged in that specialty about ten years. He was appointed Visiting Dermatologist to the Randall's Island Hospitals in January, 1889, and Consulting Dermatologist to the Presbyterian Hospital in April, 1892, which positions he still holds. He has published "Diseases of the Hair and Scalp," E. B. Treat, N. Y., in 1887; and "The Ready Reference Hand-book of Diseases of the Skin," Lea Bros. & Co., Philadelphia, 1892. He has contributed various papers to medical societies and current medical literature; besides doing editorial work and contributing book reviews for the *New York Medical Journal* and *The Journal of Cutaneous and Genito-Urinary Diseases*. He is a member of the American Medical Association, the New York Dermatological Society, the New York Academy of Medicine, and other societies.

JACKSON, Samuel, of Philadelphia, Pa., was born in that city March 22, 1787, and died there April 4, 1872. He was educated in the University of Pennsylvania, and was graduated at its medical department in 1808. After conducting his father's drug store for several years and serving as a private soldier in Delaware and Maryland during the campaign of 1814, he established himself in the practice of medicine in his native city, and in 1820 became president of the Board of Health, making a special study of yellow fever. In 1821 he

aided in organizing the Philadelphia College of Pharmacy, and became Professor of Materia Medica, and held the position until 1826. In the following year he was chosen assistant to Professor Nathaniel Chapman in the University of Pennsylvania. In 1832, in anticipation of an epidemic of Asiatic cholera, Dr. Jackson was placed at the head of a commission of medical men that visited Canada, where the malady first appeared, and his reports were published in pamphlet form. During the prevalence of the disease in Philadelphia he had charge of one of the cholera hospitals in that city. In 1835 he was appointed Professor of the Institutes of Medicine in the University of Pennsylvania, and held this position for twenty-eight years, resigning his chair in 1863, and was then Emeritus Professor until his death. He acquired considerable reputation as a medical teacher, and made important contributions to the literature of his profession. As early as 1818 he read before the Academy of Sciences in Paris a paper entitled "Mediate Auscultation." He was the author of "Principles of Medicine," published in 1832; a discourse commemorative of Prof. Nathaniel Chapman, 1854, and numerous articles issued under the title of Medical Essays. He also, in 1855, wrote the introduction to J. C. Morris's "Translation of Lehmann's Chemical Physiology."

JACOBI, Abraham, of New York City, was born near Minden, Westphalia, North Germany, May 6, 1830. He was educated at the universities of Greifswald, Göttingen and Bonn, graduating in 1851. He was prosecuted for high treason and confined in Prussian State prisons from 1851 to 1853. He settled for a few months in Manchester, England, and then came to New York and established himself there in general practice, and has been actively engaged in the same for the last forty years, and has become eminent. In 1860 he was made Professor of Diseases of Children in the New York College, held the same chair in the medical department of the University of the City of New York from 1865 till 1870, and in 1870 became Clinical Professor of the Diseases of Children in the College of Physicians and Surgeons. He has been president of the New York Pathological and Obstetrical Societies, and twice of the Medical Society of the County of New York. He has been visiting physician to the German Hospital since 1857; to Mount Sinai Hospital since 1860; to the Hebrew Orphan Asylum since 1868; and to Bellevue Hospital since 1874. He is also consulting physician to the New York Skin and Cancer Hospital. In 1882 he was president of the New York State Medical Society and in 1885 became president of the New York Academy of Medicine. From 1863 till 1871 he was joint editor of the *American Journal of Obstetrics and Diseases of Women and Children*. In 1873 he married Mary C. Putnam, the noted physician, medical author and teacher, of New York, who was the first woman admitted to the Ecole de Médecine, Paris, where she was graduated in 1871. His contributions to medical literature are voluminous and very valuable. Among them may be mentioned the following: "Inaugural Thesis," written in Bonn in 1851; "De Vita Rerum Naturalium;" "Invagination of the Colon Descendens in an Infant;" "On the Oxy sulphuret of Antimony as an Expectorant;" "On

the Etiological and Prognostic Importance of the Premature Closure of the Fontanels and Sutures of the Infantile Cranium," 1858; "On Diphtheria," 1860; "Dentition and its Derangements;" "Clinic on Diseases of Children in the New York Medical College," 1862; "Contributions to the Pathology and Therapeutics of Croup," 1868; "Some Unknown Causes of Constipation;" "On Congenital Sarcoma;" "On the Development of the Infant Brain," 1869; "Contributions to the Pathology and Therapeutics of Diphtheria," 1875; and of a "Treatise on Diphtheria," in 1880. He contributed chapters on the care and nutrition of children, diphtheria and dysentery, to Gerhardt's "Handbuch der Kinderkrankheiten" (Tübingen 1877) also articles on some of the important affections of Childhood in Pepper's "System of Practical Medicine," and has published lectures and reports on midwifery and female and infantile diseases, and articles in medical journals. His "Sarcoma of the Kidney in the Fetus and Infant," is printed in the transactions of the International Medical Congress at Copenhagen.

JAMES, Thomas Chalkley, of Philadelphia, Pa., was born in that city in 1766, and died there July 25, 1835. "He was of Welsh ancestry, and of that band of earnest, honest, Christian men, followers of George Fox, who embraced the offers of perfect toleration made by William Penn, and making large purchases of land in the province of Pennsylvania, migrated with their families to the yet unexplored wilderness to establish there amid the privations incident to the New World homes in which their posterity might hold in peace principles which in the Old World they were denied, privileges which they valued only less than their sense of duty to God. Agriculturists in the Old World, they retained their fondness for the same pursuits in the New; and a belt of outlying townships, to which they lovingly gave the familiar names of the different parts of the principality from which they severally came, still surround Philadelphia, and transmit to succeeding generations the evidence of the source from whence their fathers sprang." From this stock arose the James, Cadwalader, Lloyd, and other families, associated in each generation with the best society in Philadelphia, and furnishing to each the medical men, who discharged with fidelity the trust reposed in them. Dr. Caspar Morris, the friend and colleague of the subject of this sketch, has written that Abel James, the father of Dr. James, settled in Philadelphia, and became an active and successful merchant, one of the number of those whose privilege it was to give to the mercantile character of the city a position which certainly has never been excelled. Enterprising in their undertakings, zealous in their efforts, honest in their principles, high-minded and honorable in their transactions, they earned for themselves a name, which was adorned by a modest and simple deportment, and a liberal and generous style of living, appropriate to the ample fortunes which were the fruit of their industry. The substantial city residences, and spacious country mansions now swallowed up by the ever-increasing growth of the city, were not the only tokens of their taste. The choicest editions of the best authors of the period were imported freely, with the more bulky cargoes of the ships which

crowded the wharves, and found among them a ready sale. Mr. James had collected what, at that time, would have been thought a handsome private library, even in the mother country; thus proving the possession on his part of an elevated and refined taste, which he transmitted to his children, together with the appliances for its cultivation. Holding the first rank among the merchants of Philadelphia, he cheerfully united with his fellow-citizens in the patriotic determination to sacrifice their present interests by resisting the encroachments on their liberties as Englishmen, made by the government of the day; and met the attempt at "taxation without representation" by the agreement to abstain from the importation of the products of the industry of England. When the struggle for independence took place, of resistance to oppression, Mr. James withdrew from the city to an estate in the vicinity belonging to his wife; where, according to contemporaneous testimony, "he found employment for half the village of Frankford in rebuilding the family-seat, where he kept open house and a plentiful table, at which the traveler was hospitably entertained, while the wandering beggar freely partook with the servants." One of the popular legends of the Revolutionary War relates, that at the juncture when the fortunes of our country were at the lowest ebb, the Federal treasury exhausted, and Washington, with a handful of men whose term of service had expired, was conducting his masterly retreat through New Jersey before the forces of Lord Howe, he appealed to Congress for a certain sum of hard money, which was absolutely essential to the existence of the army. Robert Morris, who was at the head of the committee on finance, meeting Mr. James in the street, was asked by him, "What news?" to which he replied, "The news is that I am in immediate want of a sum of hard money, and that you are the man who must procure it for me; your security to be my note of hand and my honor." Though a "Friend" and non-combatant, Mr. James at once did what scarcely any other could have done, advanced the money and relieved the embarrassment of the country. The friend of Benjamin Franklin and a member of the American Philosophical Society, he was among the earliest and most prominent promoters of the many efforts for the improvement of the province which had their origin at that early period. He was a member of the Provincial Assembly, and as such was appointed on a committee to examine the possibility of a project to establish a commercial connection with the northwestern country by the medium of a canal to unite the waters of the western lakes with those of the Delaware and Schuylkill; while the construction of bridges, lighthouses, and other means of promoting the facilities of access to the city, in which he took an active interest, proved his enlarged and liberal views. Such was the paternal ancestry of Dr. James. His mother was a daughter of Thomas Chalkley, widely known as an eminent member and minister of the Society of Friends. Through both father and mother he inherited an honorable name, and from them he received an education and training in conformity with the principles which governed their own actions. He received a good classical education at the "Friends' School," where he was the pupil of

Robert Proud, the historian. It was the purpose of his parents to provide him with the most ample facilities for the cultivation of his powers, and he chose the medical profession as that which presented both a strong incentive to intellectual culture, and the widest field for the application of philanthropic energy. Having completed his scholastic course he commenced his medical studies under the direction of Dr. Adam Kuhn, himself a pupil and friend of Linnæus, and then Professor of the Practice of Medicine in the University of Pennsylvania. It had been the intention of his father, and his own hope, that he should prosecute his studies still further in the schools of Europe; but the proverbial vicissitudes of commerce, falling ever with most force upon the most enterprising in the pursuit of business, prostrated the fortunes of his father; while his mother, with a high feeling of honor, willing to sacrifice everything to preserve the reputation of her husband for integrity, threw her own patrimony, which was handsome, into the fund for the liquidation of his indebtedness. Young James thus found himself at the very outset of his career called to imitate the virtues, and illustrate the principles which had been instilled into his childhood. The dissipation of his cherished hope only stimulated him to increased exertion. Instead of abandoning his plan for enlarging the stores of preparation, he took his degree of Bachelor of Medicine from the University in the year 1787, when he was only twenty-one years of age; and accepting the position of surgeon on board of an East Indiaman (of which the father of Prof. Alfred Stille was supercargo) bound to Canton, China, with which port the merchants of Philadelphia at that period carried on a large and lucrative trade, he, by a judicious mercantile adventure, secured the means for the accomplishment of his cherished wish—to prosecute still further his medical studies; while he at the same time was promoting the same result by the opportunity thus afforded for observation of foreign climes and manners, as well as by the experience of the year's practice of his profession. With the means thus acquired, he repaired to London about the year 1791, where he found his fellow-townsmen, Dr. Physick, pursuing his studies as a pupil of John Hunter, at St. George's Hospital. Dr. James entered himself as a pupil in a lying-in hospital, under the care of Dr. Osborne and Dr. John Clark; and spent the winter of 1791-92 in London, in the study of his profession, while he also availed himself of the opportunities for elevating social intercourse which his parentage and connection presented. The following winter was spent in attendance upon the courses of the University of Edinburgh, though he did not remain to take a degree. Returning home, he reached Philadelphia during the summer of 1793, in time to participate in the anxieties, responsibilities, and perils of the fearful pestilence which, in the autumn of that year, devastated the city. A handsome piece of plate, presented to him by the Welsh Society of Philadelphia, as a token of their appreciation of his faithful services to their countrymen during that terrible epidemic, remains in his family to perpetuate the remembrance of his moral courage and professional skill. Dr. James was not prevented by his religious scruples from

taking part in the patriotic movements of the day, or from serving the cause of his country in upholding its government and laws. When the young men of Philadelphia were called upon by General Washington, in 1794, to lend their aid in the suppression of the rebellion which first threatened the stability of the newly-formed Republic, Dr. James proffered his services, and joined the army, which marched from Philadelphia to suppress the disturbance in the western counties of Pennsylvania, which is known as the "Whiskey Insurrection." He joined the expedition in the capacity of Surgeon of "McPherson's Blues," a *corps d'élite* of young gentlemen, who had promptly tendered their services at the request of their President. The expedition was a bloodless one, from the force employed, which overawed the insurgents; but it tried the spirits and endurance of these delicately educated youths, and sometimes subjected them to depression. "To dispel this in a measure, fell to the lot of Dr. James, who, upon a drum-head, wrote an inspiring song, which was set to music and sounded through the camp with renovating accents." We thus find him fairly launched on his voyage of life. There are few things more important to the young aspirant after professional distinction than the knowledge of his adaptation to the one or the other of the several paths which lie open before him. The physician, the surgeon, and the obstetrician are equally members of the noble brotherhood of medicine. But for entire success in either line, special qualities of mind are requisite. We have seen that Dr. James, when in London, availed himself of the best opportunities presented there for the acquisition of practical knowledge of the obstetric art. Midwifery had been taught in Philadelphia, it is true for many years, by Dr. Shippen, and more than one of the older physicians was specially devoted to that branch of the practice. The feelings and habits of the community had not yet, however, been brought into accordance with just views of its pre-eminent importance. The lives of mothers and infants, and the happiness of husbands and families, were too frequently sacrificed at the shrine of a spurious modesty, which demanded that the hour of the greatest human anguish, and that in which is concentrated the sum of human hope, should be confined to the care and control of ignorance, too often combined with meddlesome and pretentious charlatanism, utterly without qualification to avert evil or afford relief. Dr. Dunlap, who was then the principal obstetric practitioner, though especially devoted to that branch of practice, was too frequently called upon only when nature had failed, and ignorance had done her worst. He was, moreover, getting old. No man could have been found with higher qualifications to step into the breach, and place the flag of the profession triumphantly on the high ground it has ever since sustained in this community than Dr. James. Perfect in his bodily proportions, possessing features of the purest style of manly beauty, from which radiated not only the expression of a highly gifted intellect, but the manifestations also of a kindly, generous, noble heart, he ever arrested the attention of the passing stranger as a citizen worthy of honor; while those who knew him most intimately prized

him most highly, and found each added year of acquaintance, and every opportunity for more close and searching investigation of his character, to give additional assurance that he was one whose ingenuous nature had survived its contact with the world, and whose guileless truthfulness justified the confidence which was reposed in him by the entire community in which he dwelt. Bland and courteous in his manners, refined in his feelings, and delicate in his address, he carried with him a presence which invited the confidence of the female heart, and disarmed the repugnance to receive from the other sex the assistance which may be needed in the hour of maternal anguish, which innate modesty must always feel. His patient disposition was itself supported by the intellectual stores which he had accumulated, and which he could also render available to beguile the tedious hours of labor; while the tones of cheerful encouragement were mingled with expressions of sympathy, which at once soothed the fears and excited the hopes of the sufferer and her friends. At the foundation of these qualifications were others still more important. He was calm and dignified, and had that self-possession which can legitimately spring only from the consciousness of having devoted himself thoroughly to the study of his art, and of having, with untiring assiduity, rendered himself master of all the stores of knowledge which had been accumulated by the observation and thought of his predecessors. The extreme modesty of Dr. James led him ever to esteem more highly than he should have done, the merits of others when contrasted with his own; but when thrown on his own responsibility, and left to the acting of his own mind, his powers were always equal to any emergency. Thus qualified for the post, he became the founder of the school of midwifery in this country. Dr. W. Shippen, Jr., had, it is true, annually delivered a few lectures on the subject, in connection with his course on anatomy; and, so early as 1797, Dr. W. P. Dewees had made an unsuccessful attempt to deliver a private course of lectures on the same branch. It was not, however, till after nearly ten years' practice that Dr. James, in conjunction with Dr. Church, delivered a complete course of lectures on the science of midwifery. In order to accomplish this object, he procured the establishment of a lying-in department in the Hospital of the City Almshouse, accepting the onerous duty of attendance upon it, and admitted the students who attended his lectures, in sub-classes of three, to be present at each accouchement. With respect to these lectures, we are told that, "To render his teaching useful, Dr. James, assisted by Dr. Church, not only employed the usual modes of illustration, but zealously endeavored to instruct practically as well as theoretically." So assiduous was Dr. James in the prosecution of this undertaking, that he had no sooner closed the first course, on March 2, 1803, than he entered upon a second, beginning on the 10th of the same month. During three years, he continued to deliver two courses annually. On the death of his first associate, Dr. Church, he formed a fresh alliance with one who was destined to an eminence as lofty in another branch as Dr. James had acquired in obstetrics; and who even then afforded unmistakable evidence of the ability and eloquence which placed him subsequently as professor of practice

in the front rank of American teachers. Dr. Nathaniel Chapman was, during several years, the able and accomplished associate of Dr. James, in the delivery of his course of lectures, and contributed largely to promote the establishment of the just claims of midwifery to stand on the same level with the other branches of the medical profession, an achievement for which we are chiefly indebted to Dr. James. On the death of Dr. Shippen, who held the Chair of Midwifery, in connection with that of Anatomy, Dr. Wistar, who had during many years been Adjunct Professor, was elected by the trustees of the University to fill the vacancy. Recognizing the importance of midwifery, and the necessity that it should receive more attention from the students than it would while it held a secondary rank, and was kept in an unnatural alliance with anatomy, Dr. Wistar communicated to the trustees of the university his views on the subject, and urged upon them the necessity of the erection of midwifery into a separate chair. It was not, however, till after the lapse of two more years (1811), with courses necessarily imperfect, that the board acted upon this suggestion, and created a distinct professorship of midwifery. To this Dr. James, who had received the honorary degree of M. D. from the university, was appointed, with Dr. Chapman as assistant professor. Even then, however, so gradual is the advance of light, the attendance upon these lectures was left to the choice of the students, who were attracted by the diligent and faithful teaching of James and the brilliant eloquence of Chapman, though they were not obliged to submit to the examination of their knowledge on this subject in order to qualify themselves for the degree of Doctor of Medicine. Finally, in the year 1813, on the death of Dr. Benjamin Rush, who had held the Chair of Practice, Dr. Barton, Professor of Materia Medica, was advanced to the vacant chair, while Dr. Chapman was elected to that of Materia Medica, and Midwifery was placed on the same footing as the other chairs, with Dr. James as the sole incumbent. He was at this time in the maturity of his physical and intellectual power. His personal appearance was highly attractive, his knowledge of his subject as great as that of any contemporary, and it was his privilege to sustain fully the honor of the post assigned to him. His lectures were the product of careful study and diligent preparation. They contained an accurate analysis of all the knowledge which had been accumulated by the labors of Smellie, and Denman, and Burns, and Baudelocque, combined with the results of his own observation and large experience. His manner of delivery was appropriate to the subject and the character of the man. There was a quiet, unostentatious simplicity which attracted the attention of the student and commanded his respect. Having thus secured, by long-continued, patient and judicious effort, a proper appreciation of the value of obstetric science, Dr. James continued, during more than ten years, annually to interest, as well as to instruct, the large and steadily increasing classes which frequented the halls of the University of Pennsylvania. But about the year 1825, the result of uninterrupted mental and bodily exertion, pursued by night and by day with little intermission, began to be manifest. There was first a mere tremor of the muscles of the

right arm. This soon extended to the body generally, and finally so impaired his utterance that it was with difficulty he could fill with his voice the amphitheater in which he lectured. Unwilling that the large classes of students which then frequented the University course should suffer any injury from his failing strength, Dr. James made application to the trustees to appoint an assistant, and Dr. W. P. Dewees, who had become possessed of a wide reputation as a lecturer on midwifery in the Medical Institute established under the auspices of Dr. Chapman, was appointed by them to that post. Upon him Dr. James gradually devolved the duties and honors of the chair, dividing with him the emoluments, until, in the year 1834, he resigned the professorship, from a conviction that his failing powers were inadequate to the toils and duties which were inseparable from it. The private practice of Dr. James had long been large and select, and it could not be but that his patients were warmly and devotedly attached to him. The same motives which induced him to resign his public duties, impelled him now also to curtail his practice. He had been, first as physician and then as obstetrician, one of the medical staff of the Pennsylvania Hospital during twenty-five years. He well merited the encomium of the board, who, in accepting his resignation, tendered him "their acknowledgment for his long, faithful and useful labors, and assured him of their cordial regard and best wishes." Dr. James was deeply interested in everything which had a tendency to promote the advancement of medical science, and after having served the Philadelphia College of Physicians in various official relations, he was elected president of that body on the death of Dr. Parke, an office which he held till his death. To that body he made occasionally verbal and written communications on subjects which were always interesting and instructive. He was also associated with Drs. Hewson, Parrish and Otto, as editor of the *Eclectic Repertory*, which, during eleven years, disseminated among the medical men of this country important abstracts from foreign journals and books, then not accessible as now, while original papers on practical subjects were also added to the stores thus culled from other sources. The modest estimate of his powers, which was a strongly marked peculiarity of Dr. James, caused him to shrink from a large responsibility as a medical writer, and induced him to adopt as a text-book of his course of lectures the work of Dr. Burns, to the American editions of which he added many valuable notes, the expression of his own views as distinguished from those of the author. Almost every young man of refined taste and cultivated intellect has, at some period of his career, ventured either more or less into the field of literature. It was so with Dr. James and a select circle of his youthful associates. Minor poems and fugitive essays were published by him anonymously in the periodicals of the day. They served to beguile the hours of youth, and to confer on him the reputation of a man of literary acquirements. The same tastes and dispositions were marked features in his character through life. He was always fond of reading, and sought his relaxation in the companionship of books rather than in the social circle, from which he was too much inclined

to withdraw himself. He thus maintained his familiarity with the Greek and Latin classics, was a good German and French scholar, and entered with the zest of congenial taste into the frequent perusal of the works of the best English writers of his own day as well as of the past. Botany was a favorite subject of study, to which he invited others by his precept and example. In the history of our own country he took especial interest, and it was through his influence, and almost entirely by his fostering care, that the Pennsylvania Historical Society was organized, with the design of gathering the scattered fragments of local history before they should be irrecoverably lost. In his private personal relations Dr. James was signally blessed. At an early period he was united in marriage to a lady in every way adapted to make happy that home to which he ever retired as the center of his delights and the focus of his affections. She was permitted to minister to his happiness and comfort during a period more prolonged than is generally allotted to this hallowed relation, and survived his death. The false assertion that medical men are prone to infidelity has been so often reiterated that it has passed into almost axiomatic acceptance. There is no foundation for the calumny. The loftiest men in our profession have been as prominent for their piety as they have been distinguished by their intelligence, ability, and professional attainments. An array of names might be presented, if this were the proper place to do so, carrying uninterruptedly, through each successive generation, the stream of those who have thus honored their nature by rendering honor to their God. It is no violation of propriety to record the fact that Dr. James was, in the strictest sense of the word, and in an eminent degree, a Christian man. Having been made sensible, by personal experience, of the necessities of his nature, he investigated carefully the relations of man to his Creator, and accepted, with the full assurance of intelligent faith, the offers of the Gospel as the only ground on which man can rest his acceptance with God. Not satisfied with this, he scrutinized with diligence the various diversities which mark the profession of this faith, and recognizing the common foundation of them all, in active relief in the merits of a divine Savior and the atonement of the Son of God, he clung to this as his own hope through life; and most truly did he adorn the doctrine, by his effort to imitate the character of Christ. It would be impossible to catalogue and arrange his virtues for display, or to analyze them for investigation. They may be summed up in the language of inspiration. He had "his fruit unto holiness." His philanthropy was extensive, embracing in its affections all the various human interests which claim the sympathy of man. Yet was it limited in its application by that discretion which is necessary to give practical value to what, without it, becomes a mere fruitless sentiment; or, what is worse, an erratic misapplication of power. He bestowed his pecuniary means with an unsparing hand. We may not raise the veil which he himself gathered in careful folds over the ceaseless daily operations of his charity, which, as a living principle, was ever renewed in its inexhaustible supply, and diffused daily its gentle and refreshing streams, causing joy and gladness to follow in his path.

There was no relation—as husband, father, friend, citizen, or man—which he did not adorn by the active virtues appropriate to each. Such was he in life; and when that life drew to a close, it was with the mellowed light and rich drapery of the departing day, perfect in its beauty, awful in its majesty, sublime in its truthful simplicity. After years of feeble health, borne with the patience of a Christian man, and some weeks of active disease, the sure precursor of dissolution, he called to his bedside those medical friends who had ministered, as best they could, to his necessities, and with calm composure addressed to them his sincere thanks for what he was pleased to call their skillful and assiduous care; and then, recognizing the steady and near approach of the end of the relation which thus subsisted between them and himself, expressed his desire that they should sustain him in the hour of dissolution, adding, “It is a fearful thing, a very fearful thing, to change this state of existence, but my trust is not in works of righteousness that I have done, but in the mercy of God in the face of Jesus Christ.” Thus, with characteristic abnegation of all personal merit, and with firm faith in his Redeemer, he passed from this world.

Henry Jameson.

JAMESON, Henry, of Indianapolis, Ind., was born in Marion county, that State, September 9, 1848. He is of English descent, and is a son of the late Alexander Jameson, a man noted for his integrity and business capacity, who served the people as county commissioner for a number of terms, and was one of the board which built the splendid court-house of Marion county, one of the most attractive architectural features of Indianapolis. The subject of this sketch was educated at Butler, then known as the Northwestern Christian University, from which he graduated in 1869. He then studied medicine, and attended Bellevue Hospital Medical College, New York, where he received his medical degree in March,

1871, and having passed a successful competitive examination, served as one of the physicians of the hospital for one year. In 1872 Dr. Jameson returned to Indianapolis and entered into practice with his uncle, Dr. P. H. Jameson, and Dr. David Funkhouser, both leading physicians. This arrangement lasted for about ten years, when the uncle and nephew formed their present partnership. Immediately on beginning practice, young Dr. Jameson was elected Demonstrator of Chemistry in the old Indiana Medical College. In 1876, when the College of Physicians and Surgeons was organized, he was elected to fill the Chair of Chemistry, and held this position two years, when he was elected Professor of Materia Medica and Therapeutics in the same institution, and on its consolidation with the reorganized Medical College of Indiana, he was assigned to the Chair of Chemistry once more. Dr. Jameson in succession filled chairs in Obstetrics and Diseases of Children and Practice of Medicine, and has, since 1889, held the Chair of Clinical Medicine. He is popular both with his students and his colleagues in the profession, and is widely recognized as a successful teacher in his department. In the earlier years of Dr. Jameson's practice he was an enthusiastic student of chemistry and microscopy. His knowledge of these studies, and especially the former, caused him to be much sought after over his State in matters involving medical jurisprudence, in the way of making analysis in criminal cases and as an expert witness. He has perhaps been called on to testify in a larger number of important cases in his State than any other physician or scientist of his age. Among the large number of these was the Lewis Lumpkin case, in which Ex-President Harrison was employed in the defense, and in which his client was acquitted, and others which attracted much interest in legal and other circles. Before a large and constant practice, added to his duties of professor, so closely monopolized Dr. Jameson's time and energies, he had become noted for his researches with the microscope, and was of service in making a more extended use of the same in medical and general science. While teaching in the Medical College of Indiana, he devised an original apparatus for illustrating in the class-room, in a practical manner, the phenomenon of the total reflection of light. This apparatus was of sufficient merit to attract general attention, and was adopted by the Stevens' Institute of Technology for the purpose of illustrating this principle to the classes. Dr. Jameson was also the first to introduce in medical teaching the method of projecting by the electric lantern objects for illustration before the class. He was one of the organizers of the American Society of Microscopists, in which Indianapolis may justly claim the greater share of credit for its initial success. Of this, Dr. Jameson was secretary for a term and a leading spirit for years. He is a member of the consulting staff of the St. Vincent and City Hospitals and City Dispensary, and a member of the Marion County and Indiana State Medical Societies, of the American Medical Association and also of numerous social organizations. His widely known skill and success as a physician, his genial disposition, untiring industry and capacity to perform a large amount of continuous labor through sleepless nights, without loss

of good nature or ability to cheer and encourage his patients by his presence, are traits of character which have added largely to his professional and social popularity.

JAMESON, Patrick Henry, of Indianapolis, Ind., was born in Jefferson county, that State, April 18, 1824. He is of Scotch-Irish descent. Having received for the times a good education, he came to Indianapolis in September, 1843, where he taught school for several years, during which time he began the study of medicine with the late Dr John H. Sanders. He graduated from the Jefferson Medical College of Philadelphia, March, 1849, and immediately after located in Indianapolis, where he has since busily and continuously practiced. None of his *confrères* have prescribed oftener, or visited more patients than he; and none have remained so many years active in the profession. In the early years of his practice he encountered both Asiatic cholera and an epidemic of dysentery, which prevailed generally and was very fatal. At this time he was first

P. H. Jameson

to observe a malignant and fatal form of anaemia, which affected women in the latter months of gestation. He is a charter member of the Indiana Medical Society, founded in 1849; also of the Indianapolis local society of which he was president in 1876. He has also been connected with several other like organizations. Of his published writings are: "The Commissioner's Annual Reports for the Indiana Hospital for the Insane," from 1861 to 1879 inclusive; and also several similar reports for the Institute for the Deaf and Dumb, and the Institute for the Blind; all of which were published by the State. He also presented a paper to the Indiana Medical Society on "Veratrum Viride in Typhoid and Puerperal Fevers," which was published in the proceedings of 1859, and almost entirely republished in the *American Journal of the Medical Sciences* of that date. He is also the

author of an address on "Scientific Medicine in its Relations with Quackery," published in the *Indiana Medical Journal*, 1871. From 1861 to 1868, he was a commissioner or trustee of the Indiana Hospital for the Insane. From April, 1861, to March, 1866, he was surgeon in charge of the unorganized United States troops in quarters for the Military Post of Indianapolis. From January 1, 1863, to March, 1866, acting assistant surgeon United States Army in the same service. From 1861 to 1869 he was physician for the Indiana Institute for the Deaf and Dumb. From 1869 to 1879, was president of the several boards of the benevolent institutions of Indiana. The holding of this office made him a member of the three boards, which respectively managed the Hospital for the Insane, the Institute for the Deaf and Dumb, and that for the Blind. To this responsible and important office he was twice re-elected by the State legislature for the term of four years. From 1863 to 1869 he was a member of the common council of Indianapolis. As such he took an active part in all its affairs. As chairman of the committee on revision of ordinances in 1865 he made a complete revision of the city laws which was then published in book form. From 1865 to 1869 he was chairman of the finance committee of the council. Under his guidance and by the aid of his associates such levies and expenditures were made as restored the depreciated credit of the city and cleared it of a heavy debt by the close of his term. As the chairman of a special committee for that purpose, he devised an original plan for the establishment and conduct of the City Hospital. This was embodied in an ordinance drafted and reported by him, which was passed by the council May 2, 1866. This plan was a new departure, in that it authorized a resident medical superintendent, something then not in vogue, but which seems to have worked well, as it has ever since been continued. In 1872-73 the legislature by a law then enacted made him *ex-officio*, a member of a provisional board to erect a hospital for the insane women, in connection with the Hospital for the Insane near Indianapolis. He was by the terms of this act associated with the late Governor Thomas A. Hendricks and certain other State officers for the purpose indicated. To provide the means for this work, an appropriation of six hundred thousand dollars was made by the State. He was chosen treasurer of this board and had custody of its funds. Under its direction the buildings of the magnificent institution now known as the Indiana Central Hospital for the Insane was completed. No State officer ever labored so long as he, or more earnestly or effectively for the good of the unfortunate insane of Indiana. He has for thirty years or more been a director of Butler University; was the sole agent for the sale of its large real estate property in Indianapolis, and for the erection of its buildings at Irvington. While president of its board he effected a union between it and the Indiana Medical College which continued several years. As one may easily infer from the foregoing, Dr. Jameson is a man of affairs, well versed as to business methods. He has long enjoyed a well earned competency. In philosophy he is an optimist. He thinks things are pretty good already, and slowly, but certainly growing better. He accepts

the cardinal truths of the Bible; loves a good man or a good deed, but dislikes bigotry and cant, and above all that limited class of noisy religionists who "say and do not" and other like shams. While the Doctor is not a specialist, he is quite well versed in all branches of medicine. The specialist was not available in his earlier years, and like the physicians of that time, he was compelled to treat all kinds of ailments. More later, however, he has preferred the general practice and has gladly consigned to specialists such of his cases as belong to them; but he still thinks the highest medical skill consists in the ability to treat a dangerous case of acute disease so as to give the patient the best chances of a perfect and speedy recovery. As a practitioner he is rather conservative, preferring established methods and agencies to those of doubtful utility. It has been his aim to be progressive without being empirical. His deportment in the sick room is quiet, kindly, cheerful and reassuring, but never gushing. He is deservedly popular, both in his profession and out of it. In society his manners are affable and unostentatious, but at times somewhat diffident and constrained. The accompanying plate is from a photograph taken in 1893. He is quite active and well preserved for one of his age. He has been most happy in his domestic relations. On June 20, 1850, he was married to Maria Butler, a daughter of the late Ovid Butler, a prominent lawyer, and the founder of Butler University. This union remains unbroken. He has two living daughters, Mrs. John M. Judah, of Memphis, and Mrs. Orville Peckham of Chicago, and one son, Ovid Butler Jameson, a well known attorney of Indianapolis. His character and standing as a physician are high, and he is regarded as a useful and enterprising citizen.

JANEWAY, Edward G., of New York City, was born August 31, 1841, in Middlesex county, N. J. He was educated at Rutgers College, New Jersey, from which he graduated in 1860, after which he served as acting medical cadet United States Army, during 1862 and 1863, at one of the military hospitals in Newark, N. J., and pursued his professional studies at the New York College of Physicians and Surgeons, graduating in 1864. He then settled in New York City, where he has become eminent in the practice of his profession. He is a member of the New York County Medical Society, of which he was censor in 1873; of the New York Pathological Society, of which he was vice-president in 1874; of the New York Medical Journal Association, of which he was president in 1876; of the New York Public Health Association, and of the American Public Health Association. In 1875 he was appointed health commissioner for the city of New York, and held this position until 1882. He was Professor of Pathological Anatomy in the University Medical College, New York, in 1869. From 1868 to 1871 he was Visiting Physician to the Charity Hospital, New York, and from 1870 to 1874 to the Hospital for Epileptics and Paralytics, as he has been to the Bellevue Hospital since 1871, and also one of the Pathologists to that institution from 1867 to the present time. He likewise delivered a course of lectures on *materia medica* and therapeutics at the Bellevue Hospital Medical College from 1873 to 1876. He then became Professor of Pathological Anatomy and His-

tology, Diseases of the Nervous System and Clinical Medicine. In 1881 he added the instruction in principles and practice of medicine to his duties. As a diagnostician his reputation is second to no other physician in this country, and his consulting practice is quite extensive. His principal contributions to medical literature consist of articles in the medical journals of New York; of an article (of which he is joint author) in the *Bellevue Hospital Transactions*, concerning the autopsies made in that institution; of an article on "*Leucocythæmia*," in the *New York Medical Record*, 1876, and of a clinical lecture on "Points in the Diagnosis of Hepatic Affections."

JARVIS, George C., of Hartford, Conn., was born of New England parentage, April 24, 1834. He received his general education at the public schools and Military Academy, Norwich, Vt., and at Trinity College, Hartford. After reading medicine under his father, Dr. G. O. Jarvis, he attended the University of the City of New York, at which institution he was graduated M. D. in 1860. He first established himself at Stamford, Conn., where he remained until the commencement of the War of the Rebellion. He then entered the National army and served as surgeon in field and hospitals throughout the war, being in Virginia from December, 1861, till October, 1862; in the Department of the South, in charge of post and general hospitals at Fernandina and St. Augustine, Fla., and in the siege at Morris Island, till April, 1864; in the Grant campaign about Richmond and at Petersburg, Va., to December, 1864, where he served as operating surgeon for flying hospitals of the tenth, eighteenth and twenty-fourth army corps; at Fort Fisher, as chief of operating staff, and was subsequently in charge of exchanged Union prisoners at Northeast Station, near Wilmington, N. C., and was in charge of the general hospital at that place. In 1866 he married Martha, daughter of George Gillum, Esq., of Portland, Conn. Dr. Jarvis has served as State Examiner at the medical department of Yale College for many years; as Visiting Surgeon at the Hartford Hospital, and as president of the United States Examining Board for Pensions, at Hartford.

JEFFRIES, B. Joy, of Boston, Mass., and of New England parentage, was born in that city, March 26, 1833. He was educated at the Boston Latin School, and graduated at Harvard University, in 1854. He also studied medicine in the Medical Department of the same institution, and from which he was graduated M. D. in 1857. His medical education and training was supplemented by two years' study in the leading schools and hospitals of Europe, after which he established himself in his native city, and devoted especial attention to diseases of the eye and diseases of the skin. Dr. Jeffries is a member of the Massachusetts Medical Society, and of the American Ophthalmological Society; also of the Boston Society of Medical Observation, and of the Boston Society of Natural History. Among his more important contributions to medical literature may be mentioned: "*The Eye in Health and Disease*," 1871; "*Animal and Vegetable Parasites of the Human Hair and Skin*," 1872; "*Boylston Prize Essays on Diseases of the Skin*," "*Enucleation of the Eye-ball*," and "*Cases of Cataract Operations*." He has held

the position of Ophthalmic Surgeon to the Massachusetts Charitable Eye and Ear Infirmary, and the same position to the Carney Hospital and to the New England Hospital for Women and Children.

JENKS, Edward W., of Detroit, Mich., was born in Victor, N. Y., March 31, 1833. His father, Nathan Jenks, of New England, of Quaker ancestry, emigrated to Indiana in 1843, where he founded a town called "Ontario," and endowed a collegiate institute called "La Grange Collegiate Institute." Young Jenks received his academic education there, and attended lectures in the medical department of the New York University in 1852, and at the Castleton Medical College, Vermont, in 1855, at which time he received his medical degree from the latter institution. He also, in 1864, received the *ad eundem* degree of M. D. from Bellevue Hospital Medical College, New York, and settled in Detroit, Mich., where he has since remained. Dr. Jenks had, prior to this, practiced his profession in Ontario, Ind., and Warsaw, N. Y. He was one of the founders of the Detroit Medical College, in 1868, and became president of the faculty and Professor of Obstetrics and Diseases of Women. From 1871 till 1875 he was Professor of Surgical Diseases of Women in Bowdoin College, Me. He has also been Surgeon to the Gynecological Department of St. Mary's Hospital and St. Luke's Hospital, and Consulting Surgeon to the Woman's Hospital of Detroit. He is a member of numerous medical societies, the American Medical Association, and was president of the Detroit Academy of Medicine in 1870, and of the Michigan State Medical Society in 1874. He was formerly editor of the *Detroit Review of Medicine*. In recognition of his eminent medical attainments, the degree of LL. D. was conferred upon him by Albion College, in 1878. He was appointed to the Chair of Medical and Surgical Diseases of Women in the Chicago Medical College, and moved to that city in 1879, but on account of climatic difficulties, returned with his family to Detroit in 1884. He is now Professor of Gynecology in the Michigan College of Medicine and Surgery. He is the author of numerous contributions to professional literature, including "Report of a Successful Case of Cesarean Section," 1877; "Practice of Gynecology in Ancient Times," 1882, and "New Mode of Operating for Fistula in Ano," 1883. He is one of the authors of "American System of Practical Medicine," edited by Dr. Wm. Pepper, 1885, and of the "American System of Gynecology," 1887. Dr. Jenks is regarded as one of the leading gynecologists of Detroit, having devoted special attention to that field of practice during the last thirty years.

JENNINGS, Roscoe G., of Little Rock, Ark., was born in Leads, Me., June 11, 1833. His English ancestry, settled in this country near the close of the seventeenth century. His early education was received under the instruction of Gen. O. O. Howard, at the Wayne High School, and he was also a student at Monmouth Academy and Kent's Hill Seminary, in his native State. In 1853, he entered the office of Alonzo Garcelon, M. D., at Lewiston, with whom he pursued his professional studies until he graduated. He attended Dartmouth College and the Medical School of Maine, receiving his medical degree from the

latter institution, in 1856. Soon after which he settled in Lapeer, Mich., where he practiced his profession about a year, when he removed to Arkansas. During the War of the Rebellion he was surgeon of the Twelfth Arkansas Infantry, and was division surgeon of Gen. J. R. Jackson, of the United States Army. In 1864 he was contract surgeon United States Army, at St. John's Hospital, Officer's Hospital, Small-pox Hospital, and the Refugee and Freedmen's Hospital. In 1865, he was appointed United States examining surgeon for pensions, and was Surgeon-General of Arkansas, during the State revolution, in 1874. He was alderman of the city of Little Rock, and a director of the Merchants' National Bank for several years, and its vice-president in 1870. He has been engaged in the general practice of medicine and surgery in the city of his present residence since 1864. He is a member of numerous medical societies, including the State Medical Society of Arkansas and the American Medical Association, and has been secretary of the former organization. He is Secretary of the Medical Department of the Arkansas Industrial University, and Professor of Clinical Surgery and Dermatology in that institution. He is the author of various papers contributed to medical journals, and of works relating to the sanitary condition and vital statistics of his adopted city and State.

JOHNSON, Hosmer Allen, of Chicago, Ill., was born in a town called Wales, near Buffalo, N. Y., October 22, 1822, and died at his home in the winter of 1891. He lived in his native village until about ten years of age, enjoying those advantages for early boy life which spring from a home filled with elevating influences, and from contact with the phenomena of rural nature. "It was interesting to note how this early study of the beautiful in nature acted like a lofty education, and impressed itself on the whole tone of his mind. Near his early home there is a hill range of considerable height. Its rocks are carved by streams into gorges, decorated with mosses and wild flowers and crowned with woods. Here the boy, Hosmer Johnson, used to wander and climb, studying the beauty of the views, and filling his memory with pictures which tinted all his after life and were never effaced by the larger views of other regions. Here he learned to love nature, and to realize how its magnificence typifies the glory of its Creator. These sentiments never died out. On the contrary, they strengthened with his growth, and helped to form in him that pure and elevated taste which gave such a charm to his whole career. It was this which caused him to select a scientific profession, as well as to study nature for a recreation. He traversed wild rivers in a canoe, sleeping in the forests; he climbed the White Mountains on foot, and rolling himself in a blanket, slept under the stars with a friend or two at his side. The same feeling led him to explore Switzerland, California, Colorado and the mountains about Puget's Sound." These memories prompted him when he assisted to found the Chicago Academy of Sciences and the Astronomical Society, as well as the Historical Society, and led him to say and do all he could to encourage the study of natural objects. Such results are worthy of thought at a period when the growth of cities is more and more shutting men out of nature. Perhaps if we could bring more chil-

dren under the influences which molded the youth of Johnson, we would have more such men in after life. "At the age of about ten years he removed to Almont, Mich., and helped cut a farm out of the woods, at a time when wolves and Indians were far more abundant than civilized beings. During this period an attack of sickness left him with an irritation of the bronchial tubes which never fully left him, and caused many of his acquaintances to suppose for fifty years that he was on the verge of consumption. There was, however, not the slightest tendency to tuberculosis in any part of his body, but the pulmonary irritation subjected him to repeated attacks of pneumonia, and it was one of these which at last caused his death at the age of sixty-eight years. In his early manhood he expected only a short life, and scarcely dreamed of attaining the age which he finally reached." In the year 1841 he entered an academy at Romeo, Mich., where he prepared for college, and then entered the University of Michigan, from which he graduated in 1849. His educational career showed a remarkable talent for the acquisition of languages, both ancient and modern, and he studied Latin, Greek, Hebrew, French, German, Italian, and, to some extent, Spanish. In his boyhood he also picked up, from the surrounding Indians, a considerable practical knowledge of the Ojibway tongue. Three years after taking his degree of A. B. he received the degree of A. M., and at a later period that of LL. D. After graduation he went to Chicago and commenced the study of medicine under the supervision of Prof. Herrick. In 1851 he became the first interne of Mercy Hospital, and in 1852 graduated in Rush Medical College. In 1853 he became a member of the faculty, and continued with it until 1858, when he resigned. Not long after his resignation he united with a few others in founding the Chicago Medical College, in which he was a professor and trustee from the beginning to the day of his death, and was the first president of the faculty. He was for some years editor of the *Northwestern Medical Journal*, and afterwards a member of the City, State and National Boards of Health. During the War of the Rebellion he was commissioned by the Governor, with the rank of major, as one of the board for examining surgeons and assistant surgeons for the Illinois regiments, and such was the faithfulness of the board that the medical officers of Illinois were conspicuous in the whole army for their thorough knowledge and their humane and skillful conduct on the field of battle. It is said that as member and president of this board, he examined for appointment over one thousand physicians. In examining assistant surgeons for promotion, he had to traverse the field of war, and his duties brought him occasionally under fire, at which times he showed his skill as an operator and as a manager of field ambulance service. After the great Chicago fire, Dr. Johnson was one of the chief managers of the Relief and Aid Society, which distributed millions of dollars of property among the sufferers. Dr. Johnson was much more than simply an eminent physician. He was a magnificent man, possessing a clear, trenchant intellect, and a great and noble heart. His reputation is without spot and his honor without stain.

He married Miss Margaret Seward, a relative of the New York statesman, William H.

Seward. He had two children, of whom only one survived him, Dr. Frank S. Johnson, Professor of Pathology in Chicago Medical College.

Not all the good of earth die young:
Of him no truthful tongue spoke ill;
And praises to his gentle skill
By twice ten thousand hearts are sung.

JOHNSON, Joseph Taber, of Washington, D. C., was born in Lowell, Mass., June 30, 1845. He is a son of Rev. Lorenzo Dow Johnson, he is a descendent of John Alden, who came to this country in the May Flower, and is also descended from Revolutionary ancestors, and is a member of the Society of the Sons of the American Revolution. His attendance at Columbian University was interrupted by the war in 1861, but he was awarded the honorary degree of A. M., in 1869. He received the degree of M. D. from the Medical Department of Georgetown University, in 1865, and from the Bellevue Hospital Medical Col-

Jos. Taber Johnson

lege in 1867. He held the position of acting-assistant surgeon United States Army, and was assigned to the Freedmen's Hospital after the close of the war, and for three years was Professor of Obstetrics and Diseases of Women and Children in the Howard University, in Washington. In 1870, he visited Europe, and spent much time in the Hospitals of Dublin, Edinburgh, London, Paris, Berlin, and Vienna. He passed his examination before Professor Carl Braun, in Vienna, and received a diploma for proficiency in obstetric operations, in 1871, since which date he has practiced his profession in Washington, making a specialty of obstetrics and gynecology. He has been connected with many of the city hospitals and dispensaries; was surgeon to the Columbia Hospital for Women, which he reorganized in 1891, and from which he resigned in 1892. He is at present Gynecologist to the Providence

Hospital; Consulting Gynecologist to the Emergency Hospital and Central Dispensary; President of the Woman's Dispensary; in charge of his own private Hospital for Gynecological and Abdominal Surgery; and Professor of Gynecology in Medical Department of the University of Georgetown, in which he has lectured since 1874. He is a Fellow of the American Gynecological Society, of which he was one of the founders, and was its secretary and editor of its Transactions for three years; Fellow of the Southern Surgical and Gynecological Society; Fellow of the British Gynecological Society; of the Massachusetts Medical Society; of the Virginia Medical Society; American Medical Association; Medical Society and Medical Association of the District of Columbia; Washington Obstetrical and Gynecological Society, of which he was president for two years; he was also president of the Medical Society of the District of Columbia, and Alumni Societies of his two *Alma Maters*; member of the Philosophical and Anthropological Society of the District of Columbia, and received the Degree of Doctor of Philosophy from Georgetown University, in 1890. He is author of many papers, addresses, and reports of important cases, mostly on subjects relating to his specialty. Dr. Johnson has opened the abdomen over 300 times. In May, 1873, he married Edith Maud, daughter of Professor William F. Bascom, of Washington, D. C., and they have a family of five children.

JOHNSTON, William W., of Washington, D. C., was born in that city December 28, 1843. Having studied medicine under the preceptorship of his father, the late Dr. Wm. P. Johnston, he attended the University of Pennsylvania, from which institution he received his medical degree in 1865. He was for twelve months resident physician in Bellevue Hospital, New York, and was for six months in the Charity Hospital and other institutions on Blackwell's Island. He then went to Edinburgh, Scotland, and became clinical assistant to Prof. I. Hughes Bennett, and also assistant to Dr. T. Grainger Stewart, Pathologist to the Royal Infirmary. Afterward he pursued his professional studies in Paris, and in 1868 returned to Washington and established himself in practice. He is a member of the Royal Medical Society of Edinburgh; of the Medical Society of the District of Columbia, was secretary of the latter in 1870, and is a member of the Philosophical Society of Washington; American Medical Association; American Association of Physicians, and American Climatological Association. Dr. Johnston has been the Professor of the Theory and Practice of Medicine in the Medical Department of the Columbian University since 1871, and has been Consulting Physician to the Children's, Garfield, and Emergency Hospitals for many years.

JONES, John, was born in Jamaica, N. Y., in 1729, and died in Philadelphia, Pa., June 23, 1791. He was a son of Dr. Edward Jones, one of the earliest colonial physicians, and a grandson of Dr. Thomas Wynne. Both of these ancestors were Welsh physicians, who came over with William Penn in 1682, and were men of the best education that their day could offer. Both were active practitioners of physic, and lived to hold many offices of political trust and honor in their adopted country. Dr. John Jones went abroad early

and again at a later date, and was educated professionally at the medical schools and hospitals of London, Paris, Leyden and Edinburgh, where he became acquainted with the most eminent contemporary professors. In England he was a warm friend of Hunter and Potts. On his return after a long sojourn in Europe, he settled in New York. In 1755 he served with Sir Wm. Johnson in the French war. He was Professor of Surgery in King's College from 1767 till 1776, and was one of the two original founders of the New York Hospital, Dr. Samuel Bard being the other (1771). For a time he sat in the senate of New York. He left New York on the British occupation of the city and entered the army, and in 1778 he settled in Philadelphia after that city had been evacuated by the enemy and there spent the remainder of his life. He succeeded Dr. Redmon in the Pennsylvania Hospital, and became the first president of the Humane Society, and was physician of the Philadelphia Dispensary until his death. He was regarded as one of the ablest surgeons of his time, and especially skillful as an operator in cases of lithotomy. It is said that he was so expert that he frequently operated for stone in a minute and a half. For this malady (vesical calculi) he attended Franklin of whose philosophical cheerfulness in his last illness he has left a detailed and interesting account. Dr. Franklin remembered him in his will as among his personal friends. In 1790, the year he attended Franklin, he went to New York to consult in the case of Washington, who suffered at that time from some acute disease of the lungs. Both in New York and Philadelphia he was highly esteemed, holding several offices of trust and importance connected with his profession, and was honored by the confidence and friendship of the leading men of our country. We are indebted to Dr. Jones for the first American book on surgery, entitled: "Plain Remarks upon Wounds and Fractures," New York, 1775. This work was dedicated to Dr. Thomas Cadwalader in which he said: "If I can not cure the fatal diseases of my unfortunate country, I can at least pour a little balm into her bleeding wounds."

JONES, John C., of Gonzales, Texas, was born in Laurence county, Ala., March 10, 1837. His parents, Tignal and Susan (King) Jones, were born in North Carolina, and descended from ancestry who came in early days from Scotland and Wales. They emigrated to North Alabama, and were among the pioneer settlers of that wealthy and refined community that peopled the Tennessee Valley in ante-bellum times. He received his academic education at LaGrange College, Alabama, a noted institution of learning in those days, where he had the advantage of such instructors as Hardy, Wadsworth and Rivers, celebrated educators of the South. Having taken the degree of A. M. he came to Texas in 1856, and joined his parents, who had previously located in San Antonio. After a few months preparation in reading, he went to Scotland and entered the University of Edinburgh. He remained there four years, taking the degree of M. D. The university was then in the zenith of its fame, and numbered among its officers, Sir William Gladstone and Lord Brougham; in surgery, Sir James Syme, of whom it was said: "He never spoke an unnecessary word,

nor spilt an unnecessary drop of blood." Sir James Simpson, to whom the world is indebted for the invaluable boon in the discovery of chloroform, conferred upon Dr. Jones a special diploma in obstetrics. He also took a special course in surgical pathology and operative surgery, under Sir Joseph Lister. Graduating at Edinburgh, he went to Dublin, and was appointed resident student in the Rotunda Hospital, one of the most extensive and renowned maternity institutions in Europe. While there he attended the clinics of Stokes and Corrigan, also the eye clinics of the talented Sir William Wilde, father of the esthetic Oscar Wilde. From Dublin he went to London, and took the surgical courses of Ferguson, Erichson and Paget, attending the eye clinics of Bowman and Chritchett, at Moorefield Eye Hospital. Leaving London, he went to Paris and continued his studies in the hospitals under Velpeau, Nelaton, Jobert, Trousseau and Chassaignac. During his studentship in Edinburgh he spent his vacations in visiting all the places of historical interest in Great Britain and on the Continent, embracing a tour through the Alps on foot. When the first notes of war between the States were sounded across the Atlantic in 1861, he returned at once to his native land, and on the personal recommendation of the late President Jefferson Davis, was assigned to duty in the army of Northern Virginia, and served as surgeon in the famous Hood's brigade until the surrender at Appomattox. He attended the brigade in all its numerous battles and skirmishes, without a day's absence, endearing himself to his comrades. As the result of those gigantic conflicts in Virginia, Maryland and Pennsylvania, he had a rich field in which to put into practice the sound surgical knowledge that he had imbibed from his masters in Europe, and soon became known as one of the most skillful operators in the army of Northern Virginia. He was selected to take charge of General Hood, when that gallant commander was desperately wounded at Chickamauga, and had him carried by faithful litter-bearers a distance of sixteen miles, to a farm house, where he remained with him until he was restored. At the close of the war, Dr. Jones made his way back to Texas upon the steed that had borne him through all his campaigns, and located in Gonzales, where he has since continuously resided and practiced medicine. He has served on all the examining boards of his judicial district; is county physician and health officer of Gonzales; is a member of the Texas State Medical Association, and has been elected one of its vice-presidents and chairman of the section on surgery, and is also a member of the American Medical Association, and of the Ninth International Medical Congress. He was one of the first physicians and surgeons in the State to successfully open the abdomen for the relief of intestinal obstructions, and for the treatment of wounds of the intestines. It has also fallen to his lot to be called upon to perform the important operation of lithotomy upon his own father, a feat that no other surgeon, the writer knows of, has performed. Some of the most successful and honored members of the medical profession in southwestern Texas have read medicine in his office; among the number may be mentioned the late Drs. G. W. Kerr, of Waelder; J. J. Atkinson, of Yorktown; Patton, of Sweet

Home; Roger Atkinson, of San Marcos; Brown King, of Rancho; W. A. King, of Lavernia, and Lee Roy Beach, of Houston. Dr. Jones was married in 1867 to Miss Mary Kennon Crisp, daughter of Dr. John H. Crisp, a wealthy planter of Colorado county, Tex., and formerly an eminent practitioner of West Tennessee and North Mississippi, who emigrated to South America at the close of the war, and died in Brazil July 8, 1888, in his ninetieth year. Dr. Crisp witnessed the abolition of slavery both in the United States and Brazil. Dr. Jones' family consists of his accomplished wife, two daughters and three sons. He has prospered, amassed a handsome fortune, and resides in an elegant home. Constantly occupied by the demands of an extensive practice he has found little time to write; nevertheless, he has contributed liberally to Texas surgery, and has written some valuable papers that have been published. He is of medium size, five feet eleven inches in height, weighs one hundred and sixty pounds, has brown hair and dark hazel eyes, is retiring and studious in disposition, and like most of the descendants of the old families of the South, is fond of fine horses and field sports. He is a devout churchman, and has long been a warden of the Church of the Messiah, Gonzales.

Joseph Jones

JONES, Joseph, of New Orleans, La., was born in Liberty county, Ga., September 6, 1833. In the subject of the present sketch we recognize a man of mark in the medical and scientific world, whose achievements in the realm of authorship, and as an original investigator, command the respect and esteem of co-workers in the several departments claiming his industry and abilities; a profound scholar, skilled

professor, and notable chemist; an indefatigable laborer in the vineyard of his profession, and a practitioner who has devoted over thirty-five years of his life to the alleviation of human suffering. His father, was the Rev. Charles Colcock Jones, D. D., a distinguished Presbyterian divine, eloquent in the pulpit, eminent as a theological instructor, and the author of a "History of the Church of God;" his maternal grandfather, was Capt. Joseph Jones, of the Liberty Independent Troop, who served in the War of 1812; his great-grandfather on the paternal side, was Maj. John Jones, an officer in the Continental Army, who was aide-de-camp to Brigadier-General Lachlan McIntosh, fell before the British lines around Savannah during the memorable assault in October, 1779, and himself connected with the Pinckneys, Haines, Swintons and Legarés of the Palmetto State, his ancestor in the male line having removed from England to Charleston, S. C., nearly two centuries ago. Dr. Joseph Jones reflects in his person and accomplishments the dignity of an old and honored family. Concerning the life, history and professional achievements of this noted physician, Mr. Charles E. Jones, of Augusta, Ga., has kindly contributed the following interesting details: His early education was, in the main, acquired through the aid of private tutors at the paternal homes, Montevideo and Maybank plantations, in Liberty county, Ga. In 1849, when he was sixteen years of age, he repaired to South Carolina College, at Columbia. Having completed his Freshman studies in this institution, he matriculated at Nassau Hall, Princeton, N. J., in the Sophomore class, 1850. There three profitable years were spent, and, graduating with distinction, he received his A. B. diploma from that college in June, 1853. Selecting the healing art as his profession, Dr. Jones subsequently entered the medical department of the University of Pennsylvania, where he addressed himself with all diligence to a preparation of his life-work. His record while a student was commendable, and his progress rapid. Shortly after the award of his doctorate, which occurred in 1855, in recognition of the high order of his attainments, he was elevated to the professorship of Chemistry in the Medical College of Savannah, Ga. This appointment dates from 1856; and since then he has, under various auspices, filled the position of medical instructor continuously up to the present time. In 1858, he became Professor of Chemistry and Geology in the State University, at Athens, and in the following year was called to the chair of Chemistry in the Medical College of Georgia, in Augusta. This office he retained during the period covered by the late war, faithfully and energetically performing the duties incident to it, except when interrupted by active engagements in the field. In 1866, he was tendered the professorship of Institutes of medicine in the University of Nashville. Responding to the call, he repaired to that city, and at once became identified with the interests of that institution. His connection with that university was only terminated when he removed to New Orleans, in the fall of 1868. It was there that his distinguished labors in behalf of the Medical Department of the University of Louisiana, now Tulane University, began. He is still actively associated with the position of Professor of Chemistry, in which he was then in-

stalled. Dr. Jones' appointment as visiting physician to the Charity Hospital of New Orleans, was likewise contemporaneous with his arrival in that metropolis. His long and valuable ministrations in this capacity have proved beneficial, alike to the State of Louisiana and to the cause of medical science. Numerous have been the honorable and influential positions which the subject of this sketch has at different periods occupied. He was the chemist of the Cotton Planters' Convention, in 1860, and the compiler and author of the first report submitted to that body touching the agricultural resources of the "Empire State of the South." When the Southern Historical Society was founded, in New Orleans, in May, 1869, he became the first secretary of that organization. The framer of its original constitution, and an intense friend of the movement which gave it birth, Professor Jones was energetic in the consummation of its purposes. For two years or more he continued a zealous participant in the labors of this society. To his individual efforts the sustentation of its vitality in the infant stage of its history, was to a large extent due. The organization was, subsequently (about 1873), transferred to Richmond, Va., its present place of abode. The officers of the Southern Historical Society, as first founded in New Orleans, were, Rev. Dr. B. M. Palmer, President; General Braxton Bragg, Vice-President; and Dr. Jones as Secretary and Treasurer. In April, 1880, Professor Jones was made president of the Board of Health of the State of Louisiana, which had been reorganized in accordance with the provisions of the State Constitution of the preceding year. His appointment was by the Governor, and his term expired in April, 1884. Truly, the four years constituting his tenure of this responsible position were replete with important results! His administration of the affairs of the board were characterized by ability, fidelity and enlightened industry. His conduct merited the approbation of the public, and should challenge the emulation of succeeding presidents. In April, 1887, Dr. Jones was elected president of the Louisiana State Medical Society, and for the space of a year fulfilled the duties belonging to that office. His annual address before the Society in the spring of 1888 is embodied in the second part of the third volume of his "Medical and Surgical Memoirs." He bore a prominent part in the deliberations of the Ninth International Medical Congress, which convened in Washington City in the summer of 1887. On that interesting occasion he acted as president of the Fifteenth Section—Public and International Hygiene. In 1890 he was made Surgeon-General of the United Confederate Veterans. Alluding to his war experiences, we record the fact that Doctor Jones was commissioned full surgeon in the Confederate Army in 1862. His duties as such ceased in 1865. For some months prior to receipt of his commission, he had regularly discharged the functions of the office to which he was afterwards promoted. As early as January, 1861, he volunteered in the Liberty Independent Troop, and entered upon active service in October of the same year. During his connection with this cavalry troop he acted as surgeon to several hundred organizations doing duty on the Georgia coast. Prof. Jones is a member of leading medical and scientific

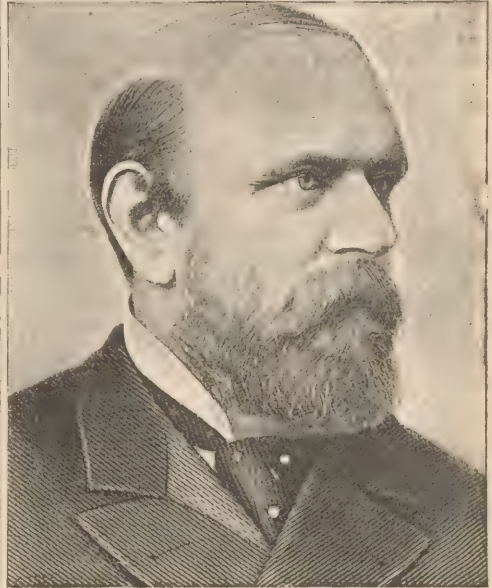

societies, both in this country and in Europe. His chief claims to distinguished recognition rest upon his achievements in the field of original investigation, and upon his reputation as an authoritative and exhaustive writer. From this latter stand-point we will now consider him. Permitting several minor publications, his first production was "Investigations, Chemical and Physiological, Relative to Certain American Vertebrata." It was comprised in the eighth volume of the Smithsonian "Contributions to Knowledge," and appearing in 1856. The inquiries forming the subject-matter of this monograph, which met with a cordial reception, were commenced while the Doctor was still a lad, and in the summer of 1853. In the same year (1856) his "Physical, Chemical and Physiological Investigations upon the Vital Phenomena and Offices of Solids and Fluids of Animals" (an inaugural dissertation for the degree of M. D.) was given to the public. This was followed by his "Observations on Malarial Fever," which filled a space in the *Southern Medical and Surgical Journal*, of Augusta, Ga., for 1858-59, and by his "Observations on Some of the Physical, Chemical, Physiological and Pathological Phenomena of Malarial Fever." These latter observations were published in Vol. XII of the Transactions of the American Medical Association, and were published in Philadelphia in 1859. Subsequently appeared his "Suggestions on Medical Education;" "First Report to the Cotton Planters' Convention of Georgia on the Agricultural Resources of Georgia" (Augusta, Ga., 1860); "Investigations into the Diseases of the Federal Prisoners Confined in Camp Sumter, Andersonville, Ga.;" "Investigations into the Nature, Causes and Treatment of Hospital Gangrene, as it Prevailed in the Confederate Army" (New York, 1866); "Researches upon Spurious Vaccination in the Confederate Army" (Nashville, 1867); "Sanitary Memoirs of the War of the Rebellion" (New York, 1866-1868); "Mollities Ossium" (Philadelphia, 1869); "Outline of Hospital Gangrene in the Confederate Armies" (New Orleans, 1869); "Surgical Memoirs of War of the Rebellion" (New York, 1871); "Observations upon the Treatment of Yellow Fever" (Louisville, Ky., 1873); "General Conclusions as to the Nature of Yellow Fever" (New York, 1873); "Hospital Construction and Organization" (Baltimore, 1875), and "Explorations of the Aboriginal Remains of Tennessee," which was published by the Smithsonian Institution at Washington, in 1876. The last-named represents the author's principal contribution to the science of archeology. Articles and pamphlets discussing the modes of burial, burial caves, earthworks, mounds and relics of the Southern Indians have likewise been furnished by his pen. Several of these have appeared under the auspices of the institution to which we have just referred. The year 1876 was notable in the scientifico-literary career of the subject of this sketch. It marked the publication of the first volume of his "Medical and Surgical Memoirs," containing investigations on the geographical distribution, causes, nature, relations and treatment of various diseases, and embodying results to the attainment of which more than twenty years had been devoted. This initial octavo is well worthy of companionship with the volumes to which the atten-

tion of the medical profession has since been invited. As in the first, a large space is given to a study of the disease of the nervous system, so in all their phases receive exhaustive and discriminating consideration. The concluding volume of these Memoirs dates its appearance since 1890. It consists of two parts, the first being mainly a review of the endemic, epidemic, contagious and infectious diseases. In that part is likewise comprised a complete and satisfactory account of the quarantine and sanitary operations of the Louisiana State Board of Health during the presidency of the author. In the second part of the volume we are introduced to Prof. Jones' latter-day labors and researches, as recorded in a series of monographs, among which his "Philosophical Principles of Education and their Scientific Application to the Development and Perfection of Medical Science," takes foremost rank. As presiding officer of the Medical Society of Louisiana, he delivered this address in the spring of 1888. Other matters of interest and value to scientists and members of his profession are the papers treating of the "Relations of Quarantine to Commerce in the Valley of the Mississippi River," "Public and International Hygiene," and the "Progress of the Discovery of Disinfectants and their Application for the Arrest of Contagion." So much for a hurried glance at the general scope and contents of these medical and surgical memoirs. In them Dr. Jones, profiting by a long and varied experience as practitioner in the several branches of the healing art, and relying upon the resources of a mind replete with wisdom, enriched by reflection, and active in the pursuit of truth, has raised in honor of Æsculapius a memorial which dignified alike its maker and his God. Professor Jones' life has been devoted to the scientific investigation of the causes and means for the prevention of diseases in the daily round of private practice, in the civil and military hospitals, in the camp and prison, and on the battle field. During the war between the States he not only ministered to the treatment of the sick and wounded, but likewise thoroughly examined into the nature and conditions of measles, small-pox, hospital gangrene, pyæmia, and malarial fever—maladies so prevalent among, and which proved so destructive to Confederate soldiery. By careful study, moreover, he penetrated the causes of the great mortality amongst military prisoners, and suggested measures for their relief. The importance of his labors and the value of his services were fully recognized by the Confederate government, by which every facility was afforded for the prosecution of his inquiries. His observations and researches upon these matters have been rendered into type and form a unique chapter in the medical history of that eventful period. During his presidency of the board of health the quarantine and sanitary measures instituted and perfected by Doctor Jones were effectual in excluding yellow fever from the Valley of the Mississippi. When we consider the odds against which he was forced to contend, and the nature of the difficulties by which he was confronted, we can not fail to be impressed with the magnitude of his final triumph. On the one hand the demand of the epidemic, raging now at the quarantine station (Mississippi) then at Brownsville and

Pensacola, again at the Naval Reservation and Brewton, and always in the Vera Cruz, Havana, and Rio de Janeiro, sought to overmaster him in the struggle, and to lay hold upon the dominion of which he stood the ever-watchful guardian. On the other side, the gigantic maritime and railroad corporations, secure in their wealth and influence, attempted to crush him to the wall, and to impugn the legality of the principles of which he was the indomitable champion, but in the end he proved himself the victor. Yellow fever was met and thwarted at all points, and the Mississippi Valley remained untainted by the pestilence. The quarantine laws of Louisiana were sustained and their constitutionality was affirmed by the supreme tribunal of the United States. Dr. Jones has been twice married. On the 26th of October, 1858, he was united to Miss Caroline S. Davis, of Augusta, Georgia. His marriage to Miss Susan Rayner Polk, a daughter of the Right Rev. Leonidas Polk, Bishop of Louisiana and Lieutenant General in the Armies of the Southern Confederacy, occurred June 21, 1870. In the same year he went abroad, visiting England, France, and Wales, and making a careful tour of the hospitals and museums of those countries. The cordial reception tendered by Professor Richard Owen, late director of natural history in the British Museum, and the friendly courtesy shown him by eminent scientists, were very gratifying. Special opportunities for observation were afforded, and the ends with a view to which the journey had been undertaken were fully answered. That Professor Jones has felt a lively interest in, and been an earnest student of American archaeology, sufficiently appears from the fact that he was the author of "Explorations of the Aboriginal Remains of Tennessee." To his reputation as a writer on archaeology he unites the distinction of being an extensive collector. He has a valuable assortment of primitive objects, and his specimens from Mexico and Peru are exceptionally fine. His brother, Col. Charles C. Jones, Jr., of Augusta, Ga., the historian of the State, is likewise a familiar figure in the antiquarian world, and possesses notable collections. His "Antiquities of the Southern Indians, particularly of the Georgia Tribes," published in 1873, enjoys high repute on this continent and in Europe, and is generally regarded as the standard work upon the subject treated. Viewed as a whole, the life of Dr. Jones presents a panorama of varied and never-ceasing activity. We indulge in no extravagance when we affirm that his labors in the cause of medical education, and in behalf of sanitary science, are national in their character. As further evidence of this it may be stated that in the *Times Democrat* of October 5, 1890, appears this complimentary notice of the subject of the foregoing. "Dr. Benjamin Ward Richardson, F. R. S., of London, England, has dedicated the sixth volume of his original work, 'The Asclepiad,' to Dr. Joseph Jones, of New Orleans, M. D., LL. D., Professor of Chemistry and Clinical Medicine in the Tulane University of Louisiana; a model student of medicine, always seeking, always finding, always imparting with unwearied industry, new and useful knowledge to the great republic of medical science and art, this the sixth volume of 'The Asclepiad,' is sincerely dedicated." Dr. Richardson is the most eminent living British

original worker and authority in experimental therapeutics and practical hygiene. He has devoted his life to the elevation of the medical profession by his extensive original researches, and to the alleviation of the ills of humanity by his works on insanity and hygiene.

JONES, Samuel J., of Chicago, Illinois, was born at Bainbridge, Pa., March 22, 1836. "He is a son of Dr. Robert H. Jones, a native of Donegal, Ireland, who landed in Philadelphia in 1806, and graduated from the Medical Department of the University of Pennsylvania in 1830, and who practiced medicine in the Keystone State from that time up to the date of his death, in 1863. His mother's maiden name was Sarah M. Ekel, who came of one of the old families of the old town of Lebanon, Pa., and was a descendant of Marcus Ekel, a native of Zurich, Switzerland, who landed in Philadelphia in 1743. Having, from the time he was old enough to give his attention to books, had the best educational advantages, he was

prepared to enter college at an early age. He was matriculated at Dickinson College, Carlisle, Pa., and graduated with the degree of Bachelor of Arts from that institution, in 1857, when he was twenty-one years of age. Three years later he received the degree of Master of Arts from his *Alma Mater*, and in 1884, the honorary degree of Doctor of Laws was conferred upon him by the same institution." In a recent biographical sketch of Dr. Jones, written by H. L. Conard, and published in the *Magazine of Western History*, February, 1890, we find, that immediately after his graduation from Dickinson College, he began the study of medicine under the preceptorship of his father, and the following year he entered the Medical Department of the University of Pennsylvania, from which his father had graduated twenty-eight years earlier. In 1860, at the end of a three years' course of study, he received his medical degree from the university, and was ready

to begin the active practice of his profession. His attention had been attracted to the United States naval service, which he looked upon as an inviting field for the young practitioner, both on account of the professional advantages offered, and the opportunity which it would afford for adding to his stock of general information and knowledge of the world. With a view to entering that branch of the government service, he submitted himself to a competitive examination for the position of assistant surgeon in the navy, in which he was successful. He received his appointment a few months before the War of the Rebellion commenced, and a short time after the inauguration of President Lincoln, was ordered to the United States steam frigate *Minnesota*, which sailed under sealed orders from Boston, on the 8th day of May, 1861, as the flagship of the Atlantic blockading squadron. From the time she sailed out of Boston Harbor with banners flying, and salutes resounding from all quarters, until she returned to the same port twenty-one months later, for repairs, the fires in the *Minnesota* were not allowed to go down. During all that time she was in active service, her most hazardous experience being participation in the deadly conflict with the *Merrimac*, when the Cumberland and Congress fell victims to the rebel iron-clad, in the memorable engagement in Hampton Roads, on March 8, 1862. Assistant Surgeon Jones participated in the naval battle which resulted in the capture of the Confederate forts at Hatteras Inlet, in August, 1861, and which put a stop to the troublesome blockade running at that point. At the opening of that engagement an effort was made to land the forces on Hatteras Island, on which Forts Hatteras and Henry were located, but a storm came on and the vessels were compelled to put to sea, leaving 320 officers and men, the only ones who had been landed, entirely unprotected and within two miles of the Confederate forts, garrisoned by 1,500 men. It was night time, however, and the Confederates, supposing the entire force aboard the vessels had been landed, awaited all night under arms the attack which they expected would be made, and did not discover their error until the following morning, when the vessels of the squadron returned from sea and the engagement was renewed. Assistant Surgeon Jones was among those set ashore, and he has still a vivid recollection of that night's experience of the handful of men, left without food or ammunition, in sight of the enemy, and in momentary expectation of being captured and carried into the forts as prisoners of war. That was the first naval battle in history in which steamships were used and kept in motion while in action. The 1,500 prisoners captured as the result of the surrender of the forts, was the largest number of prisoners which had, up to that time, been captured in any engagement of the war. In this connection a digression will be permissible, for the purpose of putting into print a bit of probably unwritten history. It is well known that in this engagement the land forces connected with the expedition rendered no important service, but not so well known, perhaps, that in view of this fact, the Confederate commander, Commodore Barron, refused, after raising a flag of truce, to surrender to Gen. Butler, the ranking officer, until the latter had been delegated to receive the surrender by

Flag Officer Stringham, the officer commanding the naval forces. His reason for pursuing that course, expressed in very vigorous English, was that it was the naval and not the land forces which had compassed his defeat and made the surrender a necessity. After this engagement Assistant Surgeon Jones returned to duty on the *Minnesota*, and was aboard that vessel until a short time before the fight with the *Merrimac*. During this time it was known that the iron-clad war vessel was being fitted up at Norfolk, and that she would prove a formidable and dangerous enemy, the officers of the Union squadron were fully convinced. They also knew that the *Monitor* was being constructed, but what service she would be able to render was a question about which there was more or less difference of opinion. While hoping that they might be reinforced by a vessel which would at least be the equal of the *Merrimac* in naval conflict, the officers of the squadron had determined in any event to attack her whenever she should appear. So complete were the preparations which had been made on the *Minnesota* for an engagement, and so good was the discipline aboard, that on the darkest nights, with her 800 officers and men, the ship could be prepared for action within eight minutes from the time the enemy was sighted. The plan of attack which had been agreed upon, was to keep the vessels of the squadron in close proximity to each other, and when the *Merrimac* should make her appearance, the heavy frigates were to bear down upon her, and by "ramming" were to send her to the bottom at the risk of going down themselves at the same time. That in this way the iron-clad might have been destroyed, in her first engagement, is more than probable, had she not made her appearance at a time when the steamers were prevented from reaching her, because of low water on the intervening bar, and she was thereby enabled to engage them in detail. In January, just preceding this engagement, Assistant Surgeon Jones was again detached, this time to accompany the Burnside and Goldsborough expedition against Roanoke Island, as the surgeon of Flag-Officer Goldsborough's staff. After the capture of Roanoke Island, he was assigned to duty on the staff of Commander Rowan, in the expedition which resulted in the capture of Newbern, Washington, and other important points on the inner waters of North Carolina. Most of the service which he was called upon to render while connected with these expeditions was extremely hazardous, and many were the incidents of heroism which he witnessed among the brave seamen, who participated in the short but hotly contested engagements, which were a distinguishing feature of the squadron's operation. In one instance, at Roanoke Island, when he had passed under a galling fire from one vessel to another, to look after the wounded of a vessel that had no surgeon, a gallant gunner who had fallen at his post of duty, was the first to receive attention. Realizing that he was mortally wounded and had but a few minutes to live, the seaman said: "It's no use trying to do anything for me, surgeon; I've got to die, and it's hard because I leave a family behind; but as long as I've got to die, if they'll carry me to my gun, and let me fire one more shot I'll die in peace." After these expeditions Dr. Jones returned to

the Minnesota. Later he was with Lieutenant Cushing, of "Albermarle" fame, and Lieut. Lamson, a no less daring and intrepid officer, in their operations on the Nansemond River, which were designed to relieve the Union forces under command of Gen. Peck, then hemmed in by Gen. Longstreet's command at Suffolk, Virginia. In order to afford immediate relief to Gen. Peck, such boats as could be picked up were armed as well as they could be under the circumstances, and sent up the Nansemond, a narrow and tortuous stream, to participate in some of the hottest fighting of that campaign, and all things considered, to engage in a service about as perilous as any in which the naval forces took part during the war. In the spring of 1863, after two years of such service, Dr. Jones was assigned to duty at the naval rendezvous at Philadelphia. Whilst there he passed his second examination for promotion, and some months later was advanced to the grade of surgeon. He was then transferred to the naval rendezvous at Chicago, where in addition to his other duties, he was designated to act as examining surgeon of those wishing to enter the medical corps for duty in the naval service, in connection with the Mississippi river squadron. While stationed at Chicago, he had the unusual experience of examining and passing into the United States government service, over three thousand Confederate prisoners of war, who were thus liberated from Northern military prisons, after being regularly enlisted in the naval service. It is a fact not generally known that in 1863-64 a large number of the captured Confederates who were confined at Camp Douglas, Chicago, at Rock Island and Alton, Illinois, and at Columbus, Ohio, made application to the government to be enlisted in the Union service. Their representations were that they had been impressed into the Confederate military service; that they had not voluntarily taken up arms against the government, and that they preferred to fight for the Union and not against it. These men were not allowed to enter the military service, for the reason that they would have been exposed to the danger of being captured and executed as deserters by the Confederates, but the government availed itself of the proffered services to a considerable extent, though in a different way. Those who were physically incapacitated for the service were allowed to enter the navy and were placed aboard vessels sailing for foreign ports, a corresponding number of experienced men being thereby released from duty at those ports and brought back for active service. Before the Confederates were enlisted, their physical qualifications had to be passed upon favorably by the examining surgeon designated to act in that capacity. Surgeon Jones visited all the military prisons named for this purpose, and the government accepted these three thousand able bodied Southerners, who contributed their share to the suppression of the rebellion. In the summer of 1864 he was relieved from duty at Chicago, and ordered to report to Admiral Farragut, who was then in command of the West Gulf blockading squadron. His first assignment in that squadron was to the sloop-of-war Portsmouth, but after a little time he was detached and assigned to duty as surgeon of the New Orleans Naval Hospital, and purveyor of medical supplies for the squadron.

At that time yellow fever was prevalent to a certain extent in the squadron, and the careful attention given to sanitary matters during that period in the history of New Orleans, when the city was under military government, undoubtedly prevented the breaking out of a serious and disastrous epidemic, and taught the resident population a lesson which has since been kept in mind. The government military and naval surgeons made a careful study of the disease with the result that some interesting facts relating to its character were brought to light, or at least had much additional light thrown upon them. Among other things, the infectious rather than contagious character of the disease, if not for the first time brought prominently before the medical profession, was so clearly defined as to attract special attention. There were numerous cases of the disease in the naval hospital, and it was impossible to wholly separate the fever patients from others. In accordance with the hospital regulations they were stripped of their clothing, given a bath and fresh, clean clothing before being admitted into the wards with other sick and disabled inmates. Although sufferers from the scourge of the South were treated at the hospital during the closing months of 1864, and as late as January, 1865, it was noted that none of the patients who came in direct contact with them contracted the fever, while the assistant surgeon, whose duty it was to receive patients arriving, and the guard who received and disinfected their clothing, both fell victims to the disease. Within the hospital the fever was kept under perfect control, and there were no cases outside the quarantine established around it. In the fall of 1865, the war having ended, the naval hospital at New Orleans was closed, and Dr. Jones was ordered to Pensacola, Fla., as surgeon at the navy yard and naval hospital located there, where he remained until 1866, when he was ordered north and again assigned to duty at Chicago. After a time the marine rendezvous to which he was attached at Chicago was closed, and after awaiting orders for several months he was ordered east in 1867 and assigned to duty as surgeon of the frigate Sabine, a practice ship for naval apprentices, then cruising on the Atlantic coast. This was his last active duty in the naval service. Having determined to engage in private practice, he tendered his resignation, which was accepted on the 1st of March, 1868, after he had spent eight years in the navy and had participated in the active and trying service incident to the war period. He returned to Philadelphia, and having become a member of the American Medical Association, he was accredited a delegate from that body to the Medical Societies of Europe. At the same time he was commissioned by Gov. Geary to report upon hospital and sanitary matters in Great Britain and upon the continent of Europe, for the State of Pennsylvania. He attended during that year meetings of noted medical societies of Europe, held at Oxford, Heidelberg and Dresden. At the last-named place, during the meeting of the Association of German Physicians and Naturalists, held in September of 1868, the first Otological Congress ever held was organized, of which Dr. Jones was a member and in the deliberations of which, he participated. The remainder of that year he spent investi-

gating matters pertaining to medicine and surgery in different parts of Europe. At the end of the year he returned to the United States and came to Chicago, where he established himself in private practice. Prior to and whilst traveling abroad he had given special attention to that branch of the practice which deals with diseases of the eye and of the ear, and early in 1869, but a short time after he located in Chicago, he was made a member of the professional staff of St. Luke's Hospital, where he established a department for the treatment of these diseases, with which he has been connected since that time. In 1870 he was again accredited a delegate from the American Medical Association to similar foreign associations, and he again went abroad to spend some time in research and investigation. The same year a Chair of Ophthalmology and Otology was created in Chicago Medical College, the medical department of Northwestern University, and Dr. Jones accepted the new professorship tendered to him, which he has ever since held. For purposes of clinical instruction in the college, he started an eye and ear department in Mercy Hospital, and also in the South Side Dispensary, both of which departments he conducted for about ten years. He was also, for several years, one of the surgical staff of the Illinois Charitable Eye and Ear Infirmary. Although he was for some years a member and president of the Board of Examining Surgeons for United States pensioners in Chicago, he has not been engaged in general practice since 1870, but has confined his work exclusively to the treatment of those diseases which require the attention of the oculist and aurist. Referring to the abilities of Dr. Jones as a physician, a writer and educator, his biographer, previously quoted, in the "Magazine of Western History," says that for more than twenty years he has been identified with the medical profession and medical institutions of Chicago. A practitioner of more than local renown, he is known to the public generally as a skillful operator within the special field to which he has for many years given his attention, and to the profession as a man of broad culture, with a thorough knowledge of the principles and practice of medicine, who has labored earnestly and assiduously through the various associations and societies with which he is connected, as well as through the press, to elevate medical education to the highest available plane; to stimulate practitioners to put forth their best efforts to keep pace with the developments of medical science, and to improve in a general way the character and standing of the profession to which he belongs. For several years he was editor of the *Chicago Medical Journal and Examiner*, which represented the consolidation of two journals formerly published in that city, and which has held a front rank among the medical publications of the country. His contributions to medical literature through this and other similar channels have been numerous. He had received a liberal literary and medical education, and before he commenced the practice of medicine in Chicago this had been supplemented by years of medical and surgical practice in a field which afforded the best facilities for study and investigation, and also by the professional and general knowledge gained through foreign travel under circumstances which gave him

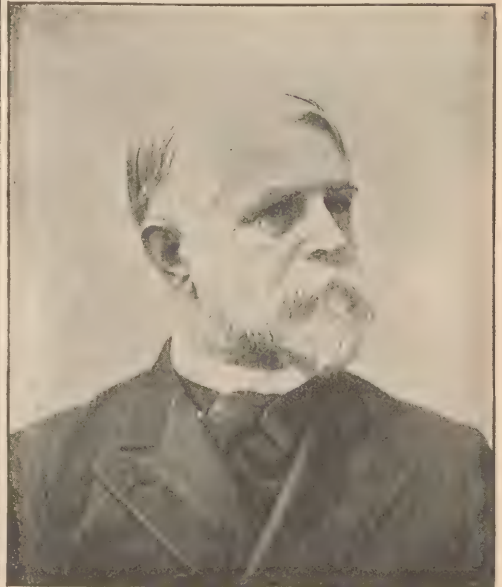

the *entree* to the most renowned medical associations and societies of Europe. Few Western physicians have participated so actively as has Prof. Jones in the deliberations of noted gatherings of medical men from all parts of the world. In 1876 he was a delegate from the Illinois State Medical Society—of which he became a member in 1869—to the Centennial International Medical Congress which met in Philadelphia. In 1881 he was a delegate from the American Medical Association and the American Academy of Medicine to the seventh International Medical Congress, held in London. As president of the section of otology in the Ninth International Medical Congress, held in Washington in 1887, he was *ex-officio* a member of the executive committee, upon which devolved the responsibility of making the preparations for the congress and the entertainment of foreign delegates. At the meeting of the American Academy of Medicine at Chicago, in 1890, Dr. Jones, who had previously served two terms as vice-president, was elevated to the presidency of that organization. At all these important conventions of medical men he has been an active, working member, and has become noted for his capacity to do a large amount of work without ever appearing to be uncomfortably hurried. Dr. Jones has been Ophthalmic and Aural Surgeon to St. Luke's Hospital, Chicago, since 1869, and a member of the Chicago Academy of Sciences since 1868. In his private practice he has been conspicuous for his devotion to the welfare of his patients, and in the public professional positions which he has occupied, and in the various medical organizations of which he is a member, he has been not less conspicuous for his labors in behalf of the elevation of his profession. He has never participated actively in political life, and has made no effort to attain any prominence other than that which might come to him as the reward of painstaking and conscientious professional labors, in varied fields, which have afforded unusual opportunities for exceptional experience.

JOSEPHI, Simeon Edward, of Portland, Oregon, was born in the city of New York, December 3, 1849. His father, Edward Josephi, was a native of St. Petersburg, Russia; his mother was an English woman. Dr. Josephi spent his early life in New York, where he received his literary education, chiefly in the public schools. In 1863 he graduated from the Grammar School, and entered the New York College, on Lexington avenue. After pursuing his studies there for a year, he accepted a clerkship in a mercantile house, but being possessed with a desire to see the great West, he went to California, in 1866. In January, 1867, he went to Portland, Ore., and there commenced the study of medicine at the Oregon Hospital for the Insane and County Hospital. In 1869, he went to New York for the purpose of entering Bellevue; but a question arose involving a sacrifice of convictions and principles, and rather than renounce them for financial profit he was compelled to abandon his object. Resolved to obtain his degree, he worked at clerical employment for six years, and having saved money for the purpose, he matriculated in 1876, at the Medical Department University of California, from which he received his degree in November, 1877. Returning to Oregon,

he accepted the position of Assistant Physician to the Oregon Hospital for the Insane, under his old friend and preceptor, Dr. J. C. Hawthorne. In which position, and in the general practice of his profession, he continued until the death of Dr. Hawthorne, in February, 1881, when he succeeded his late chief as superintendent. He continued in charge until October, 1883, when the insane were transferred from this institution to the new asylum at Salem. He then entered into general practice at Portland, and so continued until May 1, 1886, when he accepted the superintendency of the State Insane Asylum, at Salem, Ore. This position, for political reason, he resigned in July, 1887, returning to Portland, he again entering into general practice. During the professional career of Dr. Josephi, he has occupied various educational positions. In 1879, he was elected Professor of Anatomy and Psychology in the Medical Department of Willamette University. In 1881, at his own request, he was transferred to the Chair of Obstetrics in the same college. At the reorganization of this college, in 1887, he was offered the chairs of anatomy and obstetrics, but declined both. Later in the year 1887, the Medical Department of the University of Oregon was chartered, and Dr. Josephi accepted the Professorship of Obstetrics and Psychology. At the final organization, in the fall of 1887, he was elected dean of the Medical Faculty, to which position he has been re-elected each succeeding year, and which he now occupies. He is a member of the Oregon State Medical Society, of which body he was president in 1884; and he was also president of the Portland Medical Society in 1885. He is one of the trustees and a member of the medical and surgical staff of the Good Samaritan Hospital.

JUDSON, Adoniram Brown, of New York City, was born at Maulmain, Burmah, April 7, 1837. He was the eldest son of the missionary, Adoniram Judson, and a descendant of William Judson, who came from Yorkshire, England, to Massachusetts Bay in 1636. He graduated at Brown University in 1859, receiving the Masters' Degree on the day of graduation, as was the custom under the rule established by President Francis Wayland. Becoming a post-graduate student to the University, he began the study of medicine in the office of Dr. A. H. Okie, of Providence, and continued it in the recitations held at the Harvard Medical School by Drs. H. J. Bigelow and O. W. Holmes, and under the preceptorship of Drs. J. H. Brinton and J. M. Da Costa, at the Jefferson Medical College in Philadelphia. He was commissioned as assistant surgeon in the United States Navy by President Lincoln in 1861, after passing the official examination, and before completing his medical studies or receiving the degree of Doctor of Medicine. He was promoted to past assistant surgeon in 1864, and received the degree of Doctor of Medicine from the Jefferson Medical College in 1865. He was commissioned surgeon in the navy in 1866. In 1868 he received the degree of Doctor of Medicine, *ad eundem*, from the College of Physicians and Surgeons, and resigned from the navy to settle in New York. In 1869 he was appointed inspector in the health department under the superintendency of Dr. Elisha Harris, and served as assistant superintend-

ent before resigning office in 1877. His practice has been strictly limited to orthopedic surgery since 1875, after he had been the pupil for a year of Dr. Charles Fayette Taylor. From 1877 to 1884 he was secretary of the New York Board of Examining Surgeons for Pensions. His contributions to literature have been chiefly confined to matters connected with the public health and the theory and practice of his specialty. His public health writings include: Reports on the "Course of the Epizootic among American Horses in 1872 and 1873" and on the "History of Asiatic Cholera in the Mississippi Valley in 1873." He contributed an original study of the "Cause of Rotation in Lateral Curvature of the Spine," to the Transactions of the New York Academy of Medicine in 1876. Among his numerous other orthopedic papers may be enumerated the following: "Ischiatic Support of the Body

A. B. Judson

in the Treatment of Joint Diseases of the Lower Extremity," 1881; "Practical Inferences from the Pathological Anatomy of Hip Disease," 1882; "The Rationale of Traction in the Treatment of Hip Disease," 1883; "Criticism of Certain Theories of the Cause of Rotation in Lateral Curvature," 1884; "The Management of the Abscesses of Hip Disease," 1885; "Treatment of White Swelling of the Knee," 1886; "The American Hip Splint," 1887; "Practical Points in the Treatment of Potts' Disease of the Spine," 1888; "More Conservatism Desirable in the Treatment of the Joint Diseases of Children," 1889; "The Rotary Element in Lateral Curvature of the Spine," 1890; "Orthopedic Surgery as a Specialty," The President's Address before the American Orthopedic Association, delivered at Washington, D. C., 1891; "The Weight of the Body in its Relation to the Pathology and

Treatment of Club-Foot," translated into French, German, Italian and Spanish, 1892.

KANE, Elisha Kent, of Philadelphia, Pa., was born in that city February 20, 1820, and died in Havana, Cuba, February 16, 1857. His father was an eminent jurist, and president of the American Philosophical Society. The subject of this sketch attended the University of Virginia, but when seventeen years of age was compelled, on account of illness, to abandon an elective course at that institution. Improving in health, he applied himself so diligently to the study of medicine that when but twenty-two years of age he graduated M. D. with the highest honors of his class at the University of Pennsylvania. The following interesting details relating to the life and achievements of this noted member of the medical profession are derived from Appleton's *Cyclopedia of American Biography*: In 1843, Dr. Kane entered the United States Navy as an assistant surgeon, and was promoted to be past assistant surgeon in 1848. He served as surgeon in China, on the coast of Africa, in Mexico (where he was wounded while on special service), in the Mediterranean, and on coast survey duty in the Gulf of Mexico, from which he was relieved, at his urgent request, for duty with the first Grinnell Arctic expedition. In all his service he eagerly sought opportunity for travel, exploration and adventure, and once, in descending into the crater of Teal, in the Philippines, he barely escaped with his life. His experiences included six months of practice as physician in China, an encounter with Bedouin robbers in Egypt, and a visit to the King of Dahomey, in Africa. Kane prepared for his Arctic voyage in two days' time, and sailed as surgeon of the *Advance*, under Lieut. Edwin J. DeHaven, who commanded the squadron, the *Advance* and the *Rescue*. These vessels, purchased, strengthened and fitted out through the liberality of Henry Grinnell, were accepted by the United States, under the joint resolution of Congress, approved May 5, 1850, for the purpose of assisting in the search for the English expedition under Sir John Franklin. The squadron discovered "Grinnell Land," an island north of Cornwallis Island, which should not be confounded with the better known Grinnell Land bordering on the frozen sea. Failing to reach an advantageous point for farther search, DeHaven decided to return home the same year, but his vessels were closely beset by the ice in Wellington's Channel, and drifted from September, 1850, till June, 1851, southeasterly into Baffin's Bay, where they finally escaped from the pack. Dr. Kane's exertions and medical skill did much to mitigate the ills of the scurvy-stricken squadron and bring back the party with undiminished numbers. His reputation as an Arctic explorer depends almost entirely upon his second expedition, which was undertaken at the solicitation of Lady Franklin in a search for Franklin and his companions. The expedition contemplated an overland journey from Baffin's Bay to the shores of the Polar Sea. Kane sailed May 30, 1853, from New York, in command of the brig *Advance*, which Henry Grinnell had placed at his disposal. George Peabody contributed liberally, while various scientific societies of the country also fostered the undertaking. Dr. Kane not only spent much of his private means, but, through strenuous exertions, suc-

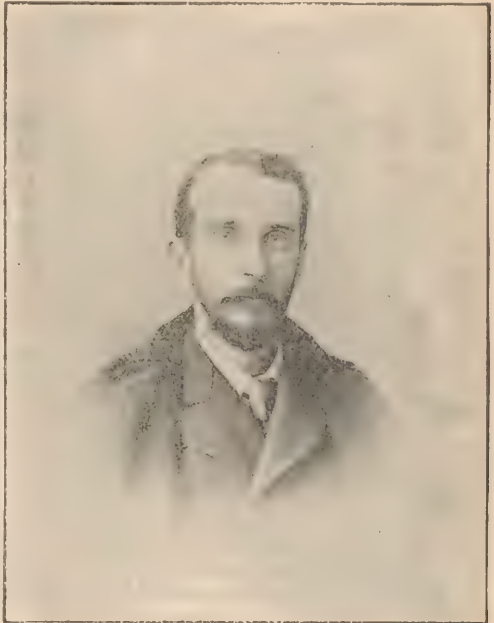

ceeded in sailing under the auspices of the United States Navy Department, although Congress failed to aid him. Dr. Isaac I. Hayes went as surgeon of this expedition. The *Advance* touched at various Greenland ports, where Esquimaux recruits were obtained, and finally, by following the bold coast of Smith Sound, reached 78° 43' north, the highest latitude ever attained, even to this day, by a sailing vessel in that sea. Unable to proceed farther, Kane wintered in Van Rensselaer harbor, 78° 37' north, 70° 40' west. Short journeys that autumn resulted in the discovery of Humbolt glacier which issuing at its southern edge from the great *mer-de-glace* of Greenland in 79° 12', extends northward many miles. An attempt to push northward along the glacier in the spring of 1854, resulted only in the loss of two lives and the maiming of two other persons. Later Morton with Esquimaux Hans, reached by dog-sledge Cape Constitution in 80° 35' north, June 21, 1854, from which point the southwesterly part of Kennedy channel was seen to be entirely open and free from ice. Dr. Hayes with dog-sledge crossed Kane sea and reaching Cape Hawkes, Grinnell Land, pushed northward to the vicinity of Cape Frazier 79° 45' north. The ice remaining unbroken near his winter quarters, Dr. Kane in July, 1854, made an unsuccessful attempt by boat to visit Beechy island, about 400 miles distant, whence he hoped to obtain assistance. Later that year half the party, under the command of Peterson, a Dane, abandoned Dr. Kane and the brig in an attempt to reach Upernavik, but after three months of extreme hardship and suffering, were obliged to return to Kane, who received them kindly. In 1855 Kane was reluctantly forced to abandon the "*Advance*" which was yet frozen in. By indefatigable exertions he succeeded in moving his boats and sick some sixty miles to the open sea, losing one man on the way. During this journey he received much aid and kindness from the Etah Esquimaux. He reached Cape York July 21, and crossing Melville bay, successfully arrived at Upernavik August 6, 1855. This second voyage of Dr. Kane greatly enlarged the world's knowledge of the Etah Esquimaux, and added to geography the most northern lands of that day, while the scientific observations were more accurate and valuable than those of any preceding polar expedition. The explorer and his companions were received with enthusiasm. On their return Arctic medals were authorized by Congress and the Queen's medal was presented to officers and men. Kane received the founders' medal of 1856 from the Royal Geographical Society, and the gold medal of 1858 from the Société de Géographie. His health had been much impaired by the sufferings of his second expedition. In the hope of recovering it he visited England and then went to Havana, Cuba, where his illness terminated fatally. His remains were taken to Philadelphia and accorded civil and military honors. Dr. Kane published "*The United States Grinnell Expedition*," 1854; and "*The Second Grinnell Expedition*," 1856.

KEARSLEY, John, was born in England about 1692, and died in Philadelphia, Pa., in January, 1772. He was educated in London for the medical profession, Dr. Carson writes, that in the progress of time the inhabitants of

the thriving and extended colony established in this country by William Penn became so numerous as to require an additional number of medical attendants. In response to this demand, Dr. Kearsley arrived and settled in Philadelphia, Pa., in 1711, where he became eminent in his profession. He served for many years in the Assembly of Pennsylvania, became a vestryman of Christ's Church, in 1719, and continued to serve in this capacity, or as warden, until his death. Being known to possess skill and taste in architecture, he was selected by this church, in 1727, to direct the remodelling and enlarging of their edifice, which work he performed under plans drawn by himself. The building, at the time of its erection, surpassed any thing of the kind in this country. In 1729, he was one of the committee appointed by the Assembly to select a site and prepare plans for a state-house (afterward Independence Hall). He was the founder of Christ's Church Hospital, having by his will bequeathed a large estate for this purpose, the design of which is to afford a comfortable home for respectable aged indigent females. By judicious management this benefaction has proved a munificent one. Dr. Kearsley, throughout his career, was extensively engaged in the practice of medicine and surgery. He was a favorite of the people, and as a member of the House of Assembly, after advocating their interests in debate, was often carried to his home upon their shoulders. On the completion of Christ's church, May 11, 1747, the vestry passed a vote of thanks, and ordered a piece of plate of the value of forty pounds to be given to Dr. Kearsley, as a lasting testimonial and acknowledgment of his services. He had not only superintended the building from the commencement to its finish, but often advanced large sums of money to defray the expense of materials and the bills of workmen. He was the author of "A Letter to a Friend, Containing Remarks on a Discourse Proposing a Preparation of the Body for the Small-pox," Philadelphia, 1751; and, "The Case of Mr. Thomas," 1760. He was the medical preceptor of many students, who afterwards became renowned in the annals of the profession. He died at the advanced age of eighty years, and was succeeded in practice by his son.

KEATING, John M., of Colorado Springs, Colo., was born in Philadelphia, Pa., April 30, 1852. He is the son of Dr. William V. Keating, of Philadelphia, formerly Professor of Obstetrics at the Jefferson College, and Susan La Roche, daughter of Dr. René La Roche, a well-known physician of Philadelphia, and author of works on "Yellow Fever." He received his preliminary education at Roth's Academy, in his native city, and at Seton Hall College, South Orange, N. J., and afterwards attended the Polytechnic College (engineering), in Philadelphia, for two years. Always desirous of studying medicine, he matriculated at the medical department of the University of Pennsylvania, as the office student of William Pepper, and graduated at that institution in 1873, receiving the \$100 prize for his thesis upon the "Physiological Action of Ergot." In the same year he became interne at the Philadelphia Hospital (Blockley), and after serving the required term, and upon entering into practice in Philadelphia, was selected a Visiting Physician to that well-known institution.

He was soon after transferred to the obstetrical and children's departments, and for fifteen years delivered clinical lectures on the diseases of women and children. During this time many of his lectures and experiences were published in the journals and society reports. He was Lecturer on Diseases of Children in the University of Pennsylvania until his resignation in 1880, and was also for a time Professor of the Principles and Practice of Medicine at the Woman's Medical College of Philadelphia. In 1878 he married the eldest daughter of the Hon. Peter McCall, of Philadelphia. In January, 1879, he joined General Grant in Paris, together with the late Hon. A. E. Borie, ex-Secretary of the Navy, and became the physician of the party during Gen. Grant's tour through Egypt, India, Burmah, Malacca, Penang, Johore, Singapore, Siam and China. Leaving the party at Shang-

John M. Keating.

hai, he visited Japan, with Mr. Borie, who was obliged to leave China and return home on account of failing health. He was elected Medical Director of the Penn Mutual Life Insurance Company, of Philadelphia, in April, 1881, and actively managed the company's medical department until he was obliged to permanently locate in Colorado, in 1891, on account of his health. Dr. Keating is a member of the American Gynecological Society. He served for several years as Gynecologist to St. Joseph's and St. Agnes' Hospitals, Philadelphia. He was president of the Association of the Medical Directors of Life Insurance Companies, and is now an honorary member of that body. He is first vice-president of the American Pediatric Society, and chairman of the Section on Diseases of Children for the Pan-American Medical Congress of 1893. In 1892 the honor of LL. D. was conferred upon him by Seton Hall College. In 1887 he was

elected a Fellow of the College of Physicians of Philadelphia. In 1890 his health became impaired by acute illness, and he was obliged to go to Colorado, where he has since practiced his profession, giving exclusive attention to gynecology and literary work. He contributed articles to Pepper's System of Medicine, Buck's Reference Hand-book, Cyclopedia of the Diseases of Children, and Sajou's Annual of the Universal Medical Sciences. He has written the following books: "With General Grant in the East," 1880; "The Mother's Guide in the Feeding and Management of Infants," 1881; "Maternity, Infancy and Childhood," 1887; "Diseases of the Heart and Circulation in Infancy and Adolescence" (with Dr. W. A. Edwards), 1888; "How to Examine for Life Insurance," 1890; "Mother and Child" (with Dr. E. P. Davis), 1892; "A New Pronouncing Medical Dictionary" (with Henry Hamilton), 1892. He is editor of the *International Clinics*, and of the *Climatologist*. Probably his best known work is the "Cyclopedia of the Diseases of Children" (medical and surgical), which he originated and edited. This is considered a standard authority on these subjects. (Dr. Keating died November 17, 1893.)

KEATING, William V., of Philadelphia, Pa., was born in that city April 4, 1823. His father, Baron John Keating, a knight of St. Louis, emigrated to this country from France, and was afterward married to a French lady. The subject of this sketch was graduated at St. Mary's College, Baltimore, in 1840; studied medicine at the University of Pennsylvania, graduating M. D. in 1842. After receiving his medical degree he settled in Philadelphia, his native place, and has ever since remained there. He is a member of the College of Physicians, American Philosophical Society, Academy of Natural Sciences, and a member of the County Medical Society. He has been the American editor of "Ramsbotham's Midwifery" and "Churchill on Diseases of Women," and has always made a specialty of diseases of women. He first introduced the colpeurynter as an artificial bag of water in labor. For ten years he taught in a summer medical school; in 1860 was elected Professor of Obstetrics in the Jefferson Medical College in place of Dr. C. D. Meigs, but was compelled by the failure of his health to resign in a few months. He has also served for many years as physician to St. Joseph's Hospital and St. Joseph's Orphan Asylum. For three years, from 1862, he was medical director of the United States Army Hospital at Broad and Cherry streets; previous to that he was connected with the staff of the Satterlee Hospital in Philadelphia. Dr. Keating has been one of the prominent physicians of Philadelphia for a half century.

KEEN, William W., of Philadelphia, was born in that city, January 19, 1837. He graduated successively from the Philadelphia High School, in 1853; Brown University, in 1859; and Jefferson Medical College, in 1862. In May, of the latter year, he entered the United States Army as acting assistant surgeon, serving until July, 1864. During this period he was in charge of the Ascension and Eighth Street General Hospitals, at Washington, and subsequently of the United States Army Hospital for Nervous Diseases, at Turner's lane, Philadelphia. From 1864 to 1866 he studied at leading medical schools in Europe, returning

in 1866 to America, and establishing himself in Philadelphia. He was appointed, immediately upon his return, lecturer upon Pathological Anatomy to Jefferson Medical College, a position that he held for many years. During the same period he conducted the Philadelphia School of Anatomy, lecturing upon anatomy and operative surgery to the largest private class ever assembled in this country. He has also lectured upon artistic anatomy, and was Professor of Artistic Anatomy at the Pennsylvania Academy of the Fine Arts. He is now Professor of Principles of Surgery in the Jefferson Medical College. He is a member of the College of Physicians; of the Pennsylvania Academy of the Natural Sciences, and of the Pathological Society—of the last-named he served as secretary from 1869 to 1872. He was elected a trustee of Crozer Theological Seminary, in 1867, of Brown University, in 1873, and a manager of the American Baptist Publication Society in 1872. He has for several years been a contributor to the literature of his profession, writing extensively for medical periodicals, and also publishing a number of works. Among the latter may be instanced the following: "On Reflex Paralysis;" "Gun-shot Wounds and Other Injuries of Nerves;" "A Sketch of the Early History of Practical Anatomy;" "History of the Philadelphia School of Anatomy;" "The Surgical Results of Continued Fevers," and reprints, edited and enlarged, of Heath's "Practical Anatomy," and Flower's "Diagrams of the Nerves of the Human Body;" besides which he has edited "Gray's Anatomy," 1887, and other important works.

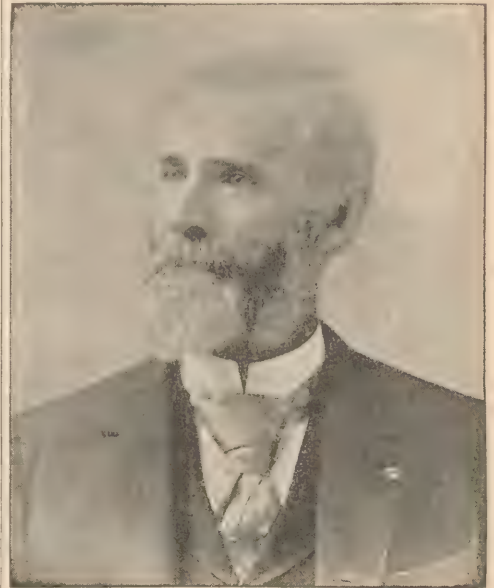

KEILLER, William, of Galveston, Texas, was born in Midlothian, Scotland, July 4, 1861. He was educated in Perth Academy, and afterwards in Edinburgh University, and studied medicine in that institution and the Edinburgh Medical School. While a student he obtained the senior silver medal for practical anatomy and was Pattison prize-man for the best mounted dissection. He was successively prosector, junior and finally second senior demonstrator of anatomy to Dr. Macdonald Brown, from whom he received his anatomical training. In July, 1888, he obtained the conjoined diploma of the Royal College of Physicians and Surgeons of Edinburgh, and of the Faculty of Physicians and Surgeons of Glasgow, and in July, 1890, was elected Fellow of the Royal College of Surgeons of Edinburgh. He has been successively, demonstrator of pathology under Dr. Alex Bruce; House Surgeon at the Edinburgh Royal Infirmary, and Chloroformist to the Edinburgh Dental Hospital. He was assistant medical officer, and afterward physician for diseases of women to the Edinburgh Provident Dispensary. In 1890 he was appointed Lecturer on Anatomy in the Edinburgh Medical School and elected Fellow of the Edinburgh Obstetrical Society. Dr. Keiller now holds the Professorship of anatomy in the Medical Department of the University of Texas.

KEMP, William M., of Baltimore, Md., was born in Frederick county, Md., February 21, 1814, and died September 6, 1886. He graduated at the University of Pennsylvania M. D. in 1834, and located himself first in Frederick City, Md., and finally settled in Baltimore in 1839. He was a member of the Medical and Chirurgical Faculty of Maryland, and was its

vice-president; was President of the Board of Health of Baltimore from 1855 to 1861, and during the year first named repeatedly visited Norfolk, where the yellow fever was then raging. A careful study of this and comparison with the same visitation in Baltimore in 1819, led him to the conclusion that it was non-contagious. His associates in the board, Drs. Jacob W. Houck and Judson Gilman, concurring in this view, the board at once determined not to quarantine the vessels plying between Norfolk and Baltimore for transportation of passengers, thus affording refugees abundant opportunity to escape. The Bay line of steamers between Norfolk and Baltimore made their usual daily trips. A number of refugees were seized with the fever after their arrival in Baltimore, a large proportion of whom recovered. Although these persons sickened in different sections of the city, there was not one instance in which members of the families, physicians or nurses contracted the fever. There were no hasty burials of those who died. All the facts here unmistakably proved the non-contagiousness of the fever, and the action of the board of health throughout the season was accordant with this view. Baltimore was the only port in communication with Norfolk, where quarantine was not enforced. This solitary action of the board of health evoked much criticism at the time, and committees from several of the seaboard cities visited Baltimore, to confer with the board and to remonstrate against their proceedings. The board continued their arrangements throughout the epidemic, and the results demonstrated the correctness of their position. An extensive correspondence with boards of health in many of the cities revealed the fact, that the quarantine regulations in the different ports were not based on the same general principles, each port having its own special ideas, and the quarantine being managed according to the peculiar views of the locality. Hence arose the call for a general meeting of delegates from corporations, boards of health, merchants' exchanges, medical associations, and all bodies directly interested in the subject of quarantine laws and their proper execution. This meeting convened in Philadelphia in 1857 and became The National Quarantine and Sanitary Association," which held annual conventions until the year 1860, when the war occurred and prevented subsequent conventions. The association had held conventions in Philadelphia, Baltimore, New York and Boston, and gave to the public a great mass of valuable matter on the subject. Dr. Kemp was president of the second convention. He was the author of various articles in the medical and surgical journals throughout the country, also of a monograph entitled: "Obstetrical Notes Based on One Thousand Cases of Delivery." In 1883 he was elected President of the Baltimore Medical and Chirurgical Faculty. He continued to practice his profession until his death and was one of the oldest and most widely known physicians of Baltimore. His son, Dr. Wm. F. A. Kemp, is now one of the prominent physicians of that city.

KEMPER, G. W. H., of Muncie, Ind., was born in Rush county, that State, December 16, 1839. His parents, Arthur S. and Patience (Bryant) Kemper, were natives of Kentucky, and were of German descent. He received a

common school education, and worked for two years in a country printing office. At the age of twenty-one years he entered upon the study of medicine, in the office of the late J. W. Moodey, M. D., at Greensburg, Ind. He had read but a few weeks when the tocsin of war was sounded, and President Lincoln called for 75,000 volunteers. He enlisted and served as a private in Company B, Seventh Regiment Indiana Volunteers, during the three months' service. On September 25, 1861, he re-enlisted as hospital steward of the Seventeenth Regiment Indiana Volunteers, and served in that capacity until February 20, 1863, when he was promoted to assistant surgeon of the same regiment, a position he filled until the expiration of his term of enlistment, July 27, 1864, when he was discharged. During the winter of 1864-65, he attended a course of medical lectures at the University of Michigan, at Ann Arbor, and in the spring following, a second

G. W. H. Kemper.

course at the Long Island College Hospital, at Brooklyn, N. Y., where he graduated, in June, 1865. The same year he located in Muncie, where he has since been engaged in the general practice of medicine. He was coroner of Delaware county, Ind., from 1870 to 1875. He was appointed examining surgeon for pensions in May, 1872, and has served in that capacity for a period of nearly twenty years. He is a member of the Delaware County Medical Society, the Indiana State Medical Society and the American Medical Association. In 1879, he was elected treasurer of the Indiana State Medical Society, and filled that position until 1886, when he was elected president of that society, and presided at the session of 1887. He has contributed more than fifty articles on medical subjects, among which may be named the following: "Operation for the Radical Cure of Varicocele;" "Exophthalmic Goitre;" "Retention in Utero of the Dead Fetus, Considered Particularly with Regard to

its Effects upon the Mother;" "A Case of Podelcoma"—the only case reported in the United States; "Affections of the Gall-bladder, Tending to Result in Cutaneous Biliary Fistula;" "Incarceration of the Placenta at Full Term;" "Ligation of the Femoral Artery;" "Primary Cancer of the Lung;" "A Case of Lodgment of a Breech-pin in the Brain—Removal on the Second Day—Recovery;" "A Study of the Subject of Spontaneous Rupture of the Membranes at Full Term of Gestation Preceding the Beginning of Labor;" "A Case of Painful Paraplegia;" "Antiseptics in Normal Labor;" "Synchronous, or Double Amputations;" and "One Thousand Cases of Labor and their Lessons."

KEYES, Edward L., of New York City, was born in Charleston, S. C., August 28, 1843. He is the son of Gen. Erasmus Darwin Keyes, of the United States Army. He was educated by private tutors at Taunton, Mass.; entered Yale in 1859, becoming a member of the principal class societies, and was graduated in 1863, taking the degrees then and later of A. B. and A. M. His degree of Doctor of Medicine was received from the medical department of the University of New York, in 1866. The following eighteen months were spent in Europe, where he continued his professional studies, mainly in the hospitals of Paris, paying especial attention to genito-urinary, venereal and skin diseases. In the latter part of 1867 he returned to America and established himself in New York City. In 1870 he became associated in practice with Prof. W. H. Van Buren. In 1871 he was appointed Lecturer on Dermatology and Instructor in Genito-Urinary Surgery in Bellevue Hospital Medical College, and soon after held the professorship of these branches in that institution. His rise to prominence in the profession has been rapid and uninterrupted, and in his special field he stands foremost. He is, or has been, president of the New York Pathological Society, New York Dermatological, American Association of Neurology and Syphilology, and vice-president of the New York Academy of Medicine; is Consulting Surgeon to the Bellevue, Charity, Skin and Cancer, and Italian Hospitals, and Surgeon to St. Elizabeth Hospital. He has been an extensive writer of books and monographs on medical and surgical subjects, among which may be named "Syphilis of the Nervous System," 1870; "Galvano-Puncture of Abdominal Aneurism," 1871; "Tonic Treatment of Syphilis," 1877; "Genito-Urinary Surgery," 1874; "Effect of Mercury in Increasing the Number of Red Blood Cells;" the section on "Urinary Calculus," in Ashurst's Encyclopedia of Surgery, and numberless essays. So widely is Dr. Keyes known that he is constantly called to all parts of the country to operate or to consult.

KEYSER, Peter D., of Philadelphia, Pa., was born in that city February 8, 1835. His family is of German origin, and at the time of the Reformation its then representatives were among the first to accept the doctrines of Luther, in consequence whereof Leonard Keyser was publicly burned at the stake at Scharding, Bavaria, in August, 1527. The family then moved to Holland on account of the religious persecution; from whence Dirck Keyser emigrated to America in 1688, being one of the first settlers at Germantown, Philadelphia. Maternally Dr. Keyser is a descendant of Col.

J. Eyre, of Kensington, who commanded the Philadelphia artillery during the revolutionary war. After receiving a collegiate education in the Delaware College, which terminated in 1852, he studied chemistry for two years in the laboratory of Dr. F. A. Genth, in Philadelphia, publishing several analyses in the *American Journal of Sciences*, and which were subsequently incorporated into "Dana's Mineralogy." After this he went to Europe to pursue his professional studies in Germany, returning to America in 1858. Upon the breaking out of the Civil War he entered the government service as captain in the Ninety-First Pennsylvania Regiment, and served in the Army of the Potomac in the Chickahominy campaign, until after the battle of Fair Oaks. His health being greatly impaired by wounds and sickness, he resigned his commission, and for purposes of recuperation and study again visited Europe. Entering the medical department of the University of Munich, and afterwards that of Jena, where he graduated M. D. in 1864, and after visiting the hospitals of Berlin, Paris, and London, returned to this country in the same year. He was appointed acting assistant surgeon in the United States service, and was detailed to the Cuyler Hospital at Germantown. In 1865 he resigned from the service in order to enter upon private practice, and that he might be enabled to fill the position of surgeon in charge of the Philadelphia Eye and Ear Hospital. This institution, incorporated in 1869 as the "Philadelphia Eye and Ear Infirmary," he had founded in 1864, having especially directed his studies toward ophthalmology while abroad. In 1868 he delivered a course of lectures to physicians upon the accommodation and refraction of the eye, and in 1870 delivered the first regular course of clinical lectures upon ophthalmology ever given in Philadelphia—a course continued in 1871–72. He was elected ophthalmic surgeon to the medical department of the Philadelphia German Society in 1870. Several other positions to which he was elected by prominent benevolent institutions, he was for want of time compelled to decline. He is at this date (1893) Dean and Professor of Ophthalmology in the Medico-Chirurgical College of Philadelphia, and has been surgeon to Wills' Eye Hospital for the past twenty years. He has contributed largely to professional periodicals, both in Europe and America; his most noteworthy papers being: "On Persistent Pupillary Membranes;" "On the Measurement of the Prominence of the Eye, with a New Instrument Therefor;" "Reports on Cataract Operations;" "On an Instrument for Measuring the Face and Nose for Fitting Spectacle Frames, and a New Scheme for Recording Cases of Refraction;" "Impairment of Vision the Result of Dental Irritation;" "On Air as an Anesthetic in Ophthalmology;" "On Sympathetic Ophthalmia;" "On Ametropia being a Cause of Blepharitis." He is a member of the Philadelphia County and Pennsylvania Medical Societies, of the American Medical Association, and of the International Ophthalmological Congress and of the Pennsylvania Historical Society.

KIERNAN, James G., of Chicago, Ill., was born in New York City, June 18, 1852, of Celtic Irish, Lowland Scotch, and Northumbrian English descent. He was educated in

the public schools of New York, and received an academic education in the College of the City of New York. He graduated June 18, 1874, from the medical department of the University of New York. He practiced on Ward's Island, New York, from 1874 to 1878; in New York City from 1878 to 1881; in Cook county (Chicago), Ill., from 1881 to the present time. He has been Assistant Physician to the Ward's Island Insane Hospital and Superintendent of the Cook County Insane Hospital. His practice is limited to nervous and mental disease. He has conducted original researches and published valuable papers on the following subjects in the *American Journal of Insanity*, *Alienist and Neurologist*, *American Lancet*, *St. Louis Clinical Record*, and other leading medical journals of this country: "Katafonia," 1877; "Trophic Disturbances of the Insane," 1878; "Syphilis in Relation to Insanity," "Transitory Mania," "Paranoia," 1880; "Rheumatism and Insanity," "Lead-Poisoning and Insanity," 1881; "Simulation of Insanity by the Insane," "Scarlatina and Insanity," 1882; "Paretic Dementia," "Measles and Insanity," 1883; "Moral Insanity," "Epileptic Insanity," "Gynecology and Insanity," 1884; "Conium in Insanity," "Race and Insanity," 1886; "Genius and Insanity," 1887; "Cardiac Disease and Insanity," "Phthisis and Insanity," 1890; "Gout and Insanity," 1891; "Variola and Insanity," "Evolution of the Sexual Appetite," and "Art in the Insane," also "Congenital Opium Habit," 1892. He has been editorially connected with *Gaillard's Medical Journal*, the *Chicago Medical Review*, the *Journal of Nervous and Mental Disease*, the *Journal of Neurology and Psychiatry*, and has been editor of the *Medical Standard* since its foundation.

KIMBALL, Gilman, of Lowell, Mass., was born at Hill (formerly New Chester), N. H., December 8, 1804, and died at his home in July, 1891. He was the oldest and most noted physician in the city of Lowell, having lived and practiced his profession there for over sixty years. He was educated at a private school, and graduated from the Medical School of Dartmouth College, in 1827. He began to practice in Chicopee, Mass., but removed to Lowell in 1830. Previous to his removal he visited Europe, and spent his time chiefly in Paris, attending the surgical clinics of Dupuytren, at Hotel Dieu, and of Boyer, at La Charité. During the sixty years of his practice he has performed all the operations naturally occurring in the line of surgery. As among the notable of these may be mentioned two of amputation at hip-joint, one of which was successful; ligation of the internal iliac artery, fatal the nineteenth day after secondary hemorrhage; of the external iliac, carotid and subclavian, all successful; he has performed 225 operations for ovariectomy, with sixty-nine per cent. of recoveries; extirpated the uterus in twelve cases, with five recoveries. He received honorary degree of M. D. from Williams College in 1837, and from Yale College in 1856; also honorary degree of A. M. from Dartmouth College in 1839. In 1832 he was elected a member of the Massachusetts Medical Society, and in 1877 member of the American Gynecological Society, and vice-president of the Massachusetts Medical Society. Of his contributions to medical literature the most important relate to gastrotomy, ovariectomy,

and uterine extirpation; cases illustrating certain points of practice in the first, and tending to release the operation from some of its most serious dangers; a case relating to the last-mentioned operation is notable as being, according to Koeberlé, of Strasbourg, the first on record where the operation was successfully performed upon a correctly established diagnosis; paper on the "Treatment of Uterine Fibroids by Electrolysis or Galvanism, and a paper on the "Extirpation of the Uterus," read before the American Medical Association in Chicago, June, 1877. In 1844 he was elected Professor of Surgery in the Vermont Medical College, Woodstock, and in 1845 in Berkshire Medical College, Pittsfield, Mass. He subsequently resigned these professorships to take charge of the Lowell Hospital, an institution established by the proprietors of the various manufacturing corporations of Lowell for the benefit of their operatives. He served for four months under Gen. B. F. Butler, as brigade surgeon, at Annapolis and Fortress Monroe, at both places superintending the organization of the first military hospitals established for the benefit of the sick and wounded in the War of the Rebellion. It may be said of Dr. Kimball that he gained a world-wide reputation as a leader and discoverer in his special line of surgery; and that few men have retained their physical and mental vigor to such a remarkable degree. He continued practice up to a time far beyond that at which most men retire, and only then when forced to do so by the failing of his physical powers. He was devoted to his profession, and pursued the most delicate and difficult branches of it with a zeal and courage that have resulted in much permanent good for suffering humanity and his name will occupy a high niche in the temple of fame.

KINGSLEY, Byron Fillmore, of San Antonio, Texas, was born in Ripley, New York, July 11, 1852, of English and German descent. He was educated in the public schools of his native place, and at Coldwater, Michigan, where he studied medicine under the late Dr. C. S. Tucker. In 1871-72 he took the regular course in pharmacy at the University of Michigan. Here he also attended his first and second courses of lectures in medicine. He graduated at the Detroit Medical College in 1874 and later in the same year at the Long Island College Hospital. He then located in St. Louis, Mo., where he remained only a year when he removed to Carrollton, Ill.; here he soon became secretary of the Green County Medical Association and county physician. Desirous of a wider field, and being possessed of a somewhat adventurous spirit at that time, he removed to San Antonio, Texas, early in 1877, arriving on the first through passenger train to the latter place. In June, 1879, he was made an Acting Assistant Surgeon United States Army, by Surgeon-General Moore (retired) then medical director department of Texas. For the next four years he was stationed at different posts in Texas, Colorado, and the Indian Territory, returning to San Antonio in 1883. In 1885 was elected vice-president of the Western Texas Medical Association; in 1888 vice-president Texas State Medical Association; in 1891 president Western Texas Medical Association; in 1892 was appointed United States Pension Examiner. He is a member of the American Medical

Association and American Public Health Association. He has devoted special attention to diseases of chest, but in later years his practice has developed largely into surgical and gynecological. He has a private sanitarium in conjunction with his sister, Dr. Josephine Kingsley, for the accommodation of the latter class of patients. He was married to Miss Nellie A. Glennon, of Chicago, April 26, 1892.

Dr. J. Kingsley.

KINLOCK, Robert Alexander. of Charleston, S. C., was born in that city, February 20, 1826, and died there December 23, 1891. He was graduated at the College of Charleston in 1845. He was Professor of Surgery as well as dean of the faculty, in the South Carolina Medical College, and ex-president of the Medical Society of South Carolina, and was formerly vice-president of the American Medical Association and first surgeon to the Roper Hospital, on Queen street. He was a visitor to the Berlin Medical Conference, in 1890. He was at one time editor of the *Charleston Medical Journal*. During the war he served the Confederate forces as medical examiner, inspector of hospitals, and medical director of the Southeastern Department. He was a contributor to the local periodicals, and to the *American Journal of Medical Sciences*, chiefly on surgical and epidemiological subjects. He was an associate member of the Philadelphia College of Physicians. It is said that he made the first resection of the knee-joint, for chronic disease in the United States, and the first to treat fractures of the lower jaw and other bones by wiring the fragments. He was also

credited with being the first surgeon that ever performed laparotomy for gunshot wound of the abdomen without a protrusion of the viscera. He invented an improved urethrotome and stricture dilator, also an intra-uterine stem pessary. By birth, Dr. Kinlock inherited both Scottish and Welsh traits; by education he was cosmopolitan, having, besides his training at home, and at the University of Pennsylvania, a considerable term of study in the hospitals of London, Edinburgh, and Paris; by his personal character and the fine temper of his intellect, he was worthy to be filed in the Bramin class, as it has been outlined by Dr. Holmes.

KINNEY, Augustus C., of Astoria, Ore., was born in Muscatine, Iowa, July 26, 1845. He is a son of Robert C. Kinney, of Oregon, formerly of St. Clair county, Ill. He was graduated at Bellevue Hospital Medical College in New York City in 1870, and served as interne on the staff at the Charity Hospital for eighteen months. He practiced his profession at Portland, several years thereafter at Astoria, in his adopted State. He has paid particular attention to diseases of the lungs, and in the treatment of tuberculosis has originated an unusually successful treatment. He has served four years as State Health Officer, and is regarded as one of the leading physicians of Oregon.

KIRKBRIDE, Thomas S., of Philadelphia, Pa., was born near Morrisville, Bucks county, Pa., July 31, 1809, and died in the former city December 16, 1883. His ancestor, Joseph Kirkbride, came to this country from the parish of Kirkbride, county of Cumberland, England, with William Penn, being connected with the Society of Friends, as have been his descendants down to the present generation. He received his academical education at Trenton, N. J., and graduated from the medical department of the University of Pennsylvania in March, 1832. In the following April he was appointed Resident Physician to the Friends' Asylum for the Insane, in which position he served for one year, when, in March, 1833, he was elected Resident Physician to the Pennsylvania Hospital, where he remained two years, after which he engaged in private practice, settling in Philadelphia and pursuing his practice till December, 1840. In October of the latter year he was elected, without solicitation on his part, Physician-in-Chief and Superintendent of the Pennsylvania Hospital for the Insane, a new institution, then nearly completed, and to which it was proposed to remove the insane from the old hospital at Eighth and Pine streets. The new hospital was opened on the first day of January, 1841, since which time he had the care and management of it until his death, the inmates having increased meanwhile. In 1854, the original building having become crowded, he recommended the erection of a new one on the grounds of the institution, and a complete separation of the sexes. He further recommended that the building proposed should be erected through an appeal to the public, which accordingly was made and with entire success, the building being completed wholly from private contributions, exceeding in the aggregate \$355,000. The new building was opened in 1859, and since that time the Pennsylvania Hospital for the Insane has consisted of two separate departments—one for men and one

for women—each having a capacity for 250 patients, and entirely distinct from each other in all their arrangements, though with the same physician-in-chief and the same board of managers. The success of this experiment has been complete, and has led to the adoption of the plan in other institutions. He was a member of the Association of Medical Superintendents of American Institutions for the Insane, of which he was one of the originators, and for eight years the president; the Philadelphia Medical Society, and the American Philological Society; a Fellow of the College of Physicians of Philadelphia, and honorary member of the British Psychological Association, not to mention others at home and abroad. He has written a work on "The Construction, Organization and General Arrangements of Hospitals for the Insane," 1856, and one on "Rules for the Government of those Employed in the Care of the Insane," "An Appeal for the Insane," 1854; besides thirty six "Annual Reports" from the hospital, which are regarded as very valuable, and in which most subjects connected with the care of the insane are discussed. He has also contributed various articles and reviews to the *American Journal of the Medical Sciences*, the *American Journal of Insanity*, and other periodicals. While in private practice he was physician to numerous charitable institutions, including the House of Refuge, the Magdalen Asylum, and the Institution for the Blind, of which latter he was a manager from near the time of its first foundation. His son, Dr. Joseph I. Kirkbride, who survives him, is a prominent physician of Philadelphia.

KITCHEN, John M., of Indianapolis, Ind., was born in Piqua, Miami county, Ohio, July 12, 1826. He resolved early in life to study medicine, and after suitable instruction in the office of a local practitioner of good standing, attended lectures in the Jefferson Medical College of Philadelphia, and the University Medical College, New York City, graduating in the latter institution in March, 1846. Commencing practice in Fort Wayne, Ind., he remained there until 1849, when he went to California as second doctor on an emigrant ship. Upon arriving, after a seven months' voyage around Cape Horn, at San Francisco, he immediately entered into practice, continuing until March, 1850, when he went on foot to the mining regions near the head waters of the Yuba river, and established a small hospital for miners; in this hospital he performed the duties of cook, nurse and physician. This experience afforded many valuable lessons in practical medicine, for the difficulty in procuring medical supplies frequently made it necessary to rely more on nature than art in the management of disease and the results often being unexpectedly favorable served to make a lasting impression. Finally, in 1851, Indianapolis was selected for a permanent location. In 1853 he was married to Mary F., daughter of John H. Bradley, Esq., of that city. For more than thirty years he has endeavored conscientiously to perform the duties required of a general practitioner of medicine and surgery, but not having a taste for writing, has only occasionally contributed brief articles for medical journals. He is a member of the Marion County Medical Society; of the Indiana State Medical Society, and of the American Medical Association, and has also

at different times held the following positions: president of the board of trustees of the City Hospital; trustee of the Indiana Institution for the Deaf and Dumb; physician to the State Institution for the Blind; consulting physician to the City Hospital; consulting physician to the State Institution for the Deaf and Dumb; surgeon in charge of United States Army General Hospital, at Indianapolis, from 1861 to 1865; president of the Board of United States Examining Surgeons for Pensions, from 1886 to 1893; and is now, and has been for many years, medical examiner for many of the leading life insurance companies of this country. Having acquired a fortune by his professional skill, industry, and good business management, he has retired from general practice and confined himself of late years to office and consultation business and the enjoyment of that recreation and repose which his long and faithful devotion to his profession so justly entitles him.

KNIGHT, Frederick Irving, of Boston, Mass., was born in Newburyport, Mass., May 18, 1841. He graduated from Yale, in the class of 1862, and then began the study of medicine, which he continued until the spring of 1867, first at the United States Hospital, New Haven, then in the Harvard Medical School, where he received the degree of M. D., in 1866, and finally in New York City. For a year from April, 1865, he held the position of senior house physician at the Boston City Hospital. In the spring of 1867, he left New York to become associated in practice with Dr. Henry I. Bowditch, of Boston, with whom he was in partnership until 1879. Meanwhile he held appointments in the Boston Dispensary, in the Carney Hospital, and in the City Hospital. These he relinquished in the summer of 1872, to establish a special clinique of laryngology at the Massachusetts General Hospital. In 1871-72, Dr. Knight spent a year in Europe, studying in Vienna and Berlin. In May, 1872, he received the appointment of instructor in auscultation, percussion and laryngoscopy in Harvard University. He has always devoted considerable time to the medical school there, and in 1882 was appointed Assistant Professor of Laryngology, and in 1888 Clinical Professor. From 1880 till 1883, he was associate editor of *Archives of Laryngology*, published by G. P. Putnam's Sons, New York. Dr. Knight is a Fellow of the American Academy of Arts and Sciences; was president of the American Laryngological Association in 1882, and was president of the American Climatological Association, 1891; a national organization founded in 1883 for the study of climatology, hydrology, and diseases of respiratory and circulatory organs. He is also a member of the Boston Society for Medical Observation, and was president of the Boston Society for Medical Improvement, from 1891 till 1893. He is consulting physician to the Massachusetts General Hospital, and has been a frequent contributor to medical journals of articles upon affections of the throat and chest, and upon climatology. Dr. Knight was married in Berlin, in 1872, to Louisa Armistead Appleton, formerly of Baltimore. A daughter (Theodora Irving) is their only child.

KNIGHT, James, of New York, was born at Taney Town, Frederick county, Md., February 14, 1810, and died in the former city October 24, 1887. He was the son of Samuel Knight,

a manufacturer of military arms, and employed by the United States government, who died at Richmond, Va., in 1809. His grand parents came from England in 1766. He was educated in the village school, and at St. Mary's College, South Mountain, Md., and graduated from the Washington Medical College, Baltimore, in March, 1832, having spent seven years in the Baltimore General Dispensary. Practicing in Baltimore for one year, and in Cincinnati, Ohio, for about nine months, he afterwards traveled in various parts of the United States for the improvement of his health, and finally settled in the city of New York, in December, 1835. He continued as a regular family practitioner till 1840, from which time, by the advice of his friend, Prof. Valentine Mott, he devoted special attention to orthopedic surgery, a branch of the profession to which he had given much study when in the Baltimore General Dispensary. In 1842, and up to 1844, he assisted in the orthopedic treatment of patients attending the public clinics in the medical department of the University of New York. His experience at those clinics impressed him so deeply with the necessity for a charitable institution to supply the wants of indigent patients that he made a strenuous, and eventually successful, effort to organize such an institution, the organization being consummated on April 13, 1863, and known as the New York Society for the Relief of the Ruptured and Crippled, he surrendering his private dwelling for a hospital. In 1870, however, the society completed a most capacious hospital of its own, and he was appointed physician in charge, and in which many thousand patients have been treated annually, almost all of them being supplied with surgical appliances free of expense. He was a member of the Medico-Chirurgical Society of Maryland; the District Medical Society of Ohio; the County Medical Society of the City of New York; the Medical Journal Association of the City of New York; and Resident Fellow of the New York Academy of Medicine; a life-member of the New York Society for the Relief of Widows and Orphans of Medical Men, and also of the American Institute; an honorary member of the New York Horticultural Society; and a fellow of the Academy of Design. He published a work on "The Improvement of the Health of Children and Adults by Natural Means," 1868; and one entitled "Orthopedia; or, a Practical Treatise on the Aberrations of the Human Form," 1874; and "Static Electricity as a Therapeutic Agent," 1882.

KOLLOCK, Charles Wilson, of Charleston, S. C., was born in that State, April 29, 1857. His father is Cornelius Kollock, M. D., who is a native of South Carolina, and his mother, Mary Henrietta, second daughter of the late Charles B. Shaw, of Boston, Mass. He attended private schools in Cheraw until sixteen years of age, when he entered the Virginia Military Institute, at Lexington, Va., and was graduated in the class of 1877. After reading medicine for a year in the office of his father, he matriculated in the medical department of the University of Pennsylvania, from which he was graduated in March, 1881. In September, 1881, he was appointed one of the Resident Physicians in the Philadelphia (Blockley) Hospital, and served for one year in this institution. He next served six months in the

same capacity in the Children's Hospital, and for one year as Resident Surgeon in the Wills Eye Hospital, of Philadelphia. Dr. Kollock spent some time in Europe, and attended the eye clinics in London and Paris. In June, 1885, he settled permanently in Charleston, and has since confined his practice strictly to diseases of the eye and ear. He is a member of the American Medical Association, of the American Ophthalmological Society, the South Carolina Medical Association, and one of the honorary chairmen of the Ophthalmological Section of the Pan-American Medical Congress for 1893. Dr. Kollock is Ophthalmic Surgeon to the Charleston City Hospital and Shirras Dispensary. Of late he has been giving considerable attention to the peculiarities and diseases of the eye of the negro.

J. Kornitzer

KORNITZER, Joseph, of Socorro, New Mexico, was born in Vagh-Ujhely, Hungary, where his father, Philip, an immigrant from Moravia, held the position of council clerk. After a six-years' gymnasial course at Trencheny and Buda-Pesth, Hungary, and a two-years' course of philosophy at the University of Vienna, Austria, he entered upon his medical studies in the "Josephinum," an institution for the education of army surgeons, in Vienna. At the outbreak of the Hungarian Revolution, in 1848, he shouldered the rifle, to serve as a private in the Hungarian army. After its surrender (Vilagos, August 13, 1849) to the Russian auxiliaries, sent to the rescue of Austria's throne, he fled, first home to see his old father, and then to different places in Hungary, where, unknown and unmolested, he for several years was teaching school and applying

himself hard to the studies of anatomy, and physiology, until a general amnesty, granted to the rebels by the Emperor Francis Joseph, made it possible for him to resume his medical studies at the University of Vienna, from where he also graduated in 1866. In July of the same year, during the Austro-Prussian War, he was commissioned surgeon-in-chief to a ward of a hospital established at Klosterneuburg, near Vienna, for the reception of the wounded in battle. Soon, however, a raging cholera epidemic prevailing in Moravia, then densely occupied by the Prussian army, induced him to go there in order to try (*i. e.*, to originate) the then novel hypodermic treatment in this disease. A detailed description of this fact he recently contributed to *Merck's Bulletin* (October, 1892). In 1868 he came to this country and opened practice in New York City. Anxious to acquire a home of his own, he removed (1873) to Topeka, Kan. During his stay there, in February, 1880, he went to Cincinnati, O., where he intended to publish a work on the pathology and abortive treatment of the zymotic and inflammatory diseases. A lecture on this object, delivered before the Academy of Medicine of that city, and subsequently published in a pamphlet, was received with applause and favorably commented upon. A few articles, soon to appear in *Merck's Bulletin*, on the same object will lay before the profession some really original therapeutical ideas, which, if widely adopted, are destined to divest the eruptive diseases (scarlet fever, variola, diphtheria, erysipelas, etc.) of the largest part of their horrors. When in full train, writing up his intended work, he was called away from Cincinnati to the bedside of his wife, whose health, for quite a while, had been failing. For this reason, too, in February, 1882, he removed to Socorro, New Mexico, his present abode, which is one of remarkable climatic salubrity. For the last twelve years he made tuberculosis his special study. The result thereof he has recently contributed in concise articles to the periodical above mentioned, which are sure to prove a highly valuable contribution to our noble art and should command the general attention of the profession. Whatever Dr. Kornitzer wrote, makes the impression of *science applied*. *Non multa, sed multum*.

KUHN, Adam, of Philadelphia, Pa., was born in Germantown, Pa., November 28, 1741, and died July 5, 1817. His father was a native of Swabia, a physician by profession, and a man of bright parts and liberal education. Having removed to Lancaster, in Pennsylvania, where he became a magistrate, "he was deeply interested in the promotion of classical learning amongst the youth of that place, and for this end procured the erection of a school-house, in which the Greek and Latin languages were taught by the best qualified masters." Under such auspices Dr. Kuhn received his elementary education, and commenced his medical studies with the advantage of parental direction. In 1761, Dr. Kuhn went to Europe, and, deviating thus far from the course pursued by his colleagues, resorted to Sweden for instruction in botany and materia medica, at the hands of Linneus, then at the height of his renown. He subsequently went to Edinburgh, and received the degree of Doctor of Medicine from that university, in 1767. The thesis, published by him on that occasion, "*De Lava-*

tione Frigida," was dedicated to his friend and instructor, Linneus. The letters of that eminent naturalist to the father of Dr. Kuhn, evince the deep interest he took in the son, and the particular estimation he had conceived of his abilities. On his return from Europe he settled in Philadelphia and practiced medicine. In January, 1768, he was appointed the Professor of Materia Medica and Botany in the College of Philadelphia, and in November, 1789, he became the Professor of the Theory and Practice of Medicine in the University of Pennsylvania. He also held the chair of the Practice of Medicine, from the date of the union of the college and the university, in January, 1792, till 1797. He was a physician of the Pennsylvania Hospital from May, 1775, till January, 1798, and was president of the College of Physicians from July, 1808, until his death.

LACKERSTEEN, Mark Henry, of Chicago, Ill., was born in London in 1835. His early education was conducted chiefly in St. Andrews, Scotland, where he received the elements of a sound classical training, and the foundation of a thorough knowledge in the physical sciences under the teaching of Sir David Brewster. After a short stay at King's College, London, and a course in the Royal School of Mines, he entered the University of Cambridge and graduated in 1854. In the same year he commenced his medical studies in King's College and University College, London, and obtained honors in chemistry, physiology, zoology and medicine. He passed the examination of membership of the Royal College of Surgeons in 1857, and graduated M. D. in St. Andrew's University in 1858. Through the recommendation of Faraday he was elected to a life fellowship of the Chemical Society, and Bentley and Rhymer Jones proposed and seconded his election to a life fellowship of the Linnean Society. He then visited the schools in Paris, Berlin and Vienna, in order to study the methods then in vogue on the continent, and on his return to England successfully competed for an assistant surgeoncy in the Bengal Army Medical Department for service during the mutiny. He served in Lucknow to the end of 1859, and on the establishment of peace was placed in charge of a hospital for diseases of women and children, and in 1861 was appointed Superintendent of the Central Asylum and Hospital for Nervous Diseases in the Punjaub. In 1865 Dr. Lackersteens was selected by the imperial government for special duty in connection with the sanitation of the province, under the administration of Lord Lawrence. Dr. Lackersteens received the special thanks of the government for his official reports of three epidemics of Asiatic cholera; for reports on the etiology and treatment of the Delhi sore or Aleppo boil; for a series of chemical analyses of the potable well waters of the north western provinces; for the report on the causes and prevention of the immense mortality among the prisoners in the jails of Punjaub; for a report on the Indian methods of treating the bites of rabid animals; for a summary of Hindoo medicine, with an account of the indigenous materia medica; for statistical and tabulated reports of the outbreak of fever and cholera in relation to meteorological conditions, and produced by unwholesome and improperly prepared food and impure drinking water; and for the treatment of insolation and

heat apoplexy. Dr. Lackersteen obtained high proficiency certificates from the Fort William College in Calcutta for successfully passing examinations in the Sanscrit, Persian, Hindostani and Bengali languages. Close application to his duties in a very trying climate gradually broke down the Doctor's health, and he was obliged to return to England on sick leave in 1867. His services seem to have been well appreciated by the government, for during his prolonged absence from duty, extending over a period of five years, he was allowed the full pay and allowances of his special appointment in India. During his medical furlough he took special courses in the Royal School of Mines in chemistry under Frankland, and in biology under Huxley, and passed his examination for membership of the Royal College of Physicians of London, which made him eligible to hospital and college appointments and to consulting practice in London. He was soon elected attending physician to St. George's and St. James' Infirmary, and in 1875 he retired from the army medical service with the rank of surgeon major. In 1877 Dr. Lackersteen married Edith Trimmer, the only daughter of Captain J. Trimmer, of the British Army, and a cousin of Ed Trimmer, the secretary to the Royal College of Surgeons of England, and took up a chamber and consulting practice in London. In 1880, by representations made to him he was induced to sail for America, a step he has never regretted. The scientific work he was supposed to undertake proving a myth, he settled down to professional practice in Chicago, where he has established a respectable office and consulting business. He was one of the founders of the Polyclinic, and subsequently of the Post Graduate School of that city in which he holds the chair of general and clinical medicine.

LAGORIO, Antonio, of Chicago, Ill., was born in that city, March 6, 1857. At the age of six years he was taken by his parents to Italy for an education, and was placed in school at Chiavari, province of Genoa, when, having completed his studies in the gymnasium, and mastered the modern languages, he returned to Chicago, and immediately entered Rush College, graduating with honor from this institution in the spring of 1879. Desirous of acquiring a deeper knowledge of bacteriology, pathology, and particularly nervous diseases, he again returned to Europe, in 1884. The cliniques of Paris, Rome, Genoa, and Pavia were all visited in turn for a period of nearly five years. It was during this time that L. Pasteur had made known his discovery on the preventive treatment of hydrophobia, and this meeting with his views, and being directly in line with his studies, Dr. Lagorio decided at once to devote his attention to it. To this end he was admitted, and attended for several months the Pasteur Institute at Milan, and mastered all the delicate maneuvers required in the preparation, propagation, and attenuation of the rabic virus to be applied to the treatment of man. At the termination of these important studies he returned to Chicago and founded the Chicago Pasteur Institute, the only one in the West, and which has achieved marvelous results. At this time of writing, nearly three hundred cases have been treated without a single failure. During the past two years Dr. Lagorio has devoted considerable time to the study of epilepsy, and has applied recently

a modified form of Pasteur inoculations for its treatment, with encouraging results. While abroad Dr. Lagorio took part in the meeting of the Italian Medical Association, held at Pavia, in 1887. He was also special correspondent of the *Chicago Medical Journal and Examiner*. His correspondences were many, highly scientific, and read with interest. He

A. Lagorio

is a member of the Chicago Medical Society; Fellow of the Academy of Medicine, and other scientific societies; and lecturer on hydrophobia and the Pasteur system, in Rush Medical College. He is married, and the happy father of three children, to whom he is affectionately attached.

LAIDLEY, Leonidas H., of St. Louis, Mo., was born September 20, 1844, in Carmichaels, Pa., a village situated in the beautiful valley of the Monongahela river. His father, Dr. Thomas H. Laidley, a medical gentleman in his days known as an able physician and respected as a worthy citizen, reared twelve children, the subject of this sketch being the tenth child. His mother was Sarah Barclay, daughter of the honorable Hugh Barclay, of Pennsylvania, a well known gentleman in the halls of the legislature of that State. Reared in a medical atmosphere he was early taught to revere the medical men of that day which gave him a desire to enter the profession honored by his father and so kindly regarded by him. As early as at the age of ten years he was placed in the flourishing institution, Greene Academy, located at his native place. His education was directed with a view to entering the medical profession. He continued in school, spending his leisure moments in his father's office, until the year 1866, when he en-

tered the Cleveland Medical College. The following year he entered the Jefferson Medical College at Philadelphia, Pa., attending the hospitals of that medical center and enjoying the teaching of the most noted medical faculty of that day, including Professors Dunglison, Gross and Pancost, who have made a brilliant history for medicine in America. Graduating from that institution in the spring of 1868, he entered into active practice with his father and brother (Dr. Jno. B. Laidley). Owing to the limited field for study in that community, he went to New York, where he entered Bellevue Hospital Medical College; there he took a higher and more thorough course, and graduated with distinguished honors in that institution in 1872. He immediately returned home, and not finding a sufficiently large field for a successful and extensive practice, made known his intentions to locate in the city of St. Louis, where he established himself in the spring of 1872. Unaided, in a strange city, but with an honest purpose in view he began his career in the practice of medicine, meeting with the usual success and that just reward which is assured to those who will pay the price—"labor"—actuated by right principles. In 1880 he married Miss Elizabeth Latta, daughter of William Latta, Esq., of Lancaster, O. Two bright children are the result of this union. Early in his career he showed a decided love for the humanitarian side of his profession, organizing, in company with a few others, the "Young Men's Christian Association" in St. Louis, giving especial attention to the sick applying for aid to that institution. His work grew in such proportions that a free dispensary was organized, which was the nucleus of the Protestant Hospital Association, giving to that city one of the most prominent institutions of its kind. As a teacher of medicine, he was early called to fill the Chair of Anatomy and Chemistry in the Western Dental College, of his adopted city. He continued in that position until two years later, when, on the organization of the College of Physicians and Surgeons of St. Louis, he was called to the Chair of Surgical Diseases of Women. After five years of successful work he resigned, with eight of his colleagues. Having attained reputation as a teacher, he was, on the organization of the Beaumont Hospital Medical College, again called to the chair of Surgical Diseases of Women in that institution, which position he still holds. Dr. Laidley is also surgeon to the Protestant Hospital, and consultant to the Female Hospital of St. Louis. As a writer, he has confined his work to the reports of his cases, which have been large in number, especially in the field of surgery, to which branch the doctor has given his untiring attention. He has been identified with the profession as a member of the American Medical Association, medical societies of Pennsylvania and Missouri, and the St. Louis Medical Society, in which he has held offices at various times. In 1883, he went as a delegate to the British Medical Association, held at Liverpool. During the same year he also visited the hospitals at Edinburgh, London, and Paris.

LANGDON, Frank Warren, of Cincinnati, O., was born in that city December 16, 1851. He is descended from one of the pioneer families of America, the earliest representatives of which, Philip Langdon and two brothers, hav-

ing landed at Boston from Yorkshire, England, in 1640. Three generations of the family were soldiers in the Revolution, namely: Philip's son, Paul, his grandson, John, and great-grandson, John W. His paternal grandfather, Elam P. Langdon, settled in Cincinnati in 1806, and was one of the leading citizens of the future great city. His paternal grandmother was Ann Cromwell, daughter of a New York ship-builder, a direct descendant of Oliver Cromwell, the Protector. His maternal grandfather, B. P. Aydelotte, M. D., D. D., was of Swedish descent, and one of the prominent educators and divines of Cincinnati in early days. Dr. Langdon was educated at the Cincinnati public schools and by private tutor, and pursued the study of medicine under the late Dr. Wm. Clendenin, of Cincinnati, graduating in 1881 at the Miami Medical College. After a year's service at the Cincinnati Hospital as Resident Physician, he located in Cincinnati for practice, and was at once offered the position of Assistant Demonstrator of Anatomy at his *Alma Mater*. He has successively occupied the positions of Demonstrator of Anatomy, Professor of Descriptive and Surgical Anatomy, and of Clinical Medicine, and at present occupies the Chair of Surgical Anatomy in the same institution. He has also been Curator and Microscopist to the Cincinnati Hospital, Acting Pathologist to the same, 1882, and Physician and Surgeon to the Home for Incurables, 1891-92. He has been a contributor to current zoological literature, especially in the departments of anthropology and ornithology, and, in recognition of work in these branches of science, was elected, in 1882, a Fellow of the American Association for the Advancement of Science; also to membership in the American Ornithologists' Union, the Boston Zoological Society, the Linnean Society of New York, the Association of American Anatomists and the Cincinnati Society of Natural History. In 1891 he was elected president of the Cincinnati Medical Society, and is also a member of the Academy of Medicine of Cincinnati, the Walnut Hills Medical Society and the Society of Ex-Internes of the Cincinnati Hospital. In 1892 he visited the medical schools and hospitals of London, Glasgow, Hamburg, Berlin, Munich, Vienna and Paris, devoting his time chiefly to surgical studies. Dr. Langdon has been a contributor to current medical literature, among his more important writings being that on "The Surgical Anatomy of the Brain," wherein an original system of localizing brain areas by external guides is presented as simpler and more exact than the methods heretofore in use. (See *Cincinnati Medical Journal*, April, 1891.) He was also the first to advocate the treatment of intestinal (fecal) obstruction with large doses (three to four ounces), frequently repeated, of warm olive oil, which method has found much favor with the profession. He also devised (in 1890) a special colon tube, adapted to irrigation of the entire colon for various purposes, which has been appreciated and is in extensive use by the profession. (See *Cincinnati Lancet-Clinic*, April 4 and 11, 1891.) In 1891 (*New York Medical Record*, August 15) he revived the view (rejected by most modern anatomists) that the arachnoid of the brain was a double sac, and demonstrated the same by dissections and diagrams; also pointing out the existence

of two undescribed foramina by which the arachnoid cavity communicated with the sub-arachnoid space. A paper on the use of "Benzine as a Parasiticide" and cleanser of surgical areas and instruments has also attracted favorable comment, *Cincinnati Lancet-Clinic*, 1891.

John A. Larrabee

LARRABEE, John Albert, of Louisville, Ky., was born at Little Falls, Gorham, Maine, May 17, 1840. He is a descendant of an old and distinguished French family. The Larrabees trace their advent into this country to the revocation of the edict of Nantes, in the year 1685, when four hundred thousand Protestants, called Huguenots, quitted France and sought homes in other countries, and is a son of John Rogers Larrabee, who was a prominent manufacturer of cotton fabrics, and a descendant of John Rogers, the martyr. He received his academic education at Gorham, Bethel Hill and Brunswick academies. He graduated with honor at the Maine Medical School of Bowdoin College in 1864. In the late Civil War he served first as medical cadet, entering the United States Army by examination, and reported for duty under orders of the Secretary of War at Louisville, Ky.; afterwards as acting assistant surgeon, serving on land and sea in the department of Virginia, at Fortress Monroe and at Louisville, Ky. While still in the United States service he was married, March 30, 1865, to Miss Hattie Bulkley, a daughter of William H. Bulkley, of Louisville. The Bulkley family traces its origin back to William the Conqueror, 1066. The Larrabee and Bulkley arms adorn Dr. Larrabee's residence in the Highlands. On retiring from the army Dr. Larrabee located in Louisville, and soon became an earnest worker in medical societies. He was one of the founders of the Medico-Chirurgical Society, of which he has been both a secretary and presi-

dent. He was for several years secretary of the Kentucky State Medical Society; a member of the International Congress meeting at Philadelphia in 1876; also a member of the Ninth Congress of 1887. He was in attendance as delegate to the meeting of the International Medical Congress, Berlin, 1890. As a medical writer he has contributed largely to the medical journals of the day. Conspicuous among his contributions are: "Summer Complaints of Children;" "Epidemic Cerebrospinal Meningitis;" "Ricketts;" "Scarlet Fever;" "Chorea Rheumatism" and "Infantile Therapeutics." His specialty is children's diseases. He was elected to the chair of Materia Medica and Therapeutics and Clinical Lecturer on Diseases of Children in the Hospital College of Medicine in 1874. He has filled the chair of practice and is at this time Professor of Obstetrics and Diseases of Children in that institution. He has been appointed honorary chairman of the section on therapeutics in the Pan-American Congress, Washington, D. C., September, 1893.

LEALE, Charles Augustus, of New York, was born in that city, March 26, 1842. He is the son of Captain William Pickett Leale and Anna Maria (Burr) Leale, both of English ancestry. His father, a courageous and noble man, was drowned at the age of twenty-three, leaving his young mother a widow eighteen years of age, with this only surviving child. His mother was a handsome, highly educated lady, who taught her son his first lessons in the classics and botany. His grandfather was an accomplished gentleman of means, and was among the few in the United States to attain to the thirty-third degree in Free Masonry. He was noted for his liberality, and during the great famine in Ireland shipped a cargo of cereals at his own expense to that country. Dr. Leale, after careful preparation, at fourteen years of age, began the study of anatomy, physiology, materia medica and chemistry, and at eighteen years he matriculated as a medical student, and after receiving a practical analytical and university course, became a private pupil of Professor Frank H. Hamilton, at the Bellevue Hospital Medical College, and daily attended the large surgical clinics in New York City. Subsequently, after an examination before the United States Army Medical Board in New York City, he was selected and appointed Medical Cadet, United States Army. In September, 1864, "for zeal, intelligence, professional devotion and success," the surgeon-general transferred him to New York, where he received special instruction in diseases of the heart and lungs, from Dr. Austin Flint, Sr., and in gunshot wounds and surgery, from Dr. Frank H. Hamilton. In February, 1865, he received the degree of M. D. from Bellevue Hospital Medical College, and was immediately invited to appear before the Army Medical Board of Examiners, at Washington, D. C., where, after a competitive test of seven days, he was chosen and commissioned by the President, and confirmed by the Senate, Assistant-Surgeon United States Volunteers, and at once assigned to duty at United States Army General Hospital, Armory Square, Washington, D. C., where he had a practical experience among a large number of severely wounded soldiers, and performed many important surgical operations. He had not been on duty a month before he was made

executive officer of that large and important army hospital, a position he retained until its final closure at the end of the war. He was then twenty-three years of age. Thus, as events proved, Dr. Leale, from early youth, had been prepared for the skillful, efficient, courageous and important part in which he was soon destined to be a participant, whereby a President's death was for hours averted, and the country given time during the following day of suspense to preserve its continuity at the most critical period of its existence, enabling President Lincoln's son to see his father alive, and the Cabinet to assemble for deliberate counsel. When President Lincoln was assassinated, April 14, 1865, Dr. Leale was the first surgeon to reach him, and, at the request of Mrs. Lincoln, took charge of the President. He found him crouched down in a sitting pos-

Charles A. Leale.

ture, with his head held up in a large arm chair. He was in profound collapse and pulseless at the wrist, and apparently dead. Dr. Leale immediately stretched him out upon the floor, which relieved the heart failure and caused pulsation to be resumed. He then made a careful examination, and discovered and stated while in the theater that recovery, even to consciousness, was impossible, and the wound through the brain was positively fatal. The doctor removed the coagula from the opening to the brain, and thereby relieved brain pressure and paralysis. It was the diagnosis and prognosis of Dr. Leale that was first telegraphed over the world informing it of the sad event. Without an instant's delay Dr. Leale resorted to forced respiration, and prevented two modes of death that appeared to be immediately inevitable, viz: Death from asthenia, or death by apnoea. Through Dr. Leale's prompt efforts, the life of the President was undoubtedly prolonged for over nine hours, as nothing more than what he had directed was

done until death. At Dr. Leale's suggestion, and under his directions, the dying President was removed to the nearest available house, where he then placed him in the position and upon the bed on which he died, again and again removed the coagula from the opening to the brain, wrapped him in warm blankets, and applied sinapisms and artificial heat. After Dr. Leale had done all that was imperatively needed, he sent for the Surgeon-General and the President's family physician and his clergyman. Dr. Leale remained at his bedside until he breathed his last, and at the moment of dissolution he held the martyr's right hand. At the obsequies, as one of the attending surgeons, Dr. Leale occupied the carriage immediately preceding the catafalque, and remained at the side of the body at the White House and in the rotunda of the Capitol until the end of the funeral services at Washington. The painting of the "Death of President Lincoln," by Littlefield, represents Dr. Leale as he stood at the right of the President during that entire night. A brief record of his services at this time was printed in the official reports of the Surgeon-General to the Government in the Medical and Surgical History of the War of the Rebellion. While on duty at Washington, Dr. Leale successfully performed an operation on the son-in-law of Governor Fenton, which so pleased the Governor that he personally sought an introduction, and asked if there was anything within the gift of his State that he could offer. The Governor was sincerely thanked by the young surgeon, who replied in the negative, as it might interfere with his mission in life. The mission referred to was that of physician and philanthropist which has been of incalculable benefit to his afflicted fellow creatures. Dr. Leale remained on duty as Executive Officer of Armory Square Hospital until it closed, then was directed to inspect the old military hospitals of the Northern Defenses of Washington, which were saturated with the most malignant septic germs from the thousands of wounded and dying soldiers during the entire war, when, from long exposure to disease, having contracted a severe illness, he was honorably mustered out on January 20, 1866; he subsequently received a brevet commission as Captain United States Volunteers. While still suffering from sickness, he learned that the Asiatic cholera was rapidly spreading through Europe, and that it threatened to reach America. He rose from his sick bed, and in March, 1866, started for Europe, visiting the principal hospitals in England and France. On his return to London, he found that the epidemic had developed in a fatal form in Liverpool, where thousands of emigrants were in transit for America. After receiving an appointment and authority from the British Government, he examined over one thousand of these people who were about to embark for the United States, and rejected all who showed any symptoms of the disease. Through his efforts the spread of the pestilence on the Atlantic Ocean and to America was to a great extent arrested. On May 2, 1866, at a time when Asiatic cholera was most fatal on the ocean, he left Liverpool as surgeon to the Harvest Queen, with 1,003 human beings on board, 836 being steerage passengers. He had completely stamped out on his ship all traces of cholera at Liverpool, but had many hundred cases of lesser troubles, among which

an epidemic of measles arose. After a most tempestuous voyage of thirty-three days, he reached New York, having lost only five of the most feeble ones during the voyage. The *Harvest Queen*, on a later voyage, was lost at sea, not one of her crew or passengers surviving. On the same day, May 2, the *Helvetia* left Liverpool, and in consequence of the rapidly increasing fatality of cholera, she returned to England, after having lost her surgeon and forty of her passengers. On his return home he volunteered to attend those afflicted with the disease in his own district. He labored day and night, and was instrumental in saving many lives. He subsequently published the results of his experience for the benefit of other physicians. In 1866 he married Miss Rebecca Medwin Copcutt, and, with their six children, have a happy American home. From 1866 to 1871 he was physician in charge of the Children's Class at the North-western Dispensary, New York City, and there gratuitously treated over five thousand sick poor children. For the past six years he has devoted his summer vacations to ameliorating the conditions of the exhausted poor mothers having sick children crowded together in New York City, and also the work before being made president, as chairman of the committee of the Sea-Side Hospitals for Children of the St. John's Guild, a unique charitable institution; that during the past twenty-four years has cared for several hundred thousand of the poor weary mothers and their sick children, found by the physicians of New York City, in their visits to the abodes of misery. Dr. Leale is connected, officially and otherwise, with many of the medical and benevolent institutions of New York City; is a member of the board of managers of the New York Society for the Relief of Widows and Orphans of Medical Men, and is a Companion of the first class of the Military Order of the Loyal Legion of the United States. He has been a frequent contributor to medical literature, and is a member of the most important medical and surgical associations of the United States, and actively participated in the discussions of the International Medical Congress, in London, in 1881. For more than twenty-six years of his medical career, Dr. Leale has had a large private practice among the prominent families of New York City. He was one of the original organizers of his College Alumni Association, and was its first chairman. In 1875, he was chosen president of the Alumni Association of Bellevue Hospital Medical College, and in 1886 re-elected for a second term president of the New York County Medical Association. Dr. Leale's most important lectures and writings have been upon the surgery of children, and the surgery of the thorax and lungs. On his retiring from office, the following resolution, offered by Dr. P. B. Porter, in executive session of the New York County Medical Association, and seconded by the late Dr. Isaac E. Taylor, was unanimously adopted: "Resolved, That the special thanks of this association are due to the retiring president, Dr. Charles A. Leale, for the able and courteous manner in which he has presided over its deliberations during the past two years; for the high standard which he has maintained in its scientific proceedings, and for his unremitting labors in furtherance of the general welfare."

LEAMING, James Roseburgh, of New York City, was born in Groveland, Livingston county, N. Y., February 25, 1820, and died December 5, 1892. His father's ancestors came to this country from England in 1663, and settled in Southampton, L. I. His mother's family came from the north of Ireland, or Scotland, in 1730, and his maternal great-grandfather, Rev. John Roseburgh was chaplain of Pennsylvania militia from Allen township during the Revolution, and was killed at Trenton in 1777. Dr. Leaming was educated at Temple Hill Academy, Genesee, N. Y., and graduated in medicine from the medical department of the University of the City of New York in March, 1849, settling immediately after in New York. He was a member of the New York Academy of Medicine; the New York County Medical Society; Pathological Society; Medical Journal Association; and other local societies; also member of the New York State Medical Society, and of the American Medical Association. He was author of "Cardiac Murmurs," "Respiratory Murmurs," 1872; "Plastic Exudation within the Plura, Dry Pleurisy," 1873; "Hæmoptysis," 1874; "Disturbed Action and Functional Murmurs of the Heart," and "Fibroid Phthisis," read before the New York Academy of Medicine, 1876. He held the position of visiting physician to the Northern Dispensary for seven years, and was afterwards attending physician on chest diseases at Demilt Dispensary nine years; for more than ten years visiting physician to St. Luke's Hospital, New York; and consulting physician to House of Rest for Consumptives, Tremont, N. Y. He was Professor of Practice of Medicine for three years in the Woman's Medical College of the New York Dispensary for Women and Children, and was afterward emeritus professor of the same.

LE CONTE, Joseph, of Berkeley, Cal., was born February 26, 1823, in Liberty county, Ga., his father being Lewis Le Conte, a descendant of Wm. Le Conte, a Huguenot, who left Rouen on the revocation of the edict of Nantes in 1685, going to Martinique, and subsequently settling on Staten Island, N. Y. After receiving a preliminary training in the schools of his native county, the subject of this sketch was educated in Franklin College, University of Georgia, from which he received the degree of A. B. in 1841, and that of A. M. four years later. He obtained the degree of M. D. from the College of Physicians and Surgeons, New York, in 1845. After practicing his profession for three years at Macon, Ga., he became a student in organic science and geology under Prof. Agassiz in 1850, since which time he has been a professor of these sciences. He has served as Professor of Geology and Natural History in the University of Georgia, from 1852 till 1857; Professor of Geology and Chemistry, and Professor of Chemistry in the Medical Department of the University of South Carolina from 1857 till 1869. During the late Civil War he served as chemist of the Confederate laboratory for the manufacture of medicines, 1862-63, and as chemist of the nitre and mining bureau, 1864-65. Since 1869 he has been Professor of Geology and Natural History in the University of California. He is a member of numerous medical societies including the State Medical Society of South Carolina and of California.

He is also a Fellow of the American Philosophical Society; and member of the California Academy of Science; National Academy of Science; American Academy of Science and Arts (Boston), and the New York Academy of Science. He is the author of many papers of interest, among which are those "On Science of Medicine and the Causes which have Retarded its Progress," 1850; "Law of Sexes, Review of M. Thury," 1866; "Correlation of Physical, Chemical and Vital Forces," 1873; "A Volume on Science and Religion," 1874; "Relation of Instinct to Intelligence," and a series of articles on "Binocular Vision," 1875; also "Formation of Mountain Chains and the Ancient Glaciers of the Sierra," 1876; "Glycogenic Function of the Liver," 1879; "Ptomaines, and Leucomaines and their Relation to Disease," 1889.

LEE, Charles Carroll, of New York, was born in Philadelphia, March 24, 1838. He was educated at Mount St. Mary's College, Emmitsburg, Md., and graduated thence in 1856. He studied medicine at the University of Pennsylvania, and received his medical degree from that institution in 1859. After graduating he served as House Physician and Surgeon in the Wills' Hospital, Blockley Hospital and the Pennsylvania Hospital successively; and after leaving the latter he entered the United States Army and served as assistant during the War of the Rebellion. In 1867 he was sent to New York as a member of a medical examining board for the army, and after the termination of this service, resigning his commission, he settled immediately in New York in general practice. He is a member of the New York County Medical Society, of the Academy of Medicine, and of the Pathological Society of New York; of the Medical Journal Association and Obstetrical Society. His contributions to medical literature have been on "Gynecology," "Syphilis," "Lithotomy," and other important subjects. He has served as Surgeon of the Charity Hospital; Physician to the New York Foundling Asylum; Assistant Surgeon of Woman's Hospital; and Physician of the Medical Aid Association. In November, 1863, he married Helen Parrish, daughter of the late Dr. Isaac Parrish, of Philadelphia. (Dr. Lee died May 10, 1893.)

LEFFERTS, George M., of New York, was born in that city, February 24, 1846. He was educated at the College of the City of New York, received the honorary degree of A. M. from Dickinson College in 1869, and M. D. from the College of Physicians and Surgeons of New York in March, 1870. He settled in that metropolis, making diseases of the throat and chest a specialty. In July, 1874, he performed the operation of sub-hyoidean laryngotomy—the first and only time it had been accomplished in this country, and the sixth time it had ever been performed. He has been Clinical Professor of Laryngoscopy and Diseases of the Throat to the College of Physicians and Surgeons, of New York; Laryngoscopic Surgeon to St. Luke's Hospital; Surgeon to the New York Eye and Ear Infirmary, and the Demilt Dispensary (throat departments); and chief of clinic to Prof. Karl Störk, in the Imperial University of Vienna. He is a member of the New York Academy of Medicine; of the Medical Journal Association, of which he was corresponding secretary in 1875, trustee in 1876; and president of the Laryngological Society in 1876. He has contributed largely

to medical journals, among his contributions being one "On a New Instrument for the Insufflation of Powders in the Larynx," 1873; "Treatment of two cases of Fibroid Growths by Excision and Evulsion upon the Vocal Cords," "Removal of a Brass Ring, which had lodged in the Larynx, by Sub-Hyoidean Laryngotomy," 1874; "Intra-Laryngeal Growth treated by Excision," 1875; "Prolapse of both Ventricles of Larynx, their removal by Thyrotomy," 1876; "Modern Methods of Examining Air Passages," Seguin's American Clinical Lectures. He has also translated "Fränkel on the General Diagnosis of Diseases of the Nose, Pharynx and Larynx;" in "Ziemssen's Cyclopaedia of the Practice of Medicine. Besides the above he has conducted the quarterly reports of laryngoscopy in the *New York Medical Journal* and the semi-annual reports on syphilis of the mouth, throat, and larynx, in the *Archives of Dermatology*. Dr. Lefferts is widely known as one of the most accomplished and successful laryngologists of this country.

LEIDY, Joseph, of Philadelphia, Pa., was born in that city, September 9, 1823, and died there April 30, 1891. His ancestors were of German descent, and he was destined by his parents to be an artist; but an early fondness for botany and mineralogy led to the pursuit of a different avocation. His leisure hours in early life were passed in a wholesale drug store, where he further acquired a knowledge of pharmacy and chemistry, to which he added comparative anatomy. With this foundation, after receiving a preparatory education in private schools, he began, in 1840, the study of medicine under the preceptorship of Drs. Paul B. Goddard and James McClintock, and was graduated at the University of Pennsylvania, in 1844. He then became assistant to Robert Hare and James B. Rogers, in the chemical laboratory of the university, and also began the practice of medicine. The latter he discontinued in 1846, in order to devote his time exclusively to teaching. Meanwhile, in 1845, he had become prospector to the chair of Anatomy in the University of Pennsylvania, then held by Prof. Wm. E. Horner, and in 1846 he was elected demonstrator of anatomy in the Franklin Medical College, but this he relinquished after a term, in order to return to Dr. Horner, with whom he gave a private course of anatomical lectures, in 1847. In 1848, he visited Europe with Dr. Horner, examining the museums and hospitals there. In 1849 he gave a course of lectures on physiology at the Medical Institute; but on account of failing health these were abandoned, and he again visited Europe, in order to aid Dr. George B. Wood in forming the collection of specimens and models used in the department of materia medica. Owing to Dr. Horner's illness, in 1852, he was called to deliver lectures in his department, and in 1853, on the death of his associate, he was elected to the full possession of the chair of Anatomy, which position, together with that of dean of the faculty, he held until his death. During the Civil War, he entered the United States service as acting assistant surgeon in Satterlee General Hospital, Philadelphia. His special duty was to report on the more important *post-mortem* examinations; and several of his reports, with his own drawings, were published in the "Medical and Surgical History of the Rebellion." In 1871, he was chosen Professor

of Natural History to Swathmore College, and in 1884, on the establishment of the Department of Biology, and the auxiliary department of Medicine in the University of Pennsylvania, he was made its director. He also held the chair of Zoology and Comparative Anatomy in the faculty of the college department of the university. Professor Leidy was an accomplished draughtsman, and as early as 1844, when Professor Binney began the publication of his great work on the "Terrestrial Air-breathing Mollusks of the United States," he selected Dr. Leidy to dissect and draw the internal organs of the species that were to be described. The result was the production of sixteen plates, giving the anatomy of thirty-eight species of native mollusks, and the chapter entitled, "Special Anatomy of the Mollusks of the United States." In 1847, he published his first paleontological paper, "On the Fossil Horse of America," in which he clearly established the former existence of a diminutive species, for which he proposed the name of "*Equus Americanus*." This subject, with later discoveries, in the hands of Thomas H. Huxley and Othniel C. Marsh, has been largely used as a demonstration of the theory of evolution. His work in this direction included the determination of the former existence of a tropical climate on the Pacific slope, in which lived varieties of lion, tiger, camel, rhinoceros, and other forms of animals having no living representatives in the United States. Many of the earlier specimens obtained in the various surveys under the United States Government were submitted to him for investigation and report. His earlier work in paleontology had reference to the extinct mammoth species, but in recent years his studies were devoted to the lower forms of animal creation. Prof. Leidy received the Walker prize of \$1,000 from the Boston Society of Natural History in 1880, and the Lyell medal, with cash prize, from the Geological Society of London, in 1884, as a recognition of his valuable contributions to paleontology, and for the same reason the degree of LL. D. was conferred upon him by Harvard in 1886. He was elected to the Academy of Natural Sciences of Philadelphia, in 1845, and from 1846 till his death, held the office of chairman of curators, and after 1882 was president of that world-renowned institution. In 1849 he was elected to the American Philosophical Society, and was an Associate Fellow of the American Academy of Arts and Sciences. He was chosen to the National Academy of Sciences in 1884, and was a member of numerous other Scientific Societies in this country and abroad. The titles of his published works exceed 800 in number, ranging from pamphlets to elaborate treatises comprehending several volumes, and were all on biological subjects, among which may be mentioned "Memoir on the Extinct Species of the American Ox," 1852; "A Flora and Fauna Within Living Animals," "Ancient Fauna of Nebraska," 1853; "On the Extinct Sloth Tribe of North America," 1855; "The Cretaceous Reptiles of the United States," 1865; "The Extinct Mammalian Fauna of Dakota and Nebraska," 1869; "Contributions to the Extinct Vertebrate Fauna of the Western Territories," 1873; "Description of the Vertebrate Remains from the Phosphate Beds of South Carolina," 1877; "Fresh-Water Rhizopods of North America," 1879; "The Parasites of the Term-

ites," 1881; "On Manayunkia Speciosa," 1883, and "Tapeworms in Birds," 1887. The greater part of his more important works have been issued through the Smithsonian Institution, at Washington, D. C., the Academy of Natural Sciences, of Philadelphia, Hayden's United States Reports of Surveys of the Territories, and under the auspices of the National Government, as special monographs. He edited an edition of Sharpley and Quain's "Anatomy," and also wrote "An Elementary Text-book on Human Anatomy," 1861. In his memory a fund of \$50,000 is being collected, in order to establish a Leidy Memorial Museum as an independent part of the one now forming at the University of Pennsylvania, the institution with which his fame as a teacher and scientist had been for so many years identified.

LENT, Frederick D., of Cold Spring, N. Y., was born at Newbern, N. C., December 23, 1823, and died September 17, 1883. He was of Dutch and Huguenot descent. He was educated at the University of North Carolina, where he was graduated A. M. with the first honor in his class. His medical studies were conducted in the medical department of the University of New York, from which he received his medical degree in 1849. From 1848 to 1851 he was House Surgeon at the New York Hospital, and from the latter year till 1870 he was Surgeon at the West Point Foundry at Cold Spring. He was then appointed Professor of Gynecology and Diseases of Children in the University of New York. He was also Assistant Surgeon of the Woman's Hospital of the State of New York, Surgeon to St. Mary's Hospital, and Consulting Surgeon to the New York Free Dispensary for Sick Children. On account of failing health, he resided during his latter years at Palatka, Fla., in the winter, and in the summer at Saratoga Springs, N. Y. Dr. Lent was an extensive contributor to medical journals, but his writings have not been collected and published in book form. The following articles from his pen are worthy of special note: "Coup de Soliel," among the first contributions on the subject published in this country; "Dangers of Anæsthesia," one of the first efforts to warn against the danger of chloroform inhalation, 1856; "Sedative Action of Calomel," "Intra Uterine Medication," 1870; "Carbuncular Inflammation of the Lip," the first paper calling prominent attention to this peculiar and very fatal disease, and to the diagnosis between this and similar affections; "Albuminuria in Pregnancy and Treatment of Puerperal Convulsions by Morphine," one of the first efforts to establish this treatment; "Hypodermic Use of Ergot in Hemorrhage," the earliest use of this agent for this purpose by this method; "The Neurotic Origin of Diseases and the Action of Remedies on the Nervous System," read before the Neurological Society in 1874. He has devised some valuable surgical instruments employed by gynecologists, and was an active member of various professional societies, many of which elected him to office. He was a founder of the American Academy of Medicine, a manager of the Hudson River State Hospital, and a member of the American Public Health Association, before which he read papers. Dr. Lent was a representative from Florida on the Executive Committee of the Centennial Medical Commission.

LEONARD, Charles Henry, of Detroit,

Mich., was born at Akron, Ohio, March 28, 1850. He is of English descent. His ancestry were early settlers in the State of Connecticut. He received the degree of A. B. from Union College, Schenectady, N. Y., in 1872, and that of A. M. from the same institution in 1882. He studied medicine under the preceptorship of Prof. S. C. E. Weber of Cleveland, O., and was graduated M. D. from the medical department of the University of Wooster, Cleveland in 1874. Dr. Leonard's medical education was supplemented at Bellevue Hospital Medical College and the Women's Hospital, of New York City. Soon after his graduation he located to practice in Detroit, Mich., and has resided there since 1874. He has devoted especial attention to gynecology and in this line has had fair success. He has taken an interest in the collateral sciences in a general way, is something of a microscopist and has devoted considerable time to the study of geology and chonchology. In 1879 he established the therapeutic value of "ustilago maidis" and has devised several instruments of importance in gynecological surgery, such as "Leonard's Vaginal Speculum," "Utero Metric Sound," and "Flexible Probe." He was president of Wayne County Medical Society from 1888 to 1890, and was for three years section officer in the Michigan State Medical Society. In 1879 he was elected to the Chair of Gynecology in the Michigan College of Medicine and held this continuously until 1885, when through consolidation of the two colleges he was appointed to the same chair in the Detroit College of Medicine and holds this professorship at the present time. Dr. Leonard has made important contributions to Medical literature and is the author of several works of great practical value, such as his "Reference and Dose Book," "Auscultation, Percussion, and Urinalysis," "System of Day Books and Ledgers," while his "Pocket Anatomist," "Manual of Bandaging," "Materia Medica and Therapeutics," and the one entitled "The Hair, its Growth, Care, Disease and Treatment," have had a wide circulation in this country, and large editions have been sold in England, and two of the same are reprinted there. He is also editor of numerous smaller works and established *Leonard's Illustrated Medical Journal* in 1879, and has been its editor and publisher continuously since then.

LEUF, Alexander H. P., of Philadelphia, Pa., was born in Brooklyn, N. Y., May 2, 1861, of poor parents, who were both German by birth. The name Leuf is a contraction of Le Bœuf, and the Doctor is related to the French Marshal of that name, the contraction taking place early in the century, as the result of family intrigue and villainy that successfully diverted a large fortune to another branch of the family. Dr. Leuf attended a German Catholic parochial school, between the ages of six and eleven years, when he began to work for a living and in aid of the family, in which he was the oldest of seven children. At the age of fourteen he began attendance upon the Brooklyn Evening High School, in its second year. In this he continued during three seasons, graduating in various branches, among which were anatomy and physiology. His teacher in this was Dr. A. G. Kimberly, a man of fine attainments and superb logical faculties, and an ex-army surgeon. He entered the Long Island College Hospital, at Brooklyn, N.

Y., in the fall of 1878. Here he became the protégé of Prof. Landon Carter Gray, now of New York City, but then Professor of Nervous and Mental Diseases at that institution. He graduated June 14, 1881, receiving many compliments from his teachers for the excellence of his examinations in the scientific departments. He practiced medicine in Brooklyn from the date of his graduation until 1886, when he came to Philadelphia, where he still is, in the active duties of a physician. He is not, strictly speaking, a specialist though having a varied experience in numerous lines of work. His interest in the collateral sciences is keen and active, believing that no man can be a truly good physician who is not almost universally informed. As an anatomist and pathologist he has done some valuable work, as will appear. In surgery, he has done many leading operations, one of the most difficult being, perhaps, an excision of the entire left upper jaw, inclusive of the floor of the orbit and nasal process, as well as half of the malar bone, all of the lachrymal, with the exception of the orbital plate, and almost the entire pterygoid process, for osteo-sarcoma, and all with only a single artery forceps to check hemorrhage. The duration of the operation was only thirty minutes. This was done at the Woman's Hospital, Brooklyn, N. Y., in March, 1884, in the presence of eighteen or twenty of Brooklyn's leading surgeons. Among his original researches may be mentioned his discovery of "Accessory Supra and Infra-Orbital Foramina," appearing in *Seguin's Archives of Medicine*, in June, 1880, and a further note upon the same subject the following February. Another was his announcement, in January, 1885, in the *American Journal of Medical Sciences*, of a "Peculiar Form of Pulmonary Congestion, Causing Sudden Death," and with this he made a plea for aspiration of the heart. He always took a decided stand against the prevailing sentiment of general germ infection, and vigorously announced his views before the Brooklyn Pathological Society in 1886, in a paper published in the only volume of transactions ever issued by the society. In 1887 he announced the result of his investigations by vivisection, clinical and *post-mortem* studies in reference to the use of fluids during the injection of meals, concluding and proving that the desire of the individual was usually a safe guide, and that water taken into the stomach at any time was at once passed through into the small intestines. He also laid stress upon the vertical position of the stomach and its being almost entirely upon the left side of the median line of the body. In 1887 he published the result of his studies of base ball injuries, and especially on "Base Ball Pitcher's Arm," in the *Medical News*, being the first systematic study and published announcement of the pathology and treatment of these conditions. In 1888, he issued his "Hygiene for Base Ball Players," in which he enlarged upon his former publications and brought out additional facts of interest. During the same year he contributed numerous articles on physical education containing novel views upon the subject, generally contenting himself with announcing broad principles and leaving their carrying out to the intelligence of the reader. Among these may be mentioned "Exercise in the Treatment and Cure of Deformities;" "Re-

spiration Exercises, with Special Reference to the Muscles of Respiration," and "Respiration Exercises with Reference to Weak Heart." Here may also be mentioned his paper upon "Physical Education of Children," read before the American Medical Association, Section on Pediatrics, at Newport, R. I., on June 25, 1889, and published in the Archives of Pediatrics, as well as in the *Journal of the American Medical Association*, during that year. He invented a flexible dissecting scalpel in 1881, but did not announce it till October 27, 1891, in the *New York Medical Record*. The only civil offices held by him was that of Vaccinating Physician for the Brooklyn Board of Health in 1885-86, as also the making of *post-mortem* examinations for the coroner of Brooklyn, from 1882 to 1886 inclusive. The only military office held by him was that of Physical Director of the Third Regiment, N. G. P., in 1889. Among the numerous medical positions held by Dr. Leuf may be mentioned, in the order of appointment or election, Assistant Demonstrator of Anatomy, Lecturer upon the Anatomy and Physiology of the Nervous System, and Assistant to the Department of Nervous and Mental Diseases, at the Long Island College Hospital from 1881 to 1884; secretary of the Brooklyn Pathological Society from 1883 to 1886; Pathologist to St. Mary's General and to St. Mary's Female Hospitals and to the Hospital for Nervous and Mental Diseases, Brooklyn, N. Y., from 1883 to 1886; also General Surgeon to the Woman's Hospital of Brooklyn, from 1882 to 1884; and its surgeon-in-chief during part of 1884 while it was being reorganized, and upon his suggestion and with his aid it was converted into the Hospital for Nervous and Mental Diseases. He was Surgeon to the Southern Dispensary and Hospital of Brooklyn, from 1884 and 1885; Associate Visiting Physician Department of Nervous and Mental Diseases, St. Mary's General Hospital, from 1882 to 1886; and Associate Visiting Physician to the Department of Children, St. Mary's Female Hospital, from 1884 till 1886. He was also the senior assistant of Prof. Landon Carter Gray in the department of nervous and mental diseases at the New York Polyclinic from its opening till 1886. Upon his removal to Philadelphia in 1886, he was immediately tendered several positions, but declined all except a private assistant to Prof. Chas K. Mills, and to assist him at the Philadelphia Polyclinic in the department of nervous and mental diseases, where he remained nearly two years, leaving these positions to accept the Directorship of Physical Education at the University of Pennsylvania, which he held for three seasons and then sent an ultimatum to the board of trustees naming the only conditions upon which he could continue to serve the institution with credit to himself and satisfaction to them. This was not accepted, and he left. Among his numerous contributions to medical literature, which altogether amount to more than one hundred and fifty, may be enumerated the following in addition to those already referred to above, to wit:—"Fractures of the Humerus near the Elbow Joint," 1881; "Anomalies of the Brachial Plexus;" "Report of Anatomical Anomalies." His monograph, "The Spinal Nerves," with one unique diagram of all the nerves, and six charts, being the most complete and yet concise description of these parts

ever offered; "The Walsh Case," 1882; "On the Eradication of Syphilis by Surgical Means;" "Treatment of Scarlatina," 1885; "Immunity in Disease," 1886; "Surgical Infection," 1887; "Transactions of the Brooklyn Pathological Society;" "Forcible Feeding of the Insane;" "The Spinal Cord, its Removal;" a series of lay articles on "Domestic Medicine," 1888; "Some Obstetric Cases," 1889; "Physical Education in Nervous Diseases," in *University Medical Magazine*, 1890. Besides these he has made numerous reports of medical and surgical cases, anatomical anomalies, and *post-mortem* findings. He wrote voluminously upon physical education and athletics in lay papers, sometimes over his own name, and at others by pseudonym. As a writer upon economic subjects he also is known to many. As surgical editor of the *American Medical Digest* he annotated excerpts with great freedom besides writing editorials and book reviews. On November 13, 1888, he organized the Physical Education Society of Pennsylvania, and was elected its first president. He positively declined re-election at the end of his year of office, being succeeded by Dr. Benjamin Lee, of Philadelphia. He called a meeting for the formation of an association of American anatomists in Washington, D. C., on September 17, 1888, which was well attended. The association was formed by that name, and Prof. Joseph Leidy was elected president, and Dr. Leuf its secretary-treasurer, in which office he was succeeded by Dr. D. S. Lamb, of Washington, D. C., at the Boston meeting in 1891. The Doctor is now engaged in active general practice, and devotes his spare time to aiding organized labor in its efforts to escape from economic bondage. In the order of the Knights of Labor, of the principles of which he is an ardent supporter, he has risen without effort on his part to the distinguished position of District Master Workman of the celebrated District No. 1.

LEVICK, James J., of Philadelphia, Pa., was born and educated in that city, and is of English descent. His ancestors were Friends and associates of Penn, and in the early history of the colony took an active part in civil and religious society. His literary and classical education was obtained under a private tutor. He graduated at Haverford College, in 1842. He studied medicine in the office of Prof. George B. Wood, and graduated from the University of Pennsylvania, in 1847. He then visited Europe, and on his return was for a little while assistant physician at the Pennsylvania Hospital for the Insane, and was then elected resident physician of the Pennsylvania Hospital, where he remained for over two years. In 1851 he began general practice in Philadelphia, and in the same year commenced giving private medical instruction to the summer pupils of Dr. Wood; and subsequently, in association with Drs. H. Hartshorne, Hunt, Lassiter, and Penrose, was engaged in office and other medical teaching, their pupils in the aggregate numbering over a thousand. He was elected a member of the College of Physicians in 1851; a little later, of the Philadelphia County Medical Society; and, in 1864, became a member of the American Medical Association. He is a member of the Academy of Natural Sciences of Philadelphia, and of the Historical Society of Pennsylvania. His contributions to medical literature have been

various; among them are the following: "Spotted Fever without Cerebro-Spinal Meningitis;" on "Spotted Fever So-called," maintaining its identity with epidemic cerebro-spinal meningitis so-called, its character as a fever rather than as a phlegmasia, and giving preference to the name "Cerebro-Spinal Fever," 1866; "Sun-stroke Treated by the Use of Large Pieces of Ice;" "The Prolonged Use of Hypodermic Injections of Morphia;" "Remarks on Epidemic Influenza;" paper on "Miasmatic Typhoid Fever;" "Remarks on Sun-stroke," in which attention is directed to its resemblance, in many of its symptoms, to an idiopathic fever, and it is suggested that these phenomena may be due to a modification in the nerve centers, from the elevation of temperature, by which the conservative or regulating influence of nervous power is lost in part or in whole; "Remarks on Chorea and Allied Disorders;" "Sketch of the Dance of St. Vitus;" "Notes of Cases of Phthisis Pulmonalis in Pennsylvania Hospital, with Remarks on Cod-liver Oil in Tuberculous Diseases." Besides serving as physician to several smaller charitable institutions, he was elected, in 1853, attending physician to Wills Hospital, and continued so till the junction of the duties of the medical and surgical staff; in 1856, he was elected attending physician to the Pennsylvania Hospital, a position retained till he resigned, in 1868, and where he introduced the use of ice in the treatment of sunstroke. In 1868, he was appointed lecturer on auscultation and percussion, in the summer course of the University of Pennsylvania. During the Rebellion he received the appointment of surgeon-in-charge of the hospital at Twelfth and Buttonwood streets, Philadelphia; organized a military hospital at Hagerstown, as volunteer surgeon, after the battle of South Mountain; and, subsequently rendered efficient aid after the battle of Antietam. Dr. Levis is now one of the oldest physicians of Philadelphia, having been engaged in general practice in that city for more than forty years.

LEWIS, Bransford, of St. Louis, Mo., was born at Ft. Charles, Mo., November 14, 1862. His father, Edward A. Lewis, was formerly judge of the State Supreme Court, of Missouri, and chief justice of the St. Louis Court of Appeals. After acquiring an academic education at the Washington University of St. Louis, Dr. Lewis entered upon his medical studies in the Missouri Medical College, where he was graduated in 1884. Succeeding, through competitive examination, to an assistantship at the City Hospital, he served a year there and was then successively appointed to fill the same positions at the City Poor House and the Woman's Hospital, after which he was made one of the first two senior assistant physicians (newly created positions) at the City Hospital. Upon completing his term of service in this capacity, he was promoted to the (also newly created) position of Assistant Superintendent to the City Hospital, which he held for two years, resigning in 1889, to enter private practice. About that time Dr. Lewis was made editor of *The Weekly Medical Review*, which he conducted until 1891, when he resigned to go abroad. He was also elected Lecturer on Genito-Urinary Surgery and Venereal Diseases, by the Faculty of the Missouri Medical College, the oldest medical college west of the Mississippi. After pursuing special studies in

andrology and attending the clinical service of Fenwick, Harrison and others (London), Guyon and Fournier (Paris), Kaposi, Finger, Grünfeld, Neumann and others (Vienna), he returned and, with the collaborative and editorial support of such gentlemen as Nicholas Senn (Chicago), Joseph Price (Philadelphia), Landon Carter Gray (New York), Tuholske (St. Louis), Finger (Vienna), and Fenwick (London), he inaugurated the publication of *The Medical Fortnightly*, which soon attained recognition as an active exponent of progressive and scientific medical teachings. Dr. Lewis has been an energetic participant in society work; he is a member of the American Association of Genito-Urinary Surgeons; American Medical Association; National Association of Railway Surgeons; Mississippi Valley Medical Association; Missouri Valley Medical Association; American Medical Edi-

Bransford Lewis.

tors' Association; Missouri State Medical Association; St. Louis Medical Society; City Hospital Medical Society (in the founding of which he was largely instrumental), and the Missouri Medical Alumni Association; and honorary member of St. Charles County Medical Society. Though engaged in general journalistic work, Dr. Lewis has taken especial interest in the field of genito-urinary surgery, and the ideas, as well as the original surgical devices, introduced in his contributions on that subject have been well received. He is young in the profession, but he has made rapid strides towards recognition in his chosen field; he has been honored with the appointments of Consultant in Genito-Urinary Surgery to the Missouri Pacific and Iron Mountain Railway Hospital, and to St. Mary's Infirmary of St. Louis. Dr. Lewis has also recently received the appointment of Consultant in Genito-Urinary Surgery and Venereal Diseases to the City Hospital of St. Louis. He was among the

first to perform the operation of supra-pubic prostatectomy in St. Louis.

LEWIS, Daniel, of New York City, was born at Alfred, Allegany county, New York, January 17, 1846. On the paternal side he is of the fifth generation from ancestors who were among the early settlers of Rhode Island, his father, Alfred Lewis, being a native of that State. The latter, who was born in 1817 and died in 1873, married Miss Lucy Langworthy, daughter of Daniel Langworthy, Esq., of Ashaway, R. I., who is still living. The grandfather of Dr. Lewis was Christopher C. Lewis, of Hopkinton, R. I. Born towards the close of the last century, this gentleman early rose to prominence among his fellow-citizens, and was chosen to the office of town clerk of Hopkinton, the duties of which he so faithfully performed that he was retained in the position for the extraordinary period of forty years, by annual re-election. Among the well-known physicians of Rhode Island there have been many bearing the name of Lewis, all more or less closely related to the subject of this sketch. One of these, Dr. Daniel Lewis, of Westerly, was a man of marked ability. Two of Dr. Lewis' paternal uncles and one maternal uncle, also two of his cousins and an elder brother, all entered the medical profession. Dr. Lewis received his early education at the Alfred Academy, and at the close of the term, the Civil War being then in progress, entered the naval service. He remained in the navy until the close of the war, when he resumed his studies, entering Alfred University, from which he was graduated in 1869. He had already devoted considerable time to the study of medicine under the instruction of his uncle, Dr. Edwin R. Lewis, of Westerly, R. I., and upon his graduation at Alfred University he entered the Medical Department of the University of the City of New York, where he took his first course of lectures. He then entered the College of Physicians and Surgeons of New York, and was graduated with the degree of Doctor of Medicine, in 1871. The ensuing two years were devoted to practice in Andover, Allegany county, N. Y., after which he returned to New York City, where he has practiced steadily ever since, latterly making a specialty of surgery. When the New York Skin and Cancer Hospital was established, Dr. Lewis became Assistant Surgeon to that institution, in 1885 was appointed Surgeon, and still holds this position. Shortly after the organization of the Post-Graduate Medical School he became connected with that institution as Lecturer on Surgery, and in 1890 was appointed to the Chair of Special Surgery (Cancerous Disease). His researches in this department of medicine have been exceedingly thorough, and his experience and views have been recorded in a number of valuable papers, which have attracted wide attention in the profession. Among his principal publications may be mentioned the following papers: "Cancer and its Treatment," *American Practitioner*, 1874; "Marsden's Treatment of Cancer," read before the Medical Society of the State of New York, 1878; "Digitalis in the Treatment of Scarlatina," also read before the State Society, in 1882; "The Development of Cancer from Non-malignant Diseases," read before the same body in 1883; "Treatment of Erysipelas," *Journal of Cutaneous and Venereal Diseases*, 1885; "Treatment of Epitheli-

oma with Mild Caustics," in same journal, 1887; "Cancer of the Rectum," *Medical Monthly*, 1887; "The Chian Turpentine Treatment of Cancer," read before the State Medical Society of New York, 1888; "A Malignant Tumor in an Umbilical Sac," with remarks on the "Etiology of Cancer," *Medical Record*, 1889; "Horse-hair Sutures and Drainage," *Transactions of the New York State Medical Society*, 1884, and "Cancer and its Treatment," Geo. S. Davis, Detroit, 1892. Dr. Lewis is an interesting and impressive speaker. A number of his addresses have been published and widely circulated; among others, his address at the Eighty-fourth Annual Meeting of the Medical Society of the State of New York, in 1890, in which he argues strongly and with irresistible logic in favor of State control over the practice of medicine. Dr. Lewis joined the Medical Society of the County of New York in 1873, and for three years was a delegate from it to the State Medical Society, and for five years a member of the Board of Censors. He was elected president of the Society in 1884, and was re-elected to that office in 1885. He is now the editor of the *Medical Directory*, published by this Society. Since 1880 he has been a Fellow of the New York Academy of Medicine, and has served five years as a member of its committee on admissions. He has also been a member of the New York Pathological Society since 1880, and of the New York Dermatological Society since 1885. In 1884 he was elected a member of the Medical Society of the State of New York, and in 1889 had the distinguished honor of being chosen its president. He is likewise an active member of the New York Physicians' Mutual Aid Association, and has been its President since 1887. Dr. Lewis received the degree of Master of Arts, in course, from his *Alma Mater* in 1872, and in 1886, at the semi-centennial of this institution, was further honored with the degree of Doctor of Philosophy. In 1887 he was elected president of the Alumni Association of Alfred University, a position which he held for three years. For purposes of research and recreation Prof. Lewis has visited Europe several times, and in 1882 spent several months in the study of his specialty at the Cancer Hospital in London. For many years he has been an active member and surgeon of Reno Post of the Grand Army of the Republic, in New York City, and in 1887 held the office of Medical Director (with the rank of Brigadier-General) of the Department of New York.

LEWIS, Eugene R., of Kansas City, Mo., was born near Huntsville, Randolph county, Mo., June 7, 1853. His father and mother both died before he was six years of age, and he was received into the family of his uncle, John F. Lewis, Glasgow, Howard county, Mo., by whom he was brought up and educated. He graduated in physical science at Central College, Fayette, Mo., at the age of eighteen. He read medicine, graduating from the Jefferson Medical College of Philadelphia, March 11, 1874, and located shortly after in Kansas City, Mo., where he has practiced his profession continuously since. In 1880, he was elected to fill the chair of Descriptive and Surgical Anatomy in the now University Medical College of Kansas City, which chair he filled till 1889, when he was elected to the chair of Principles and Practice of Surgery,

made vacant by the death of Dr. John W. Jackson, and which chair he still holds, taking much pride in the fact of having delivered the first lecture delivered in this thrifty medical school, repeatedly performing most of the major operations in surgery, and had successfully cut for stone in the bladder (lithotomy) before he was twenty-two years of age. He was coroner of Jackson county in 1877-78; was one of the charter members or the National Association of Railway Surgeons, organized in Chicago, in 1888, including in its membership Canada, Old Mexico, and the United States, and was its first corresponding secretary, and at present the secretary. He is a permanent member of the American Medical Association, a member of his State and local medical societies, and for years a member of the American Public Health Association of North America. He is at present, and has been for several years, health officer of Kansas City; is a member of the surgical staff of the German Hospital; is consulting surgeon of the Missouri Pacific Railway system; local surgeon of Wabash Railroad, and is the English-speaking secretary of the railway section of the Pan American Medical Congress, which meets in Washington, D. C., in September, 1893. He has just been elected by the World's Fair Commissioners a member of the advisory council of a World's Public Health Congress, to be held in Chicago during the World's Fair. He is the Missouri member of the advisory council of the American Public Health Association, and was elected by the Missouri State Medical Society as a delegate to the twentieth annual meeting of that body in the City of Mexico, Mex., which was in session from November 29 till December 2, 1892. In April, 1880, he married Nannie L., only daughter of Dr. H. W. Pitman, of Jonesburg, Mo., by whom he has living two sons.

LINK, Edwin William, of Palestine, Texas, was born March 31, 1858, in Anderson county, that State, and is of Anglo-Saxon family descent. His literary education was received in the schools of his native county, and by four years' attendance at Hamden Sidney College, Prince Edward county, Va., from which institution he received the degree of A. B. in 1880. His medical preceptor was Dr. H. H. Link, of Palestine, Tex. He was graduated in medicine at the Bellevue Hospital Medical College in 1883, and his medical education was supplemented at the New York Polyclinic in 1892. After receiving his first medical degree (1883) he located in the town of his birth (Palestine, Tex.,) where he has continuously and successfully been engaged in the general practice of medicine and surgery, and is regarded as one of the most prominent of the younger medical men of his State. He is an honored member of the State Medical Society of Texas, and of the American Medical Association.

LITTLE, James Lawrence, of New York, was born in Brooklyn, N. Y., February 19, 1836, and died in the former city, April 4, 1885. His professional education was obtained as a student under Dr. Willard Parker, and at the College of Physicians and Surgeons, New York. Graduating M. D. in March, 1860, having previously served six months as junior assistant physician to Bellevue hospital, he was appointed junior assistant to the New York Hospital soon after his graduation, and was subsequently raised to be senior assistant

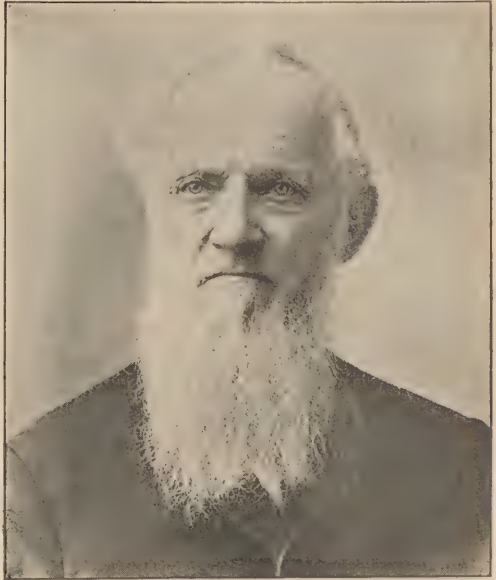

and afterwards house surgeon. After holding this latter post for a year, he was in 1862 appointed surgeon-in-charge of the Park barracks. In 1863 he was appointed clinical assistant to Prof. Willard Parker in the College of Physicians and Surgeons, and in 1864 he delivered his first course of lectures in the spring term of that college on fractures and their treatment. These lectures were delivered annually until 1868, when a regular summer faculty was formed, in which he was appointed lecturer on operative surgery and surgical dressings, a position which he held for several years. In 1875 he accepted the Chair of Surgery in the University of Vermont, still, however, retaining his residence in New York. He was appointed, in 1865, Consulting Surgeon to the Northwestern Dispensary; in 1868 Attending Surgeon to St. Luke's, and in 1876 Attending Surgeon to St. Vincent's Hospitals. He was recognized as one of the most accomplished and successful surgeons in difficult cases that this country has ever produced. He rendered valuable service to the National Government during the Civil War, and in the spring of 1864 he joined in the movement in the direction of sanitary reform in New York City, and was instrumental in the formation of the present board of health of that metropolis. He was a permanent member of the American Medical Association and of the New York State Medical Society; Fellow of the New York Academy of Medicine, and a member of the Pathological, County Medical, and Northwestern Medical and Surgical Societies and of the Medical Journal Association. As an author his publications were confined to contributions to professional periodicals, and to the Transactions of the several societies, of which he was a member. One of his most important papers, published in 1861, described a new method, which has since been very generally adopted, of making splints of plaster of Paris. This paper, considerably enlarged by the author, was republished and extensively circulated by the Sanitary Commission, and at the session of the American Medical Association in 1867, he presented a report upon "The Use of Plaster of Paris in Surgery." Of his other important publications may be mentioned: "Median Lithotomy," a subject upon which he speaks authoritatively, having performed the median operation more frequently than any other now living American surgeon; and reports of "Excision of the Lower Jaw for Osteo-Sarcoma;" "Anchylolysis of the Temporo-Maxillary Articulation, Successfully Treated by Excision of the Right Condyle;" and "Naso-Pharyngeal Tumor Removed by Galvano-Cautery."

LOGAN, Cornelius Ambrose, of Chicago, Ill., was born in Deerfield, Mass., August 24, 1832, of American parents, of Irish and Welsh descent. His literary education was obtained at a local college in Cincinnati, O. He began the study of medicine under Prof. John T. Shotwell, and completed it after the death of this preceptor, under Prof. Reuben D. Mussey. Both of these were distinguished surgeons of the West some forty years ago. He was graduated in medicine at the Miami Medical College in 1853; received the *ad eundem* from the Ohio Medical College in 1857, and the same from the Bellevue Hospital Medical College in 1868. He was appointed resident physician, after competitive examination, to St. John's

Hospital, Cincinnati, which position he filled for two years. He was assistant to the professor of chemistry in Miami College, and lecturer upon that branch in the summer course of the same school. He removed to Leavenworth, Kan., in 1858, and began the practice of his profession. He established and edited with Dr. T. Links, *The Leavenworth Medical Herald*, the first medical journal published in Kansas. For some fifteen years he was one of the foremost physicians of that State. He was one of the first presidents of the Kansas State Medical Society, and took a leading part in every movement, State and local, in the interest of medicine. He was appointed at the outbreak of the Rebellion, to be President of the State Board of Medical Examiners, which board examined all applicants for the post of regimental surgeon throughout the war, and during the frequent border battles he was often at the front. He was appointed botanist to the first geological survey of Kansas, and made an able report upon the botany and sanitary relations of the State. He received the degree of A. M. from Yale College in 1868, and the degree of LL. D. from the National University of Chile in 1884. He served as United States minister to Chile from 1873 to 1877, and then resumed the practice of medicine in Chicago from 1877 to 1879. During this time he published "The Physics of the Infectious Diseases," illustrating the subject with original observations upon the physical and medical aspects of the west coast of South America. In 1879 he was appointed United Minister to the five Central American States, with residence at Guatemala. In 1882 he was reappointed Minister to Chile, and returning in 1886, he spent a year in the schools and hospitals of London, Paris and Berlin. During his twelve years' service in the diplomatic field, he not only achieved a brilliant reputation as a diplomatist, but he also became distinguished for the promotion of the interests of medicine. His large experience in hospitals and schools enabled him to benefit in many ways those of the Spanish-American republics, and many modern ideas and improvements in both are to be credited to him. During his residence in Chile he used his official and personal influence to break down a very exclusive regulation of the State Board of Medical Examiners of that country, before whom all persons desiring to practice medicine in the republic must appear and submit to a rigid examination. This regulation permitted no applicant to be examined not holding a diploma from a college with which the board were "in correspondence." Up to that time the Harvard diploma was the only one recognized; but after a severe struggle Dr. Logan succeeded in having all of the reputable medical schools of the United States officially recognized for all time. He has been the recipient of many civil honors, and of these it may be mentioned that he was elected in 1872 to the position of Grand Secretary of the Order of Odd Fellows in America, which position he filled with great ability for two years. After his return from Europe he settled to the practice of medicine in Chicago, though to a limited extent, and he was again temporarily interrupted during the year 1890, when he was sent to Europe as the first Commissioner of the World's Exposition, to be held during 1893. His contributions to medical literature and to general science are scattered

through many publications, and cover a wide range of subjects.

LOGAN, Joseph Payne, of Marietta, Ga., was born in Botetourt county, Va., November 20, 1820, and died June 2, 1891, in the seventy-first year of his age. He was educated at Washington College, in his native State, and graduated in medicine from the University of Pennsylvania in 1841. He practiced for a brief period at Baltimore, and was Professor of the Principles and Practice of Medicine in Washington University of that city, but made Atlanta the permanent field of his professional life. He was appointed Professor in the Atlanta Medical College, of the departments of Physiology and Principles of Medicine. He also edited the *Medical and Surgical Journal*, of that city. He had been president of the Georgia Medical Association, of the Atlanta Academy of Medicine, and was one of the earlier vice-presidents of the American Medical Association, having held that office from 1860 till 1863. He was for a time a member of the State Board of Health of Georgia, in which capacity he contributed several valuable reports upon yellow fever and other epidemic diseases.

Wm Lomax

LOMAX, William, of Marion, Ind., was born in Guilford county, N. C., March 15, 1813, and died at his home, April 27, 1893. He was a son of Abel and Elizabeth Lomax, of English, Welsh, and Irish descent. He came with his parents to Indiana, in 1817, about the date of the admission of that State into the Union. His father removed to Wayne county when he was five years old, and his home until early manhood was in that county. His early education was necessarily of backwoods order, but this was supplemented by an extensive course of reading under his father's watchful care. He began the study of medicine in Dr. Joel Bugg's office, at Newport, in 1834. In 1836, he entered the Medical College of Ohio, at Cincinnati. In 1837 he located at Marion, when the place was but a muddy vil-

lage, entering the office of Dr. John Foster, where he remained three years. In 1847 and 1848, he attended lectures at the Indiana Medical College, and received his medical degree, afterward entering the University of the City of New York, where he again graduated in 1850. He practiced at Marion until 1861, when he began enlisting volunteers for the Civil War, and was made surgeon of the regiment, his being the first surgeon's commission issued by Governor Morton. He was always near the Twelfth Indiana Infantry throughout the Rebellion, his skill resulting in his being called to act as surgeon-in-chief of division and medical director of the Fifteenth Army Corps. His wife, *nee* Sarah Van de Vanter, went with him to help care for the wounded, but fell a victim to disease, and died at Sharpsburg, Maryland, December 24, 1861. After his return from the war, he married Miss Maria Hendrix, of Wabash, Indiana, who survives him. Dr. Lomax was one of the organizers of the Grant County Medical Society in 1848, and by his unremitting interest and work, that society has stood at the head of the list of county medical societies of his State since its organization. He represented that medical society at the third annual meeting of the American Medical Association at Cincinnati, in May, 1850, and was therefore one of the earliest members of the American Medical Association. He was one of the founders of the Indiana State Medical Society; was its president in 1856, and when it was reorganized and counted into a delegate body in 1866 he took an active part in the plan of reorganization, and was the author of its present constitution. He was a frequent contributor to its annual volume of Transactions. To each of these meetings he rode on horseback to and from his home. He attended the meetings of those societies almost unfailingly for nearly forty years, and until the infirmities of age positively precluded his leaving home. He was appointed a member of the first State Board of Health in Indiana, and served as its president for four years. Dr. Lomax was a man of rare executive ability and prescience. He became convinced that the highest degree of usefulness and good was not attained by the organization of his State Medical Society under its original incorporation. He therefore earnestly studied the matter and was the first to agitate the question of the reorganization of the Society and establishing it on the basis where it rests to-day. He lived to see his fondest hopes realized, and the Indiana State Medical Society, without peer and its organization referred to as the ideal one. Dr. Lomax was one of the best known of the old-school surgeons in Indiana, and made many valuable contributions to medical societies and literature, and preserved a careful record of cases. He is credited with having performed the "flap" amputation below the knee, fifteen years before the earliest recorded operation of that description. He was a man who always devoted his spare time to his own higher education, and did much to help others do the same. His entire life was one of singular purity and nobility of character. He was an earnest, faithful, unassuming Christian gentleman, a member of the Methodist Episcopal Church for nearly sixty, years and a most upright and honored citizen. "In all the long record of his earthly career, there is

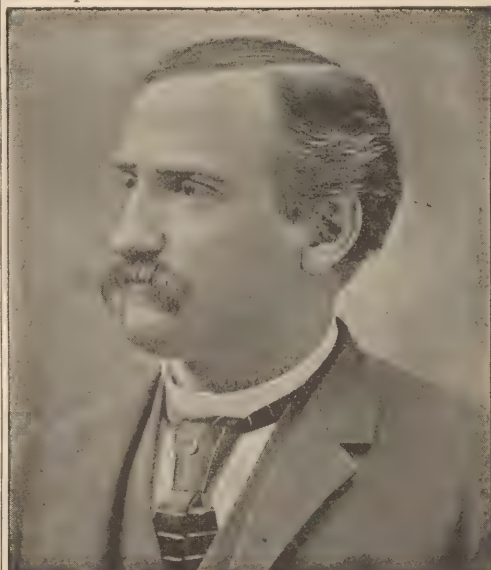

naught to remember of him but usefulness and kindness. In public and private life he was the same unassuming and kindly gentleman. He was the friend of the poor and dependent, and the unfortunate and suffering. In his skillful care all fared alike. His charity was unbounded. He speedily gained the confidence of the people, and maintained it during the half century that he spent in active practice in his community." It is said that while in the army he was untiring in his devotion in alleviating the sufferings of the soldiers, and often went forward into the battle where the dead and wounded were lying, to attend more promptly to the calls made upon him. Dr. Lomax was a constant advocate of every measure having for its object the advancement of medical science and professional dignity, he was at all times outspoken in his contempt for unprofessional conduct of those physicians who seek to gain practice and notoriety by resorting to the tricks and dishonorable schemes of quacks and charlatans. For a time he held the chair of Surgery in the Fort Wayne Medical College. He held the position of president of the board of trustees of the Medical College of Indiana for several years, and the present welfare and future usefulness of this institution was a source of very great interest to him. He was noted in the State for his pronounced views as to the necessity of young men securing an elaborate preliminary education before entering upon the study of medicine. He was exceedingly generous with his means, when young men desiring a sound education to fit them for their professional work attracted his attention. During his long professional life he devoted thousands of dollars to this purpose. His love for his profession, and his earnest desire to promote its interest especially in the direction of a higher medical education induced him, about two years before his death to make a munificent gift to the Medical College of Indiana. This bequest consisted of property near Marion, valued at about \$50,000. He also made other provisions for the college, the details of which have not been published, but which will bring the total amount up to about \$75,000. Dr. Lomax was a high degree member of the Order of Free Masons, having taken the highest degree in America. At the recent meeting of the Indiana State Medical Society, Dr. E. S. Elder, the secretary, in his report, in referring to the death of Dr. Lomax and others, said: The familiar faces and figures of these old members will be sadly missed, especially of Dr. Lomax, who, having become a member of the society in 1850, has rarely ever missed one of its meetings. No man ever exerted a greater influence for the welfare of our society than he. These men may be said to have belonged to the heroic age of medicine in our State. They fought battles, won victories, endured hardships, and in various ways prepared the way for our present flourishing society. The remnant of these heroes constitute the old guard, ever vigilant and faithful; although dying, they never surrender. If we are as true in maintaining the honor and dignity of the profession throughout the commonwealth as those veterans have been in placing us in the favorable position we now occupy, the future prosperity and honor of our society is secure. Dr. Lomax lived the ideal life of the highest type of Christian manliness. After

devoting himself to the relief of distressed humanity, at the close of more than four-score years, full of wisdom and good works, with unclouded intellect, and a firm reliance on the promise of future happiness, he went down to a death as calm and beautiful as the setting of the unclouded sun on a summer evening.

LONG, Crawford W., of Athens, Ga., was born in Danielsville, Madison county, that State, November 1, 1815, and died June 16, 1878. His father, James Long, was a noted politician of Georgia. His grandfathers served in the Revolutionary War. Dr. Long received his general education at Franklin College, Pa., from which he was graduated in 1835 and attended the medical department of the University of Pennsylvania, from which institution he received his medical degree in 1839. He then practiced his profession at Jefferson, in his native State, for the next twelve years, and removed to Athens, Ga., in 1851, where he continued in the general practice of his profession until his death. He claimed that he performed on March 30, 1842, the first surgical operation with the patient in a state of anesthesia from the inhalation of ether. In his history of the discovery of anesthesia Dr. J. Marion Sims says: "Dr. Long was the first to intentionally produce anesthesia for surgical operations, and that this was done with sulphuric ether; that he did not by accident hit upon it, but that he reasoned it out in a philosophical and logical manner; that Horace Wells without any knowledge of Dr Long's labors demonstrated in the same philosophical way (in his own person) the great principle of anesthesia by the use of nitrous-oxide gas in December, 1844, thus giving Long the priority over Wells by two years and eight months, and over Morton who followed Wells in 1846." In connection with this subject, however, the editor of this work desires to call attention to the apparent justness of the claims of one who is still living, and whose biographical sketch is printed on another page of this volume. He now refers to the venerable Dr. Wm. E. Clarke of Chicago. Professor Lyman (on page 6) in his work on "Anesthesia," states that Clarke, while a student in Prof. E. M. Moore's office, in Rochester, N. Y., in the winter of 1842, administered ether to a young woman, who after resisting the efforts of a dentist to extract a diseased tooth, became seemingly unconscious under the effects of the ether and the tooth was extracted without pain. Professor Moore recently stated that at that time he was of the opinion, that the woman in a hysterical freak feigned unconsciousness, and for that reason advised his pupil to make no more experiments in that direction, and that his advice was unfortunately followed. Dr. Clarke was therefore one of the very first, if not the first, to use ether as an anesthetic, and as the above communication was received too late to add to his biographical sketch the honor thus due him should be here recorded. The name of the subject of this sketch, with Wm. T. G. Morton, Charles T. Jackson, and Horace Wells, were presented in a bill before the United States Senate in 1854, to reward the probable discoverers of practical anesthesia. Dr. Long's contributions to medical literature relate chiefly to his discovery.

LONG, Robert William, of Indianapolis, Ind., was born in New Maysville, that State, December 11, 1843. He is of English ances-

try, and a son of the late Dr. William Long, one of the noted pioneer physicians of Indiana. The subject of this sketch obtained his general education at the common schools in the vicinity of his home and at Franklin College, in his native State. During the early part of the War of the Rebellion he enlisted as a private soldier in the Seventy-eighth Indiana Infantry, and upon the expiration of his term of service, began the study of medicine, under the preceptorship of his father. He attended his first course of lectures at the Rush Medical College, Chicago, in 1864-65, and the following year entered the Jefferson Medical College, Philadelphia, when Gross, Dunglison, Pancoast and other noted teachers in that school were at the height of their renown, and was graduated in medicine from that institution in 1866. Although the youngest of his class, he was awarded a valuable prize by Prof. Ellerslie Wallace, on account of his proficiency in the department of obstetrics. While in Phila-

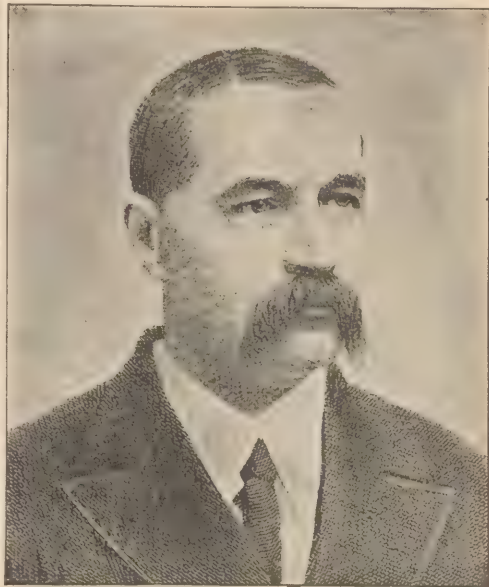

Robert W. Long.

delphia he also attended the School of Preparation for a medical degree and for appointment on the Medical Staff of the Army and Navy and received a diploma therefrom. In addition to these advantages, his medical education and training were supplemented by an attendance at the Bellevue Hospital Medical College, New York, from which he received an *ad eundem* degree in 1869. On returning to his native town from Philadelphia in 1866, Dr. Long, in association with his father, established himself in a large and lucrative practice, which continued to engage his time and attention for the next ten years. In 1871 he married Clara J. Parsons, daughter of the late Dr. William Parsons, a distinguished physician of Montgomery county, Ind. To this faithful companion and accomplished lady much of his success in after life is due. In 1875, at the earnest solicitation of his friends, he was induced to remove to Irvington, a beautiful suburb of Indianapolis, noted for its elegant homes, refined society and cultured citizens. His experience and professional skill

secured for him at once an active and extensive field of practice, which he held for the next fifteen years. Having already acquired a considerable number of patrons in Indianapolis, and desiring to renounce some of the more objectionable features of a semi-rural practice, such as continuous night-riding and exposure during the winter months, he removed to that city in 1891, where he still pursues his professional avocation, but devoting more time to consultation and office practice than previously. While Dr. Long has always been engaged in the general practice of medicine, he has devoted special attention to obstetrics and the diseases of women and children, in which field probably no man of his age in Indiana has had more experience or better success. It is said that as a physician the importance of the disease, without regard to any other consideration, has been his main incentive in the care of his patients. He is a member of the Marion County Medical Society, of the Indiana State Medical Society, and has been for many years a member of the Board of Trustees of the Central College of Physicians and Surgeons, Indianapolis. He has made important contributions to medical journals, mainly relating to cases occurring in his own medical experience, and has been the preceptor of several medical students who have attained prominence in the profession, while his extensive consultation practice has enabled him to impart much valuable knowledge to his professional colleagues. Dr. Long is a man of affairs and of excellent business capacity, who has accumulated a fortune through his professional work and judicious investments. He is a staunch Democrat, whose judgment and advice is often sought in the councils of his party. His indomitable energy, industry and integrity, with a genial, encouraging disposition and an ability to discern and adapt himself to all the varying phases of "human nature," are traits of character which serve to explain the secret of his success in his chosen avocation, and which warrant the prediction of achievements still more brilliant in the future.

LOOMIS, Alfred L., of New York City, was born in Bennington, Vt., October 16, 1831. His early education was obtained at Hoosick Falls and in Rochester, N. Y. He also entered Union College, from which he graduated in 1850, and received his degree of A. M. in 1856. He studied medicine with Dr. Willard Parker of New York, and in the College of Physicians and Surgeons in that city, receiving his degree of M. D. from that institution in 1852. Immediately after graduating he entered the hospitals on Ward's and Blackwell's Islands, as assistant physician, a position he held for two years. He afterwards established himself in New York in general practice, but with special attention to diseases of the heart, lungs and kidneys, in which field he has become eminent. In 1859 he was appointed Visiting Physician to Bellevue Hospital, and subsequently Visiting Physician to the Charity Hospital on Blackwell's Island. In 1862 he was appointed Lecturer on Physical Diagnosis in the College of Physicians and Surgeons, New York, a position he retained three years. In 1866 he was made adjunct Professor of Theory and Practice of Medicine in the University of New York, and two years later Professor of Pathology and Practice of Medicine

in the same institution, which chair he still holds. "An unknown friend of the University gave through Dr. Loomis in 1886 the sum of \$100,000 to the medical department, to build and equip the Loomis laboratory, which is

Alfred L. Loomis.

intended to be the finest and most complete of its kind in the United States." Dr. Loomis is an active and honored member of numerous medical societies both in this country and in Europe, and has been president of the New York Pathological Society, and also of the New York State Medical Society. He is the author of a treatise on "Physical Diagnosis," published in New York in 1873 (tenth edition revised and enlarged in 1893); and also of a volume on "Diseases of the Respiratory Organs, Heart and Kidneys," published in 1876; "Lectures on Fevers," "Diseases of Old Age," 1882; and "A Text-Book of Practical Medicine," 1884.

LOVE, I. N., of St. Louis, Mo., was born in Barry, Pike county, Ill., his father having emigrated thither from Old Virginia, and his mother being a native of Kentucky. Referring to the subject of this sketch, Dr. L. S. McMurtry, of Louisville, Ky., writes as follows: His early youth was spent in the vicinity of the place of his birth, and when thirteen years of age he went to St. Louis, and became a member of the family of his relative, the late Dr. John T. Hodgen, who at that time, and for years afterward, was the most eminent surgeon in St. Louis and the West. Here his studies were directed at the St. Louis High School, and in private schools, with a view to his entrance upon the study of medicine, which course he followed under the admirable practical directions of Dr. Hodgen. Indeed, he was in reality a student of medicine before he formally matriculated in the St. Louis Medical College. In 1872 he received the degree of M. D. from the old St. Louis Medical College, which was located at the corner of Sev-

enth Street and Clark Avenue. In the competitive examination, open to all the graduates of the medical schools in St. Louis, he won the position of assistant resident physician at the City Hospital, where he remained two years in the active discharge of his duties, and then became an assistant of Dr. Hodgen. This latter year was perhaps the most valuable of all his medical pupilage. Soon after entering upon private practice, he was appointed city physician of St. Louis, which position he occupied for more than a year. Resigning this, he gave all his attention to the development of his private practice, which was rapidly growing in the west end of the city. Up to this time, Dr. Love's studies and associations with

J. N. Love

Professor Hodgen had encouraged his tastes and developed his qualifications in the line of surgery, although his hospital experience and private practice had given him a rich experience in all departments of medical, surgical and obstetrical practice. He was for some time a teacher of physiology in the St. Louis Medical College. At this time he married, and about the same time the position of demonstrator of anatomy was offered him. With a family of his own, and an extensive private practice, he accepted the demonstratorship and determined to make of himself an all-round practitioner. An innate fondness for children, and a deep sense of the imperfect knowledge of children's diseases at that time, together with an appreciation of the high rate of infant mortality in large cities, determined him to devote special attention and study to the diseases of infancy and childhood. He

soon afterwards made several contributions of practical character to the literature of pediatrics, and his practice in this special field rapidly increased, his services being sought both by the public, and by his professional colleagues in consultation. In 1889 he accepted the chair of Pediatrics in the St. Louis College of Physicians and Surgeons, and continued to write and teach this important practical branch to which his studies were directed. In 1887 he was secretary under the presidency of Dr. J. Lewis Smith, of New York, of the Pediatric Section of the Ninth International Medical Congress, at Washington. The same year he was elected president of the Mississippi Valley Medical Association, probably the second largest medical organization in America. In 1889 he was elected president of the Section of Diseases of Children of the American Medical Association, and during the same year was elected a member of the board of trustees of the *American Medical Association Journal*, the duties of which latter position he discharged for three years. During the same year he was elected president of the American Medical Editors' Association, being at that time an associate editor on the staff of several well-known medical periodicals. Dr. Love was several times solicited during these years to accept chairs in medical colleges, but it was only three years ago that he assumed active duties as a professor, when he became one of the charter members of the faculty of the Marion-Sims College of Medicine in St. Louis, occupying the chair of clinical medicine and diseases of children. The success of this school has been phenomenal, and a goodly share is credited to the energy and ability of the subject of this sketch. Hitherto his teachings were devoted to Pediatrics, but here he soon demonstrated his especial fitness for clinical teaching in the broad domain of general medicine and diseases of children. In January, 1890, Dr. Love issued the first number of the *Medical Mirror*, announcing that this journal was not established to fill any long-felt want, but wholly from the fact that its owner and editor confessed a fondness for medical journalism, and believed he could be of service to his profession in this way. As a result of his experience in journalism and his wide reputation as a forcible, ready and interesting writer, the *Medical Mirror* at once took place in the very front rank of medical journalism in America. It has grown in circulation and influence, and is probably the most popular monthly medical magazine in America. The editor and proprietor discharges all the duties in his characteristic, thorough and pleasing style, and discards the padding and impersonal editorials and comments, which characterize so many medical periodicals. In the midst of a large and busy practice he found time three years ago to prepare an elaborate monograph entitled, "Practical Points in the Management of the Diseases of Children," which was published in the Leisure Hour Series, put before the profession by George S. Davis, the enterprising medical publisher of Detroit. Dr. Love is a member of the committee on organization, appointed by the American Medical Association for the Pan-American Medical Congress to be held in Washington, September, 1893. He is a member of the board of trustees of the congress, assistant secretary-general, and also honorary president of the section on diseases

of children of the congress. At the meeting of the American Medical Association in Milwaukee, June, 1893, he received the distinguished honor of being elected vice-president of the association. Dr. Love possesses a genuine love for his profession, is thoroughly practical and profoundly versed in all the varied field of internal medicine. He has by nature great energy, keen perception, and a personal magnetism which makes him welcome to the homes of his patients and gains for him hosts of warmly attached friends at home and abroad. He is eminently a practical man, and his greatest success in life has been demonstrated in his work at the bedside of his patients. As a diagnostician he is quick, accurate, and thorough; in practical therapeutics he is scientific and successful. As a teacher he has the gift of enthusiasm which is contagious, and awakens the interest and attracts the confidence of his pupils. He is widely known in the profession as a gifted and charming after-dinner speaker, and at all large gatherings of the profession he is invited to entertain and instruct with his happy and erudite expression. Dr. Love is a man of positive convictions, and whatever he undertakes throws his whole soul into its accomplishment. His motives are generous and his impulses are kind; and when he errs he is the first to repair any injustice that he may unintentionally do any one. He draws to himself friends wherever he goes, and is withal a genial, accomplished gentleman. He leads a busy life and gives to his professional labors all of his time and strength. He is about forty years of age, and possessed of a strong constitution, and it is reasonable to expect that with his characteristic energy and devotion he will be spared many years to the labors which have distinguished him in his profession. His interesting family consists of his accomplished wife and two children, a daughter and son, the latter bearing the name of his early friend, preceptor and illustrious kinsman.

LUSK, William Thompson, of New York, was born at Norwich, Conn., May 23, 1838. He entered the class of 1859 in Yale, but left on completion of Freshman term. He received the honorary degree of A. M. from that institution in 1872. He studied medicine for three years in Heidelberg and Berlin (1858 to 1861); returned to America and served in the United States Volunteer Army during the first three years of the Rebellion, beginning as a private in the ranks, and being successively commissioned second lieutenant, first lieutenant, captain and assistant adjutant-general. He then attended lectures at the Bellevue Hospital Medical College, and was graduated thence M. D. in 1864. He subsequently spent a year and a half in study in Edinburgh, Paris, Vienna and Prague, and in 1865 established himself in practice in New York. He is a member of the New York County Medical Society; Fellow of the New York Academy of Medicine; member of the New York Obstetrical Society, vice-president in 1875; member of the American Gynecological Society, and a corresponding Fellow of the Edinburgh and London Obstetrical Societies. From 1868 to 1871 he was Professor of Physiology in the Long Island College Hospital. In 1870 he became Lecturer on Physiology in Harvard Medical School. He has been Professor of Obstetrics, Diseases of Women, Diseases of Infants, and Clinical

Midwifery in Bellevue Hospital Medical College since 1871, and has been editor of the *New York Medical Journal*. He is Gynecologist to Bellevue and St. Vincent Hospitals, and Obstetric Physician to the Emergency Hospital. Of his numerous articles in periodicals may be mentioned the "Histological Doctrines of M. Robin;" "Uremia a Common Cause of Death in Uterine Cancer;" "Inquiry into the Pathology of Uterine Cancer;" "Irregular Uterine Action During Labor;" "Clinical Report of the Lying-in Service at Bellevue Hospital for the year 1873;" on the "Origin of Diabetes, with Some New Experiments Regarding the Glycogenic Function of the Liver;" the "Cephalotribe and Cephalotripsy," 1867; the "Genesis of an Epidemic of Puerperal Fever," 1873; "Morphia in Child-Birth," 1877; "Nature, Causes, and Prevention of Puerperal Fever," Transactions of International Medical Congress, 1876; on the "Necessity of Caution in the Employment of Chloroform During Labor," American Gynecological Transactions, 1877. In 1867 he published a description of a new cephalotribe weighing less than two pounds. He is the author of "The Science and Art of Midwifery," published in 1881 (an enlarged edition in 1885), which has been translated into several European languages.

LUZENBERG, Charles Aloysius, of New Orleans, La., was born July 31, 1805, and died July 15, 1848. He was a native of the city of Verona, where his father, an Austrian of ancient and respectable family, had followed the army in the capacity of commissary. Soon after his birth, his father returned with the army to Alsace, residing with his family alternately at Landau and Weissenberg. At the latter place, one of his uncles was established as a practitioner of medicine, a circumstance which, perhaps, suggested the idea of educating him for that profession. His biographer, Dr. T. M. Logan, in an interesting sketch, published in the "American Medical Biography," says: His earliest tuition was at the public school of Landau, where his precocity first evinced itself, in the rapidity with which he learned arithmetic, and the French and Latin languages. Afterwards, when his father removed to Weissenberg, he was received into the city college, at the early age of ten years, being the youngest pupil ever admitted. On account of his attainments, the rules for admission were waived in his favor, and he was held up as a model to the other scholars. In the year 1819 his father left his native country, and settled with his family in Philadelphia, and sparing no expense, sacrificed almost all his means to procure for his eldest son every facility his adopted city could afford for the completion of his studies. True to the German standard of a perfect education, he was taught music, fencing, boxing, and other exercises in gymnastics, and soon acquired the same proficiency in his athletic training as he afterward attained in the medical arena. In 1825 he attended the lectures of the Jefferson Medical College, and evinced such assiduity and zeal in the acquisition of knowledge, especially in the dissecting rooms, as to furnish, even at that early period, strong indications of his future eminence. Although he made the study of his profession the base-line of his pursuits, he did not neglect to prosecute the departments of classical literature, and especially natural history; which latter he made

subsidiary to comparative anatomy. At this period, Dr. Physick was in the zenith of his surgical career, and it is presumed gave a bias to the mind of his hospital pupil for his particular department. Hence, surgery became his ruling passion; and he spared no trouble or pains, by constant attendance at the almshouse, or by going almost any distance to witness an important or interesting operation. In the year 1829, he went to New Orleans, taking with him many most flattering letters, but contenting himself with delivering a single one to Dr. David C. Ker, one of the visiting physicians to the Charity Hospital. On his first visit to that institution, upon the invitation of Dr. Ker, he performed a difficult amputation, in a manner so satisfactory, and so indicative of that courage and genius, which were soon to ripen into maturity, that he was almost upon his arrival, and when scarcely known to the administrators, elected house-surgeon. In this situation his talents found a field somewhat commensurate with their extent, and which soon brought him a rich harvest of celebrity and reputation. The abundant opportunities here afforded of witnessing every variety of calamity and casualty to which suffering humanity is subject, and the many emergencies which tasked his judgment, boldness, and address, soon enabled him to acquire those qualities which are found in all great surgeons—a sure and steady hand, an imperturbable self-possession, and a quick sagacity to seize new indications and employ, at the instant, the means of fulfilling them. These were only some of the evidences of his genius for surgery, which were now developed. While in pursuit of surgery, his earliest and his first love, he was not unmindful of the importance of the other departments of his profession. About this time his attention was attracted to the numerous cases of small-pox which were received into the Charity Hospital. While engaged in the *post-mortem* examination of a patient, who had been some years previously so afflicted with small-pox as to produce deep pits upon the face, Dr. Luzenberg was surprised to find that those parts of the body which had been protected in a great degree from the action of light by clothing, were entirely unmarked. Putting this in connection with the fact recorded by Baron Larrey, with which he was doubtless acquainted, that the Egyptians and Arabians were accustomed to cover the exposed parts of small-pox patients with gold leaf, the idea was impressed upon his mind that light was the agent of this phenomenon. Acting upon this impression, he placed a number of patients in an apartment so constructed that the reflected rays of the sun, even at its meridian, could not penetrate therein. The result confirmed his opinion, and fully established the position, that the exclusion of light prevents pitting; for all who were discharged cured, exhibited neither pit nor mark upon the face or body, and even such as had the disease in its worst confluent form, passed rapidly and without any difficulty through the maturative and desiccating stages, and recovered with comparatively none of those marks and disgusting discolorations which so signally disfigure the subjects of this most loathsome disorder. Thus satisfied of the correctness of his conclusion, he communicated the fact in scientific good faith to the class of young men around him, requesting them to prosecute the subject, with

the view of further testing its reliability. One of them made it the subject of a paper, which will be found in the *American Journal of the Medical Sciences*, for 1832, and thus attracted the attention of European physicians to the subject, as may be seen in the *Revue Médicale*, for August, of the same year. Much acrimonious disputation transpired as to who was the actual discoverer of this method; at which we need not be surprised, when we remember the old adage, that "there is nothing new under the sun." Our own Physick was almost shorn of the éclat of one of his most important surgical discoveries, by Dupuytren and Schmalkalken; and, like him, if Dr. Luzenberg did not first bring into notice the practice of excluding the light in treating variolous disorders, he at all events revived it, and finally got as much credit for it as he deserved; for, continues Dr. Logan, I well remember when I arrived in Paris, soon after, that he was pointed out to me at one of the hospitals, by a French student, as an eminent American physician, who had discovered a new mode of treating small-pox. His reputation soon spread beyond the walls of the Charity Hospital, and a better field was opened for him in private practice, which furnished additional scope for the exertion of all his powers, as well as the gratification of his highest ambition. In March, 1832, he was married to Mrs. Mary Fort, daughter of the late Henry Clement, of New York. By the ample fortune which was at once, with the most exemplary confidence, placed at his disposal, he was raised to a height whence he could look down with pity upon the rivalries and jealousies of the profession, and in the seclusion of a well-stocked library, and all the appliances for study with which he now supplied himself, shut his ears against the hubbub of his assailants. More eager now for the acquisition of knowledge than the accumulation of riches, he did not fall into the fatal error of supposing that the distinction he had already acquired entitled him to repose or indolence. He had learned enough—the most important learning—to be conscious of his comparative ignorance, and looking abroad from this new eminence to which he had urged his way, he felt the overpowering conviction, that what he had already gained bore but a ratio, eternally decreasing, to what was still contained within the ever expanding horizon of knowledge. Thus did he determine to avail himself of his acquisitions in the languages, to collect materials in Europe to erect the superstructure for which he conceived he had but as yet laid the foundation. He accordingly, left New Orleans, accompanied by his family. He went by way of the west, with a view of first acquainting himself with the features of his own country, and sailed from New York for Liverpool. Making excursions through England, Scotland and Ireland, and taking notes of everything remarkable in these interesting countries, especially in the line of his profession; he next passed over into France and spent the ensuing winter in Paris. Here he luxuriated in hospitals, schools of medicine, natural history, and the arts, and with a kind of peripatetic study, enriched his mind with all the valuable discoveries in science and art, for which the capital of France is so famous. Partaking of the same industry which is manifested by the medical, scientific, and literary men at Paris, and which is wholly unknown in this country, he was with the pro-

fessors and students before daylight in the morning with taper in hand, pressing through the crowd at the bedside of the sick and diseased, or assisting at the material clinique of some illustrious professor. Hurrying from one hospital to another, he might be found at a more advanced hour of the day on the benches of the Ecole de Médecine, or at some other of the numerous colleges, academies, or gardens of natural history, hearing, seeing, feeling and comparing all the multiplied and varied sources of spreading knowledge. The day was not long enough. The same enthusiasm carried him by night to the dissecting rooms and operating courses, hardly leaving him time to eat, drink, or sleep. Thus he passed the whole winter in Paris, visiting successively, the Hôtel Dieu, la Charité, la Pitié, and other institutions, going from one master to another, discussing all the opinions, ancient and modern, seeing all the methods, and preparing himself to shed a new lustre upon American medicine. But it was chiefly at the unrivalled clinique of Dupuytren that he passed most of his time. "Who has seen the autocrat of the Hôtel Dieu, in green coat and white apron, treading with measured steps at the head of his crowded class, through the vast *salles* of his surgical empire, with his redoubtable looks and regal dignity, putting bluntly a few questions to each patient as he passes on, so pertinent as to draw forth as prompt a response, without being fascinated by the power and omnipotence of his strong mind? But it was not for this ascendancy and domination that Dr. Luzenberg admired the *chirurgien en chef*; on the contrary, no one condemned more than he did his stern and despotic severity. It was for his wonderful acumen and diagnostic foresight, his oracular decision based upon scientific deduction, and the admiral forecast with which he modified general methods of practice according to particular individual cases, that he yielded to him the homage due to extraordinary merit. He was often heard to say that he would not give one morning's visit to the Hôtel Dieu for one whole year's knowledge that can be got from books. This is a high, but by no means exaggerated estimate. Besides having been a perfect and finished operator, the Baron Dupuytren possessed a talent for clinical instruction that never was and perhaps never can, be equaled. To have seen him give an apparently superficial glance at a patient, one would have believed the case to be a very simple one, or at all events to possess few points of interest; but arrived in the amphitheater, he would overwhelm you with a crowd of interesting circumstances, discuss them with his peculiar method and spirit of order, and expose the perilous intricacies of the case with as much precision and perspicuity as if he had weighed and elaborated them in the silence of his study. So, likewise, when he performed an operation, he showed, after it was over and the patient removed, how thoroughly he had comprehended its diagnostic problem, and deliberated before proceeding to the *dernier resort*, although for all this but a few moments were required. In addition to these brilliant qualities, "the first surgeon of the king" possessed what was still more important in a clinical lecturer—an inexhaustible fund of practical reflections of the highest interest, which a talent for extemporaneous speaking and a command of

words, resulting from his knowledge of the languages, enabled him to impart in a diction so pure and elegant as actually to serve as a lesson in elocution to the students." Dr. Luzenberg expressed with great satisfaction at an incident, which confirmed his opinion of the value and importance of a thorough knowledge of the dead languages, to render a physician's preparatory education complete, and to admit him into the great catholic communion and fellowship of scholars throughout all ages and all nations. It was during one of those unlooked for occurrences in the operating amphitheater, which exemplified all the resources of genius, that M. Dupuytren addressed himself to a German student who had stepped forward from the first bench, directing him how to assist him. The young man hesitated, and replied in Latin that he did not understand the French language. Never disconcerted, M. Dupuytren readily explained himself in Latin, and the brilliant operation was soon concluded. We have thus dwelt upon the splendid qualifications of M. Dupuytren, because he embodied the beau ideal of professional eminence, which Dr. Luzenberg had set up in his own mind for future attainment, in a higher degree than any other of the living surgeons of the day, and presented in his qualities, like the artist in the statue of Praxiteles, the aggregated excellencies of the partial and subordinate, but highly meritorious worth around him. To this standard of excellence he modelled all his future efforts, and worked up to it unceasingly with a pre-determined resolution. Not that it was in the nature of Dr. Luzenberg, gifted as he was with a lofty, independent, and capacious intellect, to seek for and depend upon foreign resources, but in his enthusiastic admiration of M. Dupuytren, he contemplated, like an artist, the nearest approximation to the conception of a standard he had previously formed in his own mind, and which he had assigned to himself as a life-work. After spending five months in Paris, Dr. Luzenberg proceeded on his travels through Europe, visiting most of the principal cities of Germany, Italy, Prussia, Poland, Holland, and the Netherlands, and taking copious notes of the hospitals and everything pertaining to medical science, which he at one time had some idea of publishing, but which incessant demands upon his time and attention afterward prevented. At Göttingen he was much gratified by the attention he received at the hands of the distinguished Langenbeck and Himly, who, it would seem, took special pains to acquaint him with the mode of their university lectures, which are delivered gratuitously at the respective houses of each professor and who, likewise, have their hospitals within their own domiciles. The constitution of these seminaries is such as to permit the professor to deliver as many private courses as he pleases, and charge whatever he thinks fit, or can get. Hence result a subdivision of the branches unheard of in our home economy, and a competition and rivalry among the professors, which exert a wholesome reaction among the pupils. At Cracow he had the satisfaction of meeting with an uncle, who was commander of that portion of the Austrian army stationed in that neighborhood, and who furnished him with a special passport for visiting the wonderful salt mines of Wieliczka. His range of investigation was not limited to

the prosecution of the different branches of medical and chirurgical science, or to attendance at the hospitals and lectures of the most renowned teachers in the world, but to the best acquisitions in medicine he added the study of mineralogy, zoology, botany, and the fine arts; so that when he returned home he brought with him a choice collection of rare and precious specimens, and subsidies in every department of knowledge and art. He returned to New Orleans in the winter of 1834. As soon as it was known that he had resumed his business, patients, speaking the languages of all nations, flocked to him, and he was soon engaged in an extensive and lucrative practice. Such was the general confidence reposed in his skill, that he was frequently sent for from great distances to perform important operations, or to meet consultations; indeed, this latter mode of medical practice formed for the last ten years a large share of his daily avocations. On these occasions his conduct was regulated by the nicest sense of professional etiquette, and the established rule of medical ethics. He was scrupulously careful to say nothing in the presence of the patient or friends which could even in an indirect manner weaken their confidence in the medical attendant. On the contrary, if the physician was a young man of merit or character, he did all in his power to raise him in the estimation of those who employed him. Upon all occasions he was ready to confer freely with his professional brethren on any subject respecting which they desired his advice or counsel, whether in special relation to themselves and their affairs, or to those under their treatment. Prodigious of his knowledge as he was generous with his money, he assisted largely in the education of many who drew freely from the inexhaustible fountain of his instruction; and among the prominent physicians of New Orleans, there are several who owe their position and success to his liberality and bounty. Recognizing in all its bearings the force of the maxim that "every man is a debtor to his profession," he never compromised its dignity by underselling his services, or by competing in the cheapening practice with his younger or less fortunate *confrères*. He always graduated his charges according to the circumstances of the patient and his own valuation of the services he had rendered. Perhaps no contemporary practitioner in the United States ever enjoyed so lucrative a practice, or received larger fees for single cases or operations. To the poor he devoted two hours every day, from 8 to 10 o'clock, at his office, and cheerfully gave them his advice and experience gratuitously. Nor did his charity stop here. Many are the respectable families in that city whose slender circumstances scarcely enabled them to live decently apart from his bounty, and who are now mourning for him as their greatest friend, not only in whatever related to their health, but also to their pecuniary well-being. Gratitude, however, continued his biographer, was not the object which prompted his disinterested kindness, for this was seldom manifested towards him during life. He did good for the gratification and reward which every virtuous action carries with it, and could those persons who form their opinions from appearances or hearsay have been admitted behind the scenes into a nearer and truer view of his real character, they

would, instead of doing him more injustice than they have already done, acknowledge that he was possessed of the kindest and softest emotions of which human nature is susceptible. Many instances might be related, did they not infringe upon the sanctity of professional confidence, of his warmest sympathy with the affliction of others, and of the tenderness he evinced for the suffering of such as were compelled by the force of circumstances to submit to his unyielding knife. The consciousness of the benefit which would result enabled him on these trying occasions to steel his sensibilities into apparent apathy or indifference. Such were the principles and feelings; thus exalted were the ends, the aims and the objects which actuated and guided Dr. Luzenberg through the whole of his professional career. Active and operative in his character, he was unable to restrain from practical application the speculations of his ardent and energetic mind, but was continually devising new schemes for enlarging the sphere of his usefulness and benefiting the community by every means in his power. Before one year had expired after his return from Europe, he built the Franklin Infirmary, now the Luzenberg Hospital, situated on the Champs Elysées road, so that those whose circumstances prevented them from receiving his advice at their dwellings, might, for a comparatively small amount, share equally with the more opulent the benefit of his skill and experience. It was almost as easy, once the visit made, for one possessed of his quick and perspicacious insight into the causation and nature of disease, as well as powers of rapid analysis, to prescribe for fifty patients, when congregated together, as for one. As he foresaw, the sick and suffering gathered soon in considerable numbers to his infirmary, and it has been stated by Dr. J. H. Lewis, who was the first physician associated with him in this enterprise, that, such was Dr. Luzenberg's popularity at this period, there were seldom less than from eighty to a hundred patients at any one time during his residence at the hospital. As already stated, long before his visit to Europe, Dr. Luzenberg had reaped in the vast field of the Charity Hospital a stock of practical knowledge and experience in the treatment of surgical cases, which had already established his fame as an operator of the first order. There remained but few of the recognized procedures of chirurgical art which he had not mastered. An opportunity offered soon after his return to New Orleans for the further display of his surgical attainments. It was in the case of an elderly man suffering with a cancer of the parotid gland, which was much enlarged, as may be seen by a painting taken before the operation. The risk and danger attendant upon such a perfect extirpation of this gland as to preclude the possibility of a recurrence of the disease is well known to the profession. Suffice it to say that the operation was performed in so thorough a manner that the disease never returned, and that the man enjoyed good health for many years afterward. The following account of this operation is translated from the *Gazette Médicale de Paris*, 1834: "A man sixty-two years of age had been affected for twenty years with an enlargement of the parotid gland. About six years prior to this time it began to increase rapidly, and soon acquired the size of a hen's egg; extensive ulceration attacked the sum-

mits of the tumor, from which a thin ichorous pus was discharged, and acute lancinating pains were experienced in the diseased parts; in a word, it manifested all the usual symptoms of a cancerous affection. Dr. Luzenberg resolved to extirpate this tumor, and commenced by passing beneath the primitive carotid artery a loose temporary ligature; then, after having circumscribed the cancerous mass by two incisions, he detached it from the deep-seated parts, extending the dissection to so great a depth that both the styloid and mastoid apophyses were fully exposed to view. At this stage of the operation it was easy to see that the entire parotid gland had degenerated into an encephaloid substance. The profuse hemorrhage which supervened towards the close of the operation rendered it necessary to tighten the ligature which had been cast around the common carotid artery during the first steps of the operation; this promptly arrested the flow of blood." The next operation, which may be called the capital of his surgical pillar, was the excision of six inches of the ileum. This was a case of strangulated hernia in a man, treated jointly by Dr. Lewis and Dr. Luzenberg. Dr. Lewis states that when they cut down to the sac, the intestine was found so completely mortified for the extent of at least half a foot as to yield under the touch. With his peculiar quick and comprehensive judgment, which enabled him to determine instantly the merits of a procedure, when most men would be still hesitating as to what ought to be done, Dr. Luzenberg proceeded, with the assistance and concurrence of Dr. Lewis, to remove all the mortified portion of the gut, and to bring the serous surfaces of the separated ends together by means of stitches, after the manner recommended by Prof. Gross, of Philadelphia. The patient was put upon opium treatment, and in thirty-five days the stitches came away and he entirely recovered, and afterwards remained in good health for more than thirty years. The next triumph in surgery of Dr. Luzenberg was the tying of the primitive iliac artery for the cure of an aneurism of the external iliac. The subject was a mulatto man, about eighteen or twenty years of age, who bore the operation well. The ligature came away in twenty-one days, the anastomotic circulation was gradually established, the tumor became absorbed in due time, and the patient, when last seen many years afterward, was well and hearty. It would swell the pages of this memoir to an unnecessary extent to detail all those multiplied and varied achievements of his knife, which proved a surgical genius, not only in expertness of execution, but in the invention of modes of operation. There is one class of operations, however, in which Dr. Luzenberg took particular interest, and that was couching for the cataract. Whether it was that he possessed a peculiar tact in the use of the needle, or that he exercised a rare faculty of prognosis in the cases he undertook, it is certain he seldom, if ever, failed in producing, if not a complete, at least a partial restoration of vision. Many are the once blind in New Orleans who owe to him the recovery of their visual powers after years of obscurity. There is one case in particular, which was published in the journals of the day, of an individual who, after a total eclipse of light for eight years, caused by cataract, was in the space of one minute re-

possessed of the full enjoyment of a sense, the loss of which is in itself one of the most dreadful misfortunes that can befall humanity. No sooner was his Infirmary established on a permanent basis than Dr. Luzenberg hastened to accomplish his cherished idea of instituting a medical school. As he was at this period extensively known and appreciated, not only by the members of his own profession, but also by all who cultivated science in general, and enjoying, as he likewise did, the friendship of the Governor of the State, he had no difficulty at first in carrying out his plans. His colleagues in this enterprise entered upon the preliminary arrangements with similar views, no doubt entertained simultaneously with himself, and from their combined exertions and influence arose the Medical College of Louisiana. Dr. Luzenberg was chosen dean, and the first session opened with a class of sixteen matriculated students. The lectures were delivered in the State House, on Canal street, and the anatomical demonstrations at the Charity Hospital. The chair of Anatomy was filled *ad interim*, as well as that of Surgery, of which he was Professor, by Dr. Luzenberg, with his well-known ability and accustomed zeal. Dr. Luzenberg is said to have been a superior lecturer, and on all occasions exhibited great powers of reasoning, joined to the charm of a fluent and energetic elocution. "In his various discussions before the Medico-Chirurgical Society of Louisiana, he was remarkable for great copiousness of language, and that delicate tact which is appositely resorted to by men of varied learning and distinguished social relations in keeping up the interest of their hearers." Untiring in his devotion to every subject connected with his profession, as well as to the medical institutions of the State, and ever active in alleviating the sufferings of humanity, we find him next taking a deep interest in the regulation and internal management of the Charity Hospital, of which he was appointed one of the administrators by the Legislature. He was elected vice-president of the institution—in fact, virtually president, the Governor being *ex-officio* nominally so; an office which he continued to fill with zeal and fidelity during the remainder of his life. It would have been an impossibility for a thoughtful and energetic man like Dr. Luzenberg, who had consecrated to learning the passion of his youth and the strength of his manhood, and had made even the portion of his life when he traveled a period of more diligent application, now, when his feelings had become regulated by the discipline of philosophy and his opinions mellowed by meditation and experience, to abstain, so long as the welfare of humanity was the object of his pursuits, from turning to practical purposes the results of his intellectual acquirements, and thus contributing to the interest nearest to his heart. The repeated recurrence of yellow fever in New Orleans, and the confused and imperfect accounts published concerning a disease of which so little positive knowledge was as yet established, determined him to make its investigation the subject of a publication which should be as perfect as the most diligent application of the residue of his natural allotment of life could make it. Accordingly he set himself to work collecting materials for this object, and perhaps there exists no book in any of the languages, having the most remote bear-

ing on yellow fever, which he did not procure. His plan was to have large and accurate plates of every phasis of the disease, somewhat after the manner of M. Pariset, and he had already caused to be painted in oil, as large as life, the most accurate delineations of the *facies* and other morbid appearances which are so readily recognized as pathognomonic of yellow fever. His writings and pathological researches on the subject had reached a voluminous extent at the time of his decease, but still it was far from being completed, nor did he contemplate publishing the work until he had established every fact and assertion to his satisfaction. With his peculiar predilection for the Latin language, the manuscript is in that tongue, but whether he intended to publish it in such classic form is not known to any one. Never satisfied unless he was incessantly occupied in prosecuting measures which appeared to him best fitted to promote the cultivation of those branches of human knowledge so necessary for the intellectual improvement of society as well as the progression of his profession in the collateral sciences, we find him, in 1839, becoming the founder of the "Society of Natural History and the Sciences," which was liberally endowed by the Legislature, with full power to create professorships and confer degrees. To the advancement of this institution, of which he was forthwith elected President, he devoted every hour that he could spare from other avocations, or snatch from the time allotted to sleep; and to forward the great objects in view, he was always ready to sacrifice the claims of worldly prudence and self-interest. The rich collection of specimens in natural history and the natural sciences which he has left behind him attests his munificence and disinterested exertions in the cause of education. Believing in the principle of association, so characteristic of our republic, and so potent an agent in the diffusion, as well as in the augmentation, of knowledge, Dr. Luzenberg, succeeded at last in consummating a long-projected scheme for uniting his medical friends of the city into a society for the purpose of mutual improvement and the promotion of medical science. In 1843, a legislative act was passed, incorporating this organization under the title of The Louisiana Medico-Chirurgical Society, and at its first meeting Dr. Luzenberg was unanimously chosen president. In the midst of his active life Dr. Luzenberg's health began to fail suddenly. Although for a considerable time previously he had experienced the most undoubted symptoms of cardiac disease, still he did not suffer to any noticeable degree until about the beginning of the spring of 1848, when actual pain in the præcordial region, together with obstinate and readily excited paroxysms of palpitation and dyspnoea, totally incapacitated him from application to any business whatever. The worst fears of his medical friends were now excited, and their diagnosis confirmed, with an accuracy worthy of the school of Corvisart, by M. Rouanet, of France, recently arrived in New Orleans, who, as was verified by the autopsy, pointed out the precise location and character of the disease. Without any expectation of deriving benefit from travelling or other means, but solely with the view of escaping from the unavoidable molestations incidental to his numerous business relations, Dr. Luzenberg, after experi-

encing some degree of alleviation from the quiet of a seashore residence, determined at the first approach of summer to sequester himself at the Red Sulphur Springs of Virginia. By the time he reached Cincinnati, however, his malady had made such inroads upon his constitution that he could proceed no further, and here he lingered until death terminated the suffering and the earthly career of one of the most brilliant members of the medical profession that this country has yet produced. The obsequies were performed on the day after the arrival of his remains at New Orleans; and the large concourse of sympathizing friends and acquaintances, who attended and followed on foot to his last resting-place, in the Protestant Cemetery, showed the high and general estimation in which he was held. The Philharmonic Society, of which he was president, appeared in a body as the procession was moving off, and accompanied it, unexpectedly to every one, with strains of the most appropriate and solemn music. But the most affecting part of the ceremony was to witness the children of the Protestant Female Orphan Asylum, to which he had been a number of years the physician, following in the wake, uniformed in the habiliments of mourning. Truly touching was it to observe this testimonial of the fatherless and afflicted to their departed benefactor, which spoke more eloquently than the best-couched eulogy. During the time occupied in closing up the tomb, appropriate addresses were made to suit the mixed multitude assembled, in the French, English, and German languages.

G. Frank Lydston

LYDSTON, G. Frank, of Chicago, Ill., was born in Jacksonville, Tuolumne county, Cal., March 3, 1857, his parents being among the pioneers

of 1849. He is of Scotch-English descent, his ancestors having been among the earliest settlers of New England. He was a student under Dr. F. B. Norcom and Prof. Joseph W. Howe, of New York, both of whom are recently deceased. He graduated at Bellevue Hospital Medical College in 1879, and was soon after awarded the highest mark in the competitive examination for the New York Charity Hospital. He served eighteen months in this institution, after which he was appointed resident surgeon to the State Immigrant Hospital, at Ward's Island, N. Y. In 1881, he resigned the latter position, and went to Chicago to practice his profession. For seven years he held the lectureship on genito-urinary and venereal diseases in the Chicago College of Physicians and Surgeons. He was appointed to the full professorship in this institution in June, 1891. Dr. Lydston is well known as a writer on scientific topics and as a teacher, and is rated as one of the most successful practitioners in Chicago, having built up a very large and select clientele. His practice is limited to office and surgical practice, much of his time being devoted to genito-urinary surgery and syphilology. Dr. Lydston's contributions to medical literature number over one hundred papers and books, upon a wide range of topics. His first paper, published in 1880, was on "Anomalous Origin of the Descendens Noni." Among his most important papers and monographs since published are: "Lectures on Syphilis," 1884; "A Treatise on Varicocele," "A Treatise on Gonorrhea," "A Monograph on Stricture of the Urethra," 1892; and essays entitled: "The Surgical Treatment of Peritonitis," "Sexual Perversion," "Studies of Criminal Crania," "Tropho-Neurosis in its Relations to the Phenomena of Syphilis," "Aberrant Sexual Differentiation," "Evolution of the Infectious Diseases," "Observations on Urethral Stricture," "Gonorrhœa in the Female," "Materialism vs. Sentiment in the Study of Crime," "Syphilis in its Relations to the Repair of Wounds," "Chronic Ulceration of the Female Genitalia," "The Rationale of Extension in Diseases of the Spinal Cord," "The Physiological Action of Heat and Cold." For many years Dr. Lydston has been associate editor of the *Western Medical Reporter*, his editorial writing being of a characteristically independent and progressive character.

LYMAN, Charles B., of Denver, Colo., son of Dr. J. B. Lyman, of Salem, Mass., was born in Rockford, Ill., September 20, 1863. When he had reached the age of seventeen years his father moved to Salem, Mass., at which place he received his preliminary education consisting of a preparatory college course. At the age of nineteen he entered the medical department of Harvard University, Boston, at which institution he spent four years, graduating in 1886, with the degree of M. D. "*cum laude*," with the highest standing in his class, and at the same time being the youngest member of his class. Soon after graduation he went to Denver, Colo., to accept a position as surgeon to the Union Pacific Railway at that point, which position he has held since that time; although only twenty-nine years of age he has attained a prominent position amongst the surgeons of Colorado, especially in the line of railway surgery. In 1887 he was appointed instructor

C. B. Lyman.

in physiology in the medical department of Denver University, in 1890 he gave up that position to take a similar one on fractures and dislocations, which position he has since held; he holds the following hospital positions:—Genito-Urinary Surgeon to the Deaconesses Home Hospital, Surgeon to St. Luke's, St. Joseph's, and the Union Pacific Railway Hospitals; he is a member of the local and State societies and the American Association of Railway Surgeons; also the Denver Clinical and Pathological Society. His writings have been confined to reports from time to time of interesting surgical cases.

McBURNIE, Charles, of New York City, was born February 17, 1845, at Roxbury, Mass. He received his preparation for college in the private schools of Boston, entered Harvard with the class of 1866, being graduated in due course and receiving therefrom the degrees of A. B. and A. M. He removed at once to New York for the study of medicine in the College of Physicians and Surgeons, now a department in Columbia College. He occupies the Chair of Surgery in this institution which is, perhaps, one of the most highly esteemed professional honors in the American medical world. In addition to this he is sole attending surgeon to Roosevelt Hospital. He is also consulting surgeon to St. Luke's, the Presbyterian and Orthopedic Hospitals. He is a prominent member of the Union League, University, Century and Harvard clubs, and is widely known as a distinguished and successful surgeon.

McCALL, Joseph W., of Huntington, Tenn., was born in Henderson county, that State, January 20, 1832. He attended the medical department of the University of Nashville and received the degree of M. D. from that institution in 1857. His medical education and

training were supplemented by attending the College of Physicians and Surgeons, New York, and the medical department of Vanderbilt University, receiving his *ad eundem* degree from the former institution in 1869, and from the latter in 1882. An honorary degree was also conferred upon him by the medical department of the University of Tennessee in 1883. He served in the war of the Rebellion as acting assistant surgeon from October, 1862, till March, 1864. He was in the skirmish at Lexington, Tenn., at the time of the capture of Col. R. G. Ingersoll, December 10, 1862, and was stationed at Trenton, Salsberry, Union City and at Grand Junction, Tenn. His literary contributions consists of important cases occurring in his own practice, among which may be mentioned: "Report of a Case of Rupture of the Uterus and Escape of the Child and Placenta into the Cavity of the Abdomen and Removal by Gastrotomy," *Nashville Journal of Medicine and Surgery*, 1873; "Report of Seven Cases of Trichinosis in One Family and their Successful Treatment," *State Board of Health Bulletin*, 1891. Dr. McCall has also written an interesting article entitled, "The Reasonable Theory of Malaria," which was published in 1878. Dr. McCall has been an examining surgeon for pensions since 1866, and is president of the United States Examining Board of Surgeons at Huntington. He has been engaged in a constant and successful practice of medicine and surgery for thirty-six years. He is ex-president of Carroll County Medical Society, and is recognized as one of the most prominent members of the profession in that section of his State.

MCCASKEY, G. W., of Fort Wayne, Ind., was born in Delta, Fulton county, O., November 9, 1853. His parents resided on a farm, where he spent his early life, with such educational advantages as were afforded by the "district school." He received the degree of M. D., from Jefferson Medical College, Philadelphia, Pa., in 1877, and the degree of A. M. (in course), from De Pauw University, after having, as a non-resident student, pursued a full course of study, and passed his examinations for the Bachelor's Degree, subsequent to his graduation at Jefferson. After practicing three years in Cecil, O., he spent a portion of the year 1880 studying in Europe, following which he began practicing his profession in Fort Wayne, where he has since pursued a successful career. At the time of his removal to Fort Wayne, he occupied the chair of Physiology and Clinical Medicine, in the Fort Wayne College of Medicine, which he filled for several years, until he was transferred to the chair of Theory and Practice of Medicine and Clinical Diseases of the Chest and Nervous System, the duties of which he now discharges. He has contributed some twenty-five papers to the various medical journals of the country, the subjects covering a very wide range of medical thought and discussion. For several years past, however, his contributions to current literature, as well as his clinical instruction, have been largely in the field of nervous diseases. These comprise within the last year, for instance: "Cerebral Thrombosis," with report of three cases; "Some Remarks on the Pathology and Treatment of Epilepsy;" "The Recognition and Treatment of the Simpler Forms of Neuritis;" "Report and Discussion of a Case of Persistent Masticatory Spasm;" "Hemianopsia as a Di-

G. W. McCaskey.

agnostic Sign of Brain Disease;" and the "Importance of the Early Diagnosis of Spinal Cord Disease." He enjoys among his colleagues an extensive reputation as a general diagnostician, more especially in the domain of nervous disease. He has been at different times president of the Fort Wayne Academy of Medicine, Fort Wayne Microscopical Society, and Allen County Medical Society; and is, in addition, now a member of the Indiana State Medical Society, American Academy of Medicine, American Medical Association, American Psycial Society, and American Academy of Political and Social Science.

MCCLELLAN, George, of Philadelphia, Pa., was born at Woodstock, Windham county, Conn., December 23, 1796, and died in the former city May 9, 1847. From a memoir prepared by his son, Dr. J. H. B. McClellan, we glean the following interesting details concerning the achievements of one of the most extraordinary surgeons that this country has ever produced: He was descended from an old Scottish family, who had emigrated to this country at an early period, from Kirkcudbright, Galloway, Scotland, where they had taken an active part in all the wars, both civil and foreign, of their native land, from the days of William Wallace down. His family had mostly remained for several generations in the town where he was born, and many of its members had been engaged in the war of the Revolution with considerable distinction. His early education was obtained from the academy of his native town; one of those New England schools which, although at that time embracing but a limited scope in their studies, were thorough in their teaching, and have been the foundation of the career of many of our ripest scholars and most distinguished men. Here he derived a thorough training in the rudiments of Latin, Greek, and mathematics. At the early age of sixteen, in the year 1812, he entered the Sophomore class of Yale College, New Haven, at that time under

the presidency of Dr. Dwight. His collegiate life was marked by singular quickness of perception, readiness in the acquisition of knowledge, and an enthusiastic but immethodical devotion to his studies. His talent particularly displayed itself in mathematics and the languages; in the former he showed proficiency, while in the latter his attainments were far above mediocrity. He also manifested a fondness for the natural sciences, and his zeal and success in their cultivation are favorably recorded in the early numbers of the *American Journal of Science*. Whilst at college, becoming much attached to the celebrated Professor Silliman, he formed a close friendship and intimacy with him which lasted through life. Through his influence he was attracted to the above mentioned studies, more especially botany, mineralogy, and geology, which he cultivated by reading with extreme fondness, even during the busiest portions of his after professional career. In 1815, he obtained his academical degree, with a high reputation for knowledge in certain branches, and for the remarkable vigor and quickness of intellect which he had evinced. He immediately afterwards commenced the study of medicine in the office of the late Dr. Thomas Hubbard, of Pomfret, near Woodstock, who subsequently became Professor of Surgery in the Medical College at New Haven. In 1817 he came to Philadelphia to attend the lectures in the University of Pennsylvania, at that time the only medical school in that city. Here he entered the office of Dr. Dorsey, Professor of Materia Medica and Anatomy in the university, as a private pupil, and remained with him until his early and lamented death, in 1818. "Here again," to use the words of his distinguished friend, Dr. Samuel G. Morton, "his restless activity and sleepless vigilance in the pursuit of knowledge, were remarked and admired by all; exciting the surprise of his fellow-students, and drawing from older heads the presage of future distinction." In 1818, a year before his graduation, he was elected resident physician to the hospital of the Philadelphia Almshouse, and whilst there showed the most enthusiastic devotion and application to the study of medicine and surgery. Perhaps few men ever laid a better or more thorough foundation for a future successful career than did Dr. McClellan during the period of his pupilage; working day and night in the dissecting-room, taking notes of all the lectures, reading with avidity and with patience all important books within his reach, he stored up knowledge which, in the rapid accession of private practice that soon attended him—besides the habit of study and close application,—was of the utmost importance, and aided, perhaps as much as his superior intellect, to hurry him at an early age into the successful business of his profession. That there is "no royal road to knowledge," was clearly exemplified in his early preparation. The copious note-books collated whilst in his collegiate course at Yale, and in the lecture-rooms and hospitals, as well as in the earlier years of his private practice, evinced the painstaking and patient labor of many years, which few, who were only acquainted with his busy, active habits, and mercurial disposition in later life, could appreciate. "Here," quoting from the excellent memoir written by Dr. W. Darrach, who was a fellow-resident at the hos-

pital with him, "ever advancing in medical knowledge and ever communicating, he became our daily mental stimulus. His unrivalled unison of eye and hand has been mentioned; with equal truth. I notice also his equally remarkable unison of a rapid mind and tongue. Neither at his meals, nor in his bed, can I recall to mind McClellan. My associations of him relate to his rapid walkings; rapid and constant talkings; his perpetual prescribings, manipulatings, experimentings; his autopsies and operations rapid; rapidly at it, and always at it! Book after book on medicine he constantly and rapidly read, and clearly and pleasantly detailed, making us listen to him. He provoked us to physiological experiments. Each corpse in the dead-house was marked by his autopsy and surgical operations. Thus he sometimes made trouble, easily quieted though, for the people even then seemed intuitively to know that McClellan was appointed to be their head doctor, in spite of all the great doctors; and they let McClellan do anything. In surgical matters he was ever active, testing and trying whatever he had read or heard of. On one occasion, I well remember, that while reading, he jumped from his chair, and exclaimed, 'Mott, of New York, it is said, has taken up the innominate for aneurism, and I believe it.' Having immediately afterward left us a while and then returned, he exultingly exclaimed, 'I've done it!' He had gone to the dead-house and there imitated Mott's operation on the subject. Such in 1818-19, at the age of twenty-two years, was the deportment of McClellan in the Philadelphia Almshouse." In the year 1820 he married into an influential family of Philadelphia, and had already become established as a practitioner. During the very first year of his practice he performed many of the most important operations in surgery, such as lithotomy, extraction of the lens for cataract, and extirpation of the lower jaw. He opened a dissecting-room and gave private courses of lectures, both on anatomy and surgery, displaying that same vivacity of manner which characterized him through life, and he became an attraction to medical students. His attentive class consequently became very soon so numerous as to require for their accommodation a larger room. His more public career as a lecturer began in 1826, when he founded the Jefferson Medical College, of his connection with which, and with the different medical schools of Philadelphia, his biography, written by the late Dr. S. G. Morton, his colleague for many years, and to the time of his death his most valued and intimate friend, may here be quoted: After having given a private course of anatomical lectures, Dr. McClellan conceived the bold idea of founding a new medical school. With him, thought and action were simultaneous; a memorial was addressed by himself and others to the Legislature of Pennsylvania, and a charter was obtained in the winter of 1825 for the Jefferson Medical College. Says Morton, from a personal knowledge of the time and circumstances, no professional innovation was ever more unfavorably received by the physicians of Philadelphia than this. It had a direct tendency to isolate its author, and certainly influenced his destiny throughout life. It was assumed and asserted that there was not patronage for the support of two schools,

and that the new one could only succeed at the expense of its elder rival. And, inasmuch as the whole scheme was regarded as a professional heresy, it need not be added that its partisans met with no favor. Dr. McClellan reasoned differently; he maintained that students would flock to that city in numbers proportioned to the increased facilities for education, and that each institution might be amply supported without any conflict of interest. The result verified his prediction. In place of five hundred students, which was the maximum number before this competition was organized, Philadelphia now enrolls annually more than a thousand, embracing a portion of the genius and talent of every State of the Union. It is important, however, to observe that, owing to the general disapproval of the plan of a new college, Dr. McClellan met with great difficulty in organizing a medical faculty, and his colleagues were unavoidably chosen from among men greatly inferior in talent to himself. Incongruous elements were thus associated together; dissensions arose, and disunion followed. Yet, notwithstanding all these adverse circumstances, Dr. McClellan had the satisfaction, in the year 1836, to welcome no less than three hundred and sixty pupils into the school he had founded. Dr. McClellan's lectureship was Surgery, and he continued his instructions in this branch until the year 1838, when, for reasons unknown to his biographer, the professorships of Jefferson College were all vacated, by a decision of the Board of Trustees, and a new organization took place, from which Dr. McClellan's name was excluded. This new faculty was composed of men of distinguished attainments. The medical public acquiesced in the change; Jefferson College was received into favor, and collegiate competition was legitimized. So true is the adage that times change and we change with them: "*Tempora mutantur et nos mutantur cum illis.*" Mortified, but not discomfited, by this adverse issue of his cherished plans, Dr. McClellan immediately conceived the project of a third medical school, and with characteristic buoyancy of spirit and determination of purpose, he went in person, accompanied by a single professional friend, to solicit a charter from the State Legislature. Corporate privileges were, in consequence, granted to an institution entitled "The Medical Department of Pennsylvania College," at Gettysburg, and McClellan, with five associates, commenced the initiatory course of lectures in Philadelphia, in November, 1839. This institution had an auspicious beginning, in a class of nearly one hundred pupils, between which number as a maximum, and eighty as a minimum, it continued under the direction of the same faculty for four consecutive years. Notwithstanding this seeming prosperity, it is due to Dr. McClellan's memory to state that some injudicious pecuniary arrangements, entered into in the first instance, and in which he had no part, tended to embarrass the institution through the entire period of its existence. The sinister effect of these arrangements was soon felt by all concerned, and nothing but a mutual sense of honor sustained the faculty in combined execution during the four annual courses of lectures, the last of which terminated in the spring of 1843. Soon after this date the entire faculty resigned their professorships into the hands of the trustees. The mo-

tive that influenced a part of these gentlemen in taking this step may be inferred from the preceding statement; other members were influenced, at least in degree, by other considerations. It may, perhaps, be safely asserted that Dr. McClellan was the only member of the faculty who reluctantly abandoned this his last and cherished enterprise. His zeal and enthusiasm could see nothing but success in the future, and he never abandoned the conviction that further perseverance would have been crowned with commensurate reward. Though, as remarked by Dr. Morton, "he lived to experience the proverbial misfortune of most pioneers and discoverers, who sow the seed of which others reap the reward," it is still a great satisfaction to those who early sympathized with him in his exertions, and still survive, to see the success of the first institution he founded, amidst the difficulties and conflicts of the complications of the times. The Jefferson Medical College now enjoys the first rank among the medical schools of this or any other county. In fact, for Dr. McClellan may be claimed the sole authorship of the extended system of medical education as it now exists in this country. The clinical instruction of the colleges was originated by him, and the many schools in the different sections of our Union derive their origin from the impetus given by him. Whilst here summing up his career as a public teacher, one of his biographers alludes to his peculiar style of lecturing, which he describes as purely extemporaneous, not what is usually called so, reciting matter previously committed to memory, but he *thought aloud*; his mind, well stored with the subject and trained by early classical education and logical deduction, expressed itself in a natural manner and diction, which has never been excelled. Utterly unconscious of those around him, giving himself up to the subject before him, his lectures achieved a popularity and produced an effect seldom equalled. He was remarkable for exuberance of thought, and this attribute was responded to by corresponding volubility of speech. In lecturing, or in conversation, he was never at a loss for words; yet, in spite of this amazing fluency, his ideas manifestly accumulated more rapidly than the tongue could give them utterance. During the latter part of Dr. McClellan's life, he obtained one of the largest practices known in the country; his name had extended to the Old World, and on this continent he attracted patients from all parts of our Union, and the West Indies and South America. Few men in private practice have operated so frequently. His list included almost every capital operation known to surgeons, together with others that were original with himself; and these multiplied efforts of his genius were rewarded with a full share of success. In ophthalmic surgery he was particularly eminent. The number of his operations for cataract, and other diseases of the eye, was remarkable, and for extraction of the lens he was very successful, and among the first to introduce it here. Many of the operations in surgery, which are now quite common, were not employed in this country in the earlier period of his practice; and he shared with Mott, of New York, and Warren, of Boston, the credit of establishing many procedures new on this side of the Atlantic. He performed lithotomy nearly fifty

times with great success, mainly by the lateral operation, and was one of the first to use the high or supra-pubic method here. Lithotripsy was also performed by him in very many cases. As early as 1823, he amputated the body of the lower jaw, an operation which was afterwards repeated by him many times, as well as disarticulation from either side. The upper maxillary along with the malar, and a portion of the external angular process of the frontal bone, including the lachrymal gland, was removed by him prior to Mr. Lizars's operation, and subsequently he exsected the bone in other cases, even involving a greater extent of structure. The extirpation of the parotid gland, so long a mooted point and source of serious contention among surgeons, was performed by him several times, most of which were successful, as will be seen by the following quotation of a note by the editor of his surgery: It may not be amiss here to claim for the author the credit of having done more than any other surgeon, by the number and success of his operations, to establish completely, as safe and feasible, the extirpation of the parotid gland. In tracing back the records of surgery, we find, prior to his first operation, in 1826, several isolated cases, which prove that among the earlier surgeons, even as far back as the celebrated Heister, of whom Borden, in his "Researches" on the glands, remarks, in speaking of the parotid, there were some bold enough to attempt this really formidable operation, and to consider its successful execution not only within the bounds of probability, but of reason and security. Still, at that period, their authenticity was not only questioned by the majority of the profession, but the many dangerous anatomical obstacles involved, as well as the deep and almost inaccessible situation of the gland, rendered its removal at least so serious an undertaking that it was laid down by most authors as extremely hazardous, and even characterized, in the strong language of John Bell, as "impossible and absurd." The case of Beclard, only a year or two before, having terminated fatally, did much at that time to prejudice opinion against the operation. Cases which have since been reported as having been performed previously, but not then made known; and, on the whole, as regards boldness in entering upon a new and scarcely explored field of surgery, the first case of Dr. McClellan may be considered as almost an original one. There was then no record of the difficulties and complications of this operation; nothing laid down to guide the adventurer as to the dangers likely to be met with in his progress through an untried region; and the very first case undertaken by him had been previously attempted and given up by eminent surgeons abroad. The accumulated experience of European and American surgeons has now, however, completely demonstrated its practicability, and we may safely place it among the standard and established operations of surgery. The parotid gland has now been repeatedly removed by various surgeons, but no one has done so much to effect the change of opinion regarding the operation as Dr. McClellan. He extirpated eleven entire parotids, in various conditions of organic disease, and only one of his patients died in consequence of the operation; that one sank under coma on the fourth day after the opera-

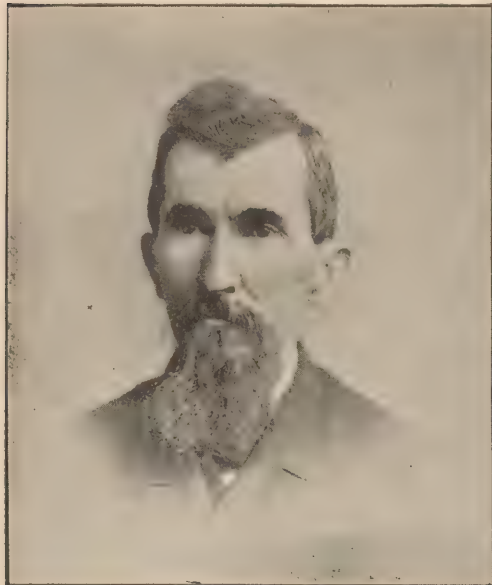

tion, from the effect of the ligature around the common carotid artery. The other ten patients recovered, and seven of them were alive and well at the time of his death. Only one of these died from a return of the disease in the same part three years after recovery from the operation. His operation for exsection of the ribs was, at the time of its performance, novel. In 1838, he removed successfully, on account of an encephaloid cancer, the whole of the upper extremity, including the scapula and clavicle, with success; an operation which was never attempted before or since, save once by Dr. Gilbert, in a less degree. Indeed, his scope in surgery extended as far as that of any man who had gone before him, and beyond others of his own time, embracing every species of operative procedure, repeated again and again with remarkable success. Nature and early education had eminently fitted him for an operative surgeon, and his thorough knowledge of anatomy led him to attempt without hesitation many things from which others would recoil. Every cut of the knife was made with a confidence that could only result from positive knowledge. With regard to his editorial labors, Dr. Morton says: "Dr. McClellan's excellent classical education was blended with a continued fondness for literary pursuits, and a lively interest in general science. He read much, but wrote little. He always took up his pen with reluctance; and it was only at the earnest and long-continued promptings of his friends that he at length commenced his 'Principles of Surgery.' The first printed sheet was placed before him during his brief illness, but he was already too much exhausted to notice its contents. The work, however, has been ably edited by his son, and it is now before the world an abiding memorial of the skill and genius of its author. Novelty in practice is not the test of excellence or superiority in either surgery or medicine. The annals of our profession are full of proofs of the truth of this axiom. Dr. McClellan made no parade of originality; but he set forth, with the hand of a master, the multiplied experience of more than a quarter of a century; and this experience was, no doubt, as extensive as that of any private practitioner among us during that long period of professional toil. Skill, decision, and promptness were in him remarkably conspicuous, and they were combined with a judgment that had become matured in the school of observation and reflection. In the 'Principles of Surgery' we find no temporizing treatment, no timid practice, but the positive knowledge of a mind that knew and relied upon its own resources. In earlier years he was a contributor of original papers to different medical periodicals, and was one of the conductors of the *American Medical Review and Journal*; he subsequently edited an edition of 'Eberle's Theory and Practice of Physic,' with notes and additions. His work on surgery was only commenced within the last few months of his life. The constant interference of a large practice prevented him from writing, except at uncertain and irregular intervals. Many of its pages were penned whilst suffering acutely from disease; and relief from pain was often sought by occupying his mind with the work. As if forewarned by some indefinite impression that he might not be spared to carry out his entire object, he seemed bent upon hastily finishing

what was meant to be the first volume, and its earlier pages were actually passing through the hands of the printer whilst he was preparing the closing ones. Suddenly cut off in the midst of his labors, the work was necessarily incomplete." Beside his surgical labors and his literary efforts, as is usual in this country, where no one can devote himself entirely to surgery, his medical practice was large, and perhaps he prided himself as much upon it as upon his operations. Thoroughly acquainted with all the theories of the times, he acted from the principles of common sense, the old Baconian system of deduction, which he always advocated in his lectures. To exemplify this, in a valedictory address delivered by him to the graduating class of Jefferson Medical College, in 1836, he says: "In regard to the best mode of cultivating your profession, I shall have time to say but a few words. Recollect what I have so often, and so constantly urged on your attention, respecting the rules of inductive science. Be always governed by the observation of symptoms, and not by the imaginary causes of them. The whole science of nature consists in the classification of phenomena. We can do but very little in the way of theory, and nothing in the way of hypothesis. Be content, I beg of you, to follow the dictates of common sense in all cases and under all circumstances. Be satisfied with the opinions you can form from a plain and careful examination of the indications which nature holds up to your view; and reject all inquiry into the secret and undefinable causes of life and disease. You can not imagine the advantages which you will gain by such a course of practice, over those who are governed by the long-explored precepts of the schoolmen—revived and repolished, as it must be confessed they have been, by the innovators of France. While they are balancing doubts and difficulties, and vibrating from one conjecture to another, you will be fortified by the calm and unchangeable dictates of sound reason and philosophy." The remaining portion of Dr. McClellan's life, after he retired from lecturing, was spent in the active duties of his profession. For some years he was afflicted with neuralgia, commencing on one side of the head, which afterwards extended throughout all his limbs and body; but he bore it with singular fortitude, and would not allow it to interfere with his daily duties. Some men live in months or weeks what would be to others as years. Time will not measure the actions and deeds of men; and the subject of this memoir was one of those who in unceasing activity, wore out the vital forces, which in others would have lasted to a period far beyond the age at which he died. Referring to this sad event his son, Dr. McClellan, has written as follows: His final illness was severe; his death sudden. On the morning of the 8th of May, 1847, he assisted in the performance of two surgical operations. He came home soon after noon, complaining of indigestion, which was quickly followed by symptoms analogous to those of bilious colic. These increased every moment in severity. Medicines at length afforded some mitigation of his sufferings, and for a short time, gave promise of relief; but it was presently observed that, as his pain abated, exhaustion and restlessness followed. These symptoms increased towards evening, and at eleven o'clock at

night, to the surprise and dismay of his family and friends, the hand of death was evidently upon him. His mind continued clear, but his articulation became hurried and indistinct. At midnight he was pulseless, and soon afterwards fell asleep; and in this state of unconscious tranquility he died, at half-past one o'clock the same night, in the fifty-first year of his age. At a *post-mortem* examination, ulceration of the mucous coat of the bowels was discovered, and a perforation, a few inches below the sigmoid flexure of the colon, as the immediate cause of his sudden death. Few men have had warmer and more attached friends; and many more interesting instances of his close intimacy with the distinguished men of his time might be detailed. He possessed a sensitive and generous spirit, blended with a confiding manner, that strongly marked his intercourse with men. His feelings were quickly excited and warmly expressed at the sense of unkindness or injustice; but there was a magnanimity in his nature that readily forgave an injury. Ever ready to afford assistance, whether professional or otherwise, with generous impulses and forgetful of self he attracted the most unbounded popularity among the poorer classes, as evinced by their strong manifestation of respect at the time of his death. His name is still a household word among them. Two sons survived him. The eldest, Dr. John H. B. McClellan, was born in Philadelphia in 1823, and died in Edinburgh, Scotland, in 1874. He graduated in medicine at the University of Pennsylvania in 1844, became Professor of Anatomy in the medical department of the Pennsylvania College in 1855; surgeon to St. Joseph Hospital and Wills Eye Hospital for many years, and during the Civil War was connected with South Street Hospital, and afterwards acting assistant surgeon at Mowers Hospital, where he performed many notable operations of which accounts are given in the Medical and Surgical History of the Rebellion. It is said that he inherited much of his father's quickness, and that his skill in diagnosis of disease was almost intuitive, while his extreme delicacy of feeling and genial nature made him a welcome visitor in the sick-room. The second son, the late General George B. McClellan, born in 1826, the year his father began his public lectures as Professor of Surgery in Jefferson Medical College, who afterwards became the illustrious Commander of the United States Army during the Rebellion, died in Orange, N. J., in 1885. Dr. Samuel McClellan, who aided in founding the Jefferson Medical College, afterwards Professor of Anatomy and Obstetrics in that institution, was a brother of Dr. George McClellan, and who was associated with him in practice, particularly in ophthalmic surgery, died in 1853. He also left two sons. The eldest was Carswell McClellan, a civil engineer, who became topographical assistant on the staff of General Andrew A. Humphreys, United States Army during the Rebellion, was present in most of the important battles participated in by the Army of the Potomac, and was twice wounded. The other son, General Henry B. McClellan, served in the Confederate Army as Assistant Adjutant-General of the Cavalry Corps of the Army of Northern Virginia. He was, during the latter part of the war, Chief of Staff to Generals James E. B. Stuart and Wade Hamp-

ton, and served by assignment on the staff of General Robert E. Lee. Since 1870 he has been principal of Sayre Female Institute in Lexington, Ky. Dr. George McClellan, son of the late Dr. J. H. B. McClellan, was graduated in 1870 at the institution founded by his grandfather, and is now a prominent member of his profession in Philadelphia. He is believed to be the only living medical representative of his distinguished ancestors.

McDANIEL, Edward Davies, of Mobile, Ala., was born in Chester county, S. C., July 7, 1822. He belongs to the Scotch-Irish element of our population. His grandfather was Edward McDaniel, a soldier of the Revolution,

Ed. McDaniel

who died after the close of that war, of a wound received in his country's service; his grandmother was Elizabeth McCaw McDaniel, who, like many other women of the period, live to ripe old age. His father was William McDaniel, a civil engineer and a teacher of mathematics. His mother was Jane Strong McDaniel. His father died at the early age of forty-one years, leaving six children, most of them small and helpless. The administrator of the small estate that was left, ran away with the proceeds, and left the mother and children to struggle for subsistence as best they could. Edward Davies, the second in age of the three boys, being only eight years old, attended the instructions of some graduates of Edinburgh, who for a number of years taught in the vicinity. On reaching the age of twelve years, he had completed geography, arithmetic, English grammar, and book-keeping. He then spent eighteen months in a mercantile house, and thence, after attending some high schools for a time, he repaired to Erskine College, S. C.,

where, after six years of incessant study (he took no vacation), he received, in 1844, the degree of A. B. In less than a month after graduating, he was employed as principal of an academy in his native county, and at the same time began the study of medicine, under Dr. John Douglass. At the end of 1845, some old college friends in Alabama, recommended him to their friends, and he removed to Dallas county, Ala., where he continued to teach and to study medicine until the fall of 1855, when he entered the Medical College of the State of South Carolina, at Charleston, and at the same time the School of Anatomy and Physiology, taught by many eminent medical scholars of Charleston. In the spring of 1857, he graduated in medicine from the Medical College of the State of South Carolina, and returning to Alabama, located at Camden, Wilcox county, where he at once obtained a very large practice, and maintained it for more than thirty years, at the end of which time advancing age and failing health admonished him to relax his bodily efforts. On May 12, 1858, he was married to Miss Matilda Blair Tabb, of Dallas county, Ala., who made him the father of nine children, and died in 1890. Dr. McDaniel received the degree of A. M. from Erskine College, in 1849: and in the early fifties the same degree from the University of Alabama. Early in the seventies he received the degree of LL. D. from the University of Alabama. Sometime about 1853, the University of Alabama advertised that an "honorary certificate" would be awarded to the teacher whose pupil, from any State, should, on competitive examination be found the best prepared, and awarded the certificate to McDaniel. Dr. McDaniel is an ex-member of the town council of Camden, of the board of health of Camden, an ex-health officer of Wilcox county, an ex-vice-president of the Wilcox County Medical Society, an ex-secretary, ex-treasurer, ex-president of the same society in which he served in these offices for many years. He has been respectively vice-president and president of the Alabama State Medical Association. He is the author of many papers, read before the Wilcox County Medical Society and the Alabama State Medical Association. His most important contributions to medical literature are, a paper "On Irritation of the Urinary Organs, Produced by Santonica and Santonine," published about 1869 in the *New Orleans Medical and Surgical Journal*; a paper on "Hemorrhagic Malarial Fever in Alabama," *Transactions of Alabama State Medical Association*, 1874; one on "A New Method of Artificial Respiration and the Care of New-born Babies," in *Transactions of the American Medical Association*, for 1869; and again, with more amplification, in the *Transactions of Alabama State Medical Association*, somewhere between 1870 and 1880; and two papers on the "Report of 188 Cases of Hemorrhagic Malarial Fever," showing pernicious effects of quinine in the treatment. His method of artificial respiration, after elaborate investigation, on the part of the State Board of Health of Alabama, was adopted as the authorized method in the State. For the last six years Dr. McDaniel has held the Professorship of *Materia Medica, Therapeutics, and Clinical Medicine* in the Medical College of Alabama.

McDOWELL, Ephraim, of Danville, Ky., was born in Rockbridge county, Va., November 11,

1771, and died at his home, June 25, 1830. The following interesting details of his life and professional achievements are derived from an extended sketch by the late Prof. S. D. Gross, in his *American Medical Biography*," and from a recent address on "Pioneer Surgery in Kentucky," by Prof. D. W. Yandell as president of the American Surgical Association. It is known that this world-renowned surgeon was a descendant of a sturdy stock, his blood being especially rich in two of the best crosses—the Scotch-Irish. His great-grandfather rebelled against the hierarchy of his time and enlisted as a Covenanter, under the banner of James I. After honorable service, he laid down his arms, gathered his family together, and came to America. It was in honor of this ancestor that the subject of this sketch was named. The maiden name of his mother was McClung. She was a member of a distinguished family of Virginia. His father, Samuel McDowell, was a man of note and influence in that State, and was honored with many positions of trust. In 1773 he removed with his family to Danville, Ky. At this time his son Ephraim was but two years of age. Having been appointed a commissioner to settle land claims in the Territory, he entered immediately upon the discharge of his onerous and responsible office. During his residence there he was also made judge of the district court and took part in organizing the first court ever formed in the Territory of Kentucky. He remained upon the bench until within a few years of his death, which occurred in 1817. He lived to see his son, who was the ninth of twelve children, become the foremost surgeon south of the Blue Ridge. But it was not given to eyes of that day to see that the achievements of the village operator had illuminated all the work which has since been done in the abdominal cavity; that one had grown up and toiled in their midst—

"Whose influence ineffable is borne
Round the great globe
To cheerless souls that yearned
In darkness for this answer to their needs.

Young McDowell's early education was obtained at the school of the town in which he lived, and at an institution of somewhat higher pretensions, situated in a county near by. No anecdotes are preserved of his childhood. During his school age he clearly preferred the out-door sports of his companions to the indoor tasks of his teachers. On quitting school, he crossed the Alleghanies and became an office pupil of Dr. Humphreys, of Staunton, Va. After reading under this preceptor for two years, he repaired to the University of Edinburgh. The Scotch metropolis was then styled the "Modern Athens." It afforded opportunities at that time for acquiring a medical education the best in all the world. "It was then to the medical profession what Leyden had been in the days of Sir Thomas Browne; what Paris became when Velpeau and Louis taught there. He entered the private class of John Bell, whose forceful teachings and native eloquence made a lasting impression on the mind of the youthful hearer. It has been said that McDowell conceived the thought of ovariectomy from some suggestions thrown out by this great man." It is difficult to conceive at this distant day the charm which that great teacher infused into his subject and the ambition which he inspired in

his pupils. All loved him, not a few idolized him. Among the latter was the subject of this memoir. During his attendance upon his prelections, the young American was enraptured by the eloquence of his teacher and the lessons which he imbibed while thus occupied were not lost upon him after his return to this country. Mr. Bell is said to have dwelt with peculiar force and pathos upon the organic diseases of the ovaries, speaking of their hopeless character when left to themselves, and of the possibility, nay practicability of removing them by operation. The instruction thus given made a powerful impression upon McDowell which as has been stated was not lost upon him after he took leave of the academic groves of Edinburgh. He resided abroad for about two years, during which time he stored his mind with a large amount of useful information. He came away without a diploma, but with what was of far greater value than a degree the acquisition of that anatomical and surgical knowledge requisite to place him in the front rank of his profession. He returned to his home in Kentucky in 1795 and settled among the people who had known him from boyhood. His success was immediate and yet Dr. Samuel Brown who knew him in Virginia and was his classmate in Scotland had said when asked of him: "Pish! he left home a gosling and came back a goose." In a little while he commanded all the surgical operations of importance for hundreds of miles around him and this continued till some years later, when Dudley returned from Europe to share with him the empire in surgery. In 1802, fully established in his profession and with an income which rendered him independent, he married Sarah, daughter of Governor Isaac Shelby. In 1809 he did his first ovariectomy. "This deed, unexampled in surgery, is destined to leave an ineffaceable imprint on the coming ages. In doing it Ephraim McDowell became a prime factor in the life of woman; in the life of the human race. By it he raised himself to a place in the world's history alongside of Jenner, as a benefactor of his kind; nay, it may be questioned if his place be not higher than Jenner's, since he opened the way for the largest addition ever yet made to the sum total of human life." He believed this operation to be without precedent in the annals of surgery, yet he kept no note of it or of his subsequent work. He prepared no account of it until 1817. This appeared in the *Eclectic Repertory*. It was so meager and carelessly written and yet so startling, that surgeons hesitated to credit its truth. The paper was thought to bear internal evidence of its author having "relied upon his ledger for his dates and upon his memory for the facts." The critics from far and near fell upon him. The profession at home cast doubt upon the narrative. The profession abroad ridiculed it. For all that McDowell kept his temper and his course, and when he finally laid down his knife he had a score of thirteen operations done for diseased ovaria, with eight recoveries, four deaths, and one failure to complete the operation, because of adhesion. Referring to the *technic* observed by McDowell, one of his biographers, Dr. Yandall, remarks that the procedure in many of its features was necessarily that of to-day. "The incision was longer than now usually made, and the ends of the pedicle ligature

were left hanging from the lower angle of the wound, but the pedicle itself was dropped back into the abdomen. The patient was turned on her side to allow the blood and other fluids to drain away. The wound was closed with interrupted sutures. This marvel of work was done without the help of anesthetics or trained assistants, or the many improved instruments of to-day, which have done so much to simplify and make the operation easy. McDowell had never heard of antiseptics, nor dreamed of germicides, or germs; but water, distilled from nature's unpolluted cisterns by the sun, and dropped from heaven's condensers in the clean blue sky, with air winnowed through the leaves of the primeval forest, which deepened into a wilderness about him on every hand, gave him and his patients aseptic facility and environment which the most favored living laparotomist well might envy. These served him well, and six out of seven of his first cases recovered. He removed the first tumor in twenty-five minutes, a time not since much shortened by the average operator." Referring to this first case of ovariectomy the late Dr. Gross says: Dr. McDowell had practiced medicine and surgery for fourteen years, and had secured for himself a large share of reputation for his bold and successful exploits, when in the autumn of 1809 he was consulted by Mrs. Crawford, the subject of a large ovarian tumor, whose case from its novelty and the attendant circumstances, must forever remain memorable in the annals of our profession. After a most thorough and critical examination, Dr. McDowell informed his patient, a woman of unusual courage and strength of mind, that the only chance for her relief was excision of the diseased mass. He explained to her with great clearness and fidelity the nature and hazzard of the operation; he told her that he had never performed it, but that he was ready, if she were willing, to undertake it, and to risk his reputation upon the issue, adding that it was an experiment, but an experiment well worthy of trial. Mrs. Crawford listened to the surgeon with great patience and coolness, and at the close of the interview, promptly assured him that she was not only willing, but ready to submit to his decision; asserting that any mode of death, suicide excepted, was preferable to the ceaseless agony which she was enduring, and that she would hazard anything that held out even the most remote prospect of relief. The result has been long before the profession. Mrs. Crawford submitted to the operation, and thus became the first subject of ovariectomy, of whom we have any knowledge. He had thoroughly studied the relations of the pelvic viscera, in their healthy and diseased conditions, and felt fully persuaded of the practicability of removing enlarged ovaries by a large incision through the wall of the abdomen. He knew very well that the Cæsarian section had been repeatedly performed with success, and he could perceive no reason why ovariectomy should be attended with more difficulty to the surgeon, or greater hazard to the patient. When Dr. McDowell undertook this operation he was not aware that it had ever been performed by any one else, a precedence which certain writers have attempted to prove. In speaking of his first case, he distinctly states that he had "never seen so large a substance

extracted, nor heard of an attempt or success attending any operation, such as this required, nor was such an operation ever performed before." Referring to its priority the eminent Gross has said: "From all the testimony that I have been able to collect upon the subject, I am satisfied that it was first executed by Dr. McDowell." It may not be improper to state, in concluding the consideration of this part of Dr. McDowell's professional services, that an attempt was made, many years ago, to deprive him of the credit of his first operation, by ascribing the performance of it to his nephew, Dr. James McDowell, at the time his partner in practice. In consequence of this attack upon his veracity and pretensions to surgery, Dr. McDowell was induced, in 1826, to address a printed card to the "physicians and surgeons of the West, and particularly to the medical faculty and class at Lexington," in vindication of his claims. After remarking that he had visited Mrs. Crawford, the subject of the operation in question, at her residence in Green county, Ky., a distance of sixty miles from Danville, for the purpose of examining her case, and that she soon after came to his own house, to undergo the operation of ovariectomy, he says: "My nephew, Dr. James McDowell, whom I had brought up, had graduated a few months before this time, in Philadelphia, and had commenced business as my partner. Being in delicate health at the time, it was my intention to remove to the country in the spring, or as soon as I could establish my nephew in business. From the time of Mrs. Crawford's arrival, he had made frequent attempts to persuade me from operating; but, finding my determination was fixed, he agreed to be present, but not until the morning I operated, and as my partner, to assist; for, should the patient die, the responsibility was all my own; should the patient live, it would assist him in his outset in business. The day having arrived, and the patient being on the table, I marked with a pen the course of the incision to be made; desiring him to make the external opening, which, in part, he did; I then took the knife, and completed the operation, as stated in the *Medical Repertory*. Although the termination of this case was most flattering, yet I was more ready to attribute it to accident than to any skill or judgment of my own; but it emboldened me to undertake similar cases; and not until I had operated three times—all of which were successful—did I publish anything on the subject. I then thought it due to my own reputation, and to suffering humanity, to throw all the light which I possessed upon diseased ovaria." It was not alone, however, in this hitherto unexplored field of surgery, that McDowell showed himself a master. His skill was exhibited equally in other capital operations. He acquired at an early day distinction as a lithotomist, which brought to him patients from other States. He operated by the lateral method, and for many years used the gorget in opening the bladder. At a later period he employed the scalpel throughout. For a time he was almost the only physician in Kentucky who performed this operation. In the latter period of his life, he was eclipsed, in this branch of surgery, by his neighbor, Dr. Dudley, of Lexington, who, after the establishment of the Transylvania Medical School, for

many years almost monopolized the stone cases in Kentucky and the adjoining States. It is not known how often Dr. McDowell performed this operation; but it is positively ascertained that he had, up to 1828, two years prior to his death, executed it thirty-two times, and that without the loss of a single patient. Such success is as rare as it is creditable to Dr. McDowell's skill and judgment. One of his most interesting cases, not from any peculiar circumstances or merit, but from the exalted position afterwards attained by the patient, was that of the late James K. Polk, President of the United States. This gentleman had suffered from symptoms of vesical calculus from an early period, and in his seventeenth year he was induced to visit Danville in search of advice. The operation was performed in the autumn of 1812, with Dr. McDowell's usual skill, and a happy recovery was the consequence. The calculus was of small size, very hard and heavy, with a rough, tuberculated surface. Mr. Polk carried it home with him, not in his bladder, but in his pocket, to show it to his friends and neighbors, with whom it was a source of great curiosity. In a letter, dated in Maury county, West Tennessee, December 3, 1812, he informs his surgeon of the progress of his cure, and feelingly expresses his sense of gratitude for the services which he had received from him. This letter, as a specimen of literary composition, is far below mediocrity; it is badly spelled, and written in the worst style. In these respects, it is in striking contrast with another letter addressed to Dr. McDowell, nearly fourteen years afterward, when Mr. Polk represented his adopted State in the Congress of the United States. In this communication, written with great accuracy, and even eloquence, Mr. Polk again expresses his gratitude to Dr. McDowell; speaks of the excellence of his health, and alludes to the manner in which he had spent his time since his recovery from the operation. "I have been enabled," he says, "to obtain an education, study the profession of law, and embark successfully in the practice. I have married a wife and permanently settled in Tennessee, and now occupy the station in which the good wishes of my fellow-citizens have placed me. When I reflect, the contrast is great, indeed, between the boy, the meager boy with pallid cheeks, oppressed and worn down with disease, when he first presented himself to your kind notice in Danville nearly fourteen years ago, and the man at this day in the full enjoyment of perfect health." The career of that gentleman and that of his surgeon show how early obstacles may be vanquished by industry, and how perseverance enables men from small beginnings to attain to great ends. It is inferred that Dr. McDowell performed numerous other operations. His anatomical knowledge, courage and dexterity were sufficient to enable him to execute any operation that might have been required within the extensive circle of his practice. It can not be supposed for a moment that the man who was the first to excise a diseased ovary, and who cut thirty-two patients for stone without a single failure, would shrink from the performance of any surgical duty, however novel or hazardous, provided he was certain that it was imperatively demanded by the circumstances of the case. He paid much attention to the subject of hernia. He often operated successfully for the relief of strangulation, and

performed many radical cures by means of the truss. His reputation in this branch of surgery attracted patients from a great distance. It is said that as a surgeon, Dr. McDowell was exceedingly cautious, and never undertook an operation until his own mind and the patient's system were prepared to his entire satisfaction. Notwithstanding his extraordinary accuracy in anatomical and surgical knowledge, he never operated, in any important case, without carefully reviewing the relations of the structures involved, and referring to the best surgical authorities in his library on the subject. His pupils were obliged to do the same thing, as well as to examine the case, and favor him with their opinion on it. His assistants were carefully selected and regularly drilled, until, like so many Thespians, they perfectly understood their parts. He was remarkably kind to his patients, sympathizing with them in their suffering, and encouraging them by tender and soothing expressions. His hand never quivered in an operation, nor did his mind quail; but his face flushed, and even in the depth of winter the perspiration often started from every pore. One who knew Dr. McDowell intimately, and who was himself an excellent operator, writes that he was the best operator he ever saw, in all cases where he had a rule to guide him. He always preferred to operate on Sunday mornings, saying that he liked to have the benefit of the prayers of the church. He was an accomplished anatomist. He made it a business to dissect, more or less, every winter, and he took special pains, on such occasions, to aid his pupils in acquiring a knowledge of the human structure. Subjects were not always obtained, at that period, without trouble and even risk. Dr. McDowell was no writer. The only contributions he ever made to medical literature are his first five cases of ovariectomy, in the seventh and ninth volumes of the *Philadelphia Eclectic Repertory*. It is a subject of deep regret that he should have felt, throughout the whole of his life, such a deep repugnance to the publication of the results of his experience. Extensively engaged, as he was, for so long a period in the practice of medicine and surgery, he must have accumulated a vast amount of knowledge, most valuable to the profession and to suffering humanity, and eminently conducive to the extension of his own fame. But such exercise was distasteful to him, and no remonstrance on the part of his friends could induce him to engage in it. Temporary notoriety and posthumous fame were subjects alike of indifference to him. He pursued the "even tenor of his way," and his habits were so confirmed that it was impossible to change them. Dr. McDowell was an honorary member of several medical associations. The Medical Society of Philadelphia, one of the oldest and most respectable institutions of the kind in the country, sent him its diploma in 1807. In 1825 he received from the University of Maryland, then in the height of its renown, the honorary degree of Doctor of Medicine—a distinction which was a full acknowledgment of his exalted reputation, and which afforded him genuine gratification, the more especially as it was unsolicited upon his part. Referring to his ability as a surgeon, Dr. Gross has written: Had Dr. McDowell lived in France, he would have been elected a member of the Royal Academy of Surgery, received the cross of the Legion of

Honor from the King, and obtained a magnificent reward from the government as an acknowledgment of the services which he rendered his country, his profession and his fellow-creatures. His own country, and especially his own neighborhood and State, failed to appreciate him. It was said by one whose veracity was indisputable that but few of his immediate fellow-citizens were capable of drawing a just distinction between him and the merest charlatan in his vicinity. Such must ever be the fate of true greatness in all new communities. Dr. McDowell had the misfortune to live before his time; he was born in advance of his age. It is said that he was a kind-hearted, amiable man, an urbane and accomplished gentleman, a benevolent physician, a warm and generous friend, an excellent neighbor, an affectionate husband and an indulgent and anxious parent. His character in all the relations of his life was most exemplary. Of a lively, social temperament, abounding in wit and pleasantry, he was the master spirit and delight of every company which he honored with his presence. His great deeds had not made him arrogant. No man was ever more agreeable, more amusing, more unassuming. Frank in his manners and easy of access, it was impossible to be a stranger in his society, or to leave his presence without a feeling of regret. In person, Dr. McDowell was commanding. He was tall, nearly six feet in height, broad-shouldered, stout-limbed. His head was large, his nose prominent and full of character, his chin broad, his lips full and expressive of determination, his complexion florid, his eyes dark—black. He was of a remarkably happy disposition, and rather inclined to corpulency. Up to the very time of his sickness, he was one of the most active men in Kentucky. As an illustration of his agility and muscular strength, the following anecdote, which he often narrated with special glee, affords a striking example: While he sojourned in Edinburgh, a celebrated Irish foot-racer, a sort of Mike Fink, arrived, boasting that he could out-run, out-hop and out-jump any man in the city, and bantering the whole medical class. McDowell was selected as their champion. The distance was sixty yards, and the stake ten guineas; the trial took place in the college grounds, and the American purposely allowed himself to be loser. A second race for one hundred guineas, and at an increased distance, came off soon afterwards, and this time the Irishman, after much bullying, was badly beaten, much to his own chagrin and the gratification of the students. As a scholar, he was entitled to no ordinary rank in comparison even with some of his most distinguished contemporaries of the learned profession of which he was a member. He was much devoted to study, especially in early life, and was a most admirable recitationist. He was fond of Greek and Latin, a knowledge of which he retained long after his return from Europe. But historical and belles-lettres literature occupied more of his time and attention than classical and scientific works. Burns and Scott were his greatest favorites. In his readings of these authors, he rolled the Scottish idiom upon his tongue in a manner perfectly indescribable. His voice was clear and manly; he often exercised it in recitations from Scottish dialogues, and his adapting its intonations to the sup-

posed character of the speaker was said to be more entertaining and exciting than any theatrical exhibition. He was fond of music, and sung a variety of odes and catches in Latin, English and Scotch, in good taste and with fine comic effect. His favorite pieces—those of a comic and humorous character—he frequently accompanied with his violin, an instrument to which he was very partial, but upon which he was a poor performer. Like Themistocles, the Athenian, “he could not fiddle, but yet he could make a small town a great city;” he could achieve wonders in surgery, such as had never been achieved before, and thus immortalize his State and country. His excellence in the Scottish dialect and melody is probably attributable to his summer rambles in Scotland during the vacations of the medical sessions in the University of Edinburgh. In company with two of his classmates, Dr. Brown and Dr. Speed, of Kentucky, he perambulated a considerable portion of that “land o’ cakes,” much to their mutual delight and edification. They traveled on foot, each packing a change of clothes in a wallet. In the tour, Dr. McDowell met with several respectable members of his family connection, who recognized and received him as a clansman, pretty much after the style and manner of hospitality commemorated and immortalized by Burns and Scott. The travelers were well provided with letters to distinguished personages, “*en route*” who never failed to treat them with marked attention and respect. On approaching the residences of these individuals they always hired a conveyance, and riding up in due form and style, were received accordingly. They, however, if their entertainment was to their liking, soon “let the cat out of the wallet;” immediately upon which all formality ceased, and they were carried about all over the neighborhood, either on horseback or in a coach, as they happened to fall in with a commoner or a “gigman,” and exhibited to all sorts of people as gentlemen from the extreme backwoods of America. It is very questionable whether the United States have had, at any time since, the good fortune to be more creditably represented in that ancient and interesting country; a trio of equal intelligence, of fine looks, wit, and good fellowship, is rarely to be found anywhere. After his return to Kentucky, Dr. McDowell frequently recurred in terms of the greatest delight, to the happy hours spent in these peregrinations, recounting with peculiar glee the incidents which befell him and his backwoods companions. He ever after cherished a warm attachment for the Scotch, their beautiful and romantic country, and their noble, scientific, and charitable institutions. His library was quite extensive for the period in which he lived, consisting of all the standard medical works, many of which he had brought from Europe. On the practice of physic he always procured and read the most celebrated authorities; more it is said on account of his students, of whom he always had a considerable number, than of his patients. He was an ardent admirer of Sydenham and Cullen and never could appreciate any advances worthy of note upon these celebrated writers. With many of his contemporaries, he regarded the portraits of disease, delineated by the hands of these masters as inimitable. In his judgment,

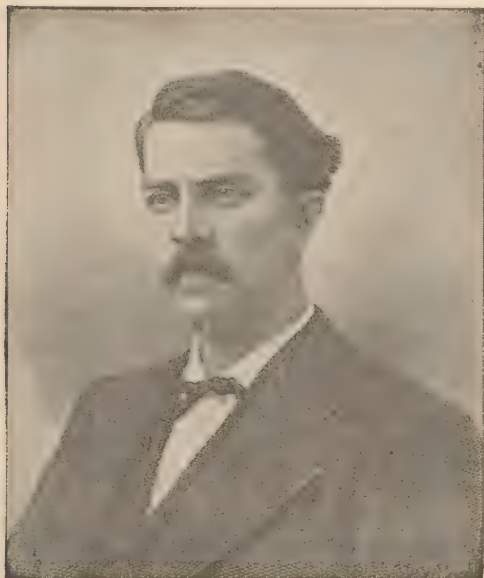

all other writers on the practice of medicine were mere bunglers and copyists; a decision in which nearly all intelligent men of that period concurred. He was in the habit of earnestly cautioning his student against too free use of medicine. As a secret, he apprised them of his impression that the employment of medical drugs was more of a curse than a blessing to the human race, and that quackery perpetrated much more mischief and destruction by their means than the science of the profession could counteract. In the surgical branch of the profession he took great delight; he characterized it as the certain branch of the healing art, and spared no pains to advance and perpetuate his knowledge of it. He does not seem to have had any particular fondness for the practice of medicine, as he always had a partner upon whom devolved most of this kind of business, especially after he had achieved some reputation as a surgeon. His fees for surgical operations were regulated as a general rule by the ability of his patients. As might be supposed from the extent of his practice, and from his benevolent disposition, he frequently rendered his service gratuitously. Pauper patients no doubt often went to him from a great distance, and McDowell would have been the last man to turn a deaf ear to their entreaties for advice and relief. To a humane surgeon fully appreciating his duty, the claims of the sick poor appeal with irresistible force, proving paramount to every selfish consideration; they are his best subjects because in the language of Boerhaave, "God is their pay master, and because the expression of their gratitude is voluntary, not extorted in the hope of obtaining a small bill for services received from their professional attendants." Occasionally his fees were large; in one instance almost princely. Allusion is made to the case of Mrs. Overton, upon whom he performed the operation of ovariectomy in the summer of 1822. This lady lived in the vicinity of the Hermitage, in Tennessee, the residence of President Jackson, and Dr. McDowell had agreed to operate upon her at her own house for five hundred dollars. He remained with her for some days and on the morning of his departure, her husband, a highly respectable and intelligent citizen, gave him a check, as he supposed for the stipulated sum, on one of the banks of Nashville. On presenting it, he discovered that it was drawn for fifteen hundred dollars, instead of five hundred. Presuming that a mistake had been made, he immediately dispatched his servant to the gentleman, who replied that no mistake had occurred, and that the services he had received from Dr. McDowell more than counterbalanced the sum he had paid him. Such generous liberality was alike honorable to the giver and to the receiver. So far as known, says Gross, this was the largest fee ever paid in this country for a surgical operation. Considering the value of money at that time in the Southwest, or, in other words, the cheapness of living, and the comparatively small compensation for professional services generally, it was fully equivalent to the celebrated fee of a thousand guineas paid by Mr. Hyatt, a West Indian merchant, for an operation performed upon him by Sir Astley Cooper. Referring to the original charge of five hundred dollars, Dr. Yandall has well said that McDowell had a proper appreciation of what was

due his guild from those whose means allowed them to make remuneration for professional services. When the fact is borne in mind that the purchasable value of money was much greater then than now, it will be seen that the "father of ovariectomy" at least set his successors in the field a good example. This is made conspicuous by the fact that Sir Spencer Wells has declared this amount of money a sufficient fee for the operation, and has seldom charged a larger sum than this. Dr. McDowell was not wealthy; his estate at the time of his death was estimated at from forty to fifty thousand dollars. His mode of living was plain and unostentatious; he was always glad to see his friends, and to extend his hospitalities to them. He was a man of enlarged and liberal views. He spent his money and his time freely upon charitable objects, and manifested great interest in advancing the prosperity of Danville, the scene of his professional labors and renown. Of Centre College, located in that town, which became the most successful literary institution in Kentucky, he was one of the founders and original trustees; subscribing liberally towards its support. Dr. McDowell was always a decided Christian in his feelings and conduct. At the time of his settlement at Danville, in the latter part of the last century, nearly the entire male population of the village was atheistically inclined; and not a few were of the Robespierian school, having achieved the grand discovery that "death is but an eternal sleep." With these men he had no sympathy, though he was of too benevolent and tolerant a nature to fall out with any one for entertaining different tenets from his own. He lived a God fearing man, and two years before his death united with the Episcopal church. He expired in the fifty-ninth year of his age. His disease was inflammatory fever. From the very moment of his seizure he had a presentiment that he would not survive it. The malady terminated his life on the fourteenth day of the attack. Dr. McDowell remained faithful to his profession until the last moments of his life. He literally died in the harness. A few months before his final illness he commenced the building of a large and beautiful mansion in the country; two miles from Danville, where he intended to spend the evening of his life, away from the cares and fatigues of a busy practice. Death, as has already been seen, frustrated this design. The mansion was finished, but occupied by other tenants. To the professional pilgrim of the West, it will not be uninteresting to know that the remains of Kentucky's first great surgeon repose in the family burial ground of Gov. Shelby, five miles from Danville. His tombstone, a plain slab of marble, bears the simple inscription of his name, "Ephraim McDowell."

MCGAUGHEY, James Brown, of Winona, Minn., was born near Gettysburg, Pa., December 31, 1842. Parentage Scotch-Irish. Grand parents were all natives of the United States. He attended the public schools of Illinois, and was pursuing studies at a private academy in Macomb, Ill., at the outbreak of the war of 1861-65. Dr. A. B. Stuart, formerly of Macomb, Ill., was his medical preceptor. He was graduated from the medical department of the University of Michigan in March, 1867, and located in Winona, Minn., in April of that year, since which time he has, without

interruption, pursued the general practice of medicine and surgery at that place. He served as private hospital steward and Second Lieutenant in the United States Volunteer Army from January 11, 1862, to October 20, 1865. He has been a member of the Winona County Medical Society from its organization; secretary since 1872; is a member of the Minnesota State Medical Society; president, in 1884, of the Minnesota Academy of Medicine, and of the American Medical Association (1872). He was coroner of Winona county in 1872-4, and served as a member of the Board of Education of the city of Winona for a period of ten years. In January, 1891, he received the appointment of member of the Board of Medical Examiners for the State of Minnesota, which position he now holds. He is also secretary of the Board of United States Pension Examining Surgeons at Winona.

McGUIRE, Hunter Holmes, of Richmond, Va., son of Dr. Hugh H. McGuire, was born in Winchester, Va., October 11, 1835. He was

Hunter McGuire.

educated at Winchester Academy, and studied medicine at the Medical College of Virginia, the medical schools of Philadelphia and New Orleans, and Winchester Medical College, from which he received his diploma in 1855. He practiced first in Winchester, holding the Chair of Anatomy in the Medical College from 1856 to 1858, when he removed to Philadelphia. In the beginning of the Civil War he enlisted in the Confederate Army, was soon promoted to the post of Medical Director of the Army of the Shenandoah Valley and brigade surgeon under "Stonewall" Jackson, 1861-62, and was afterward Medical Director of the Second Corps, Army of Northern Virginia, 1862-65. He was married December 19, 1866, to Mary, daughter of Hon. A. H. H. Stuart, of Virginia. At the close of the war he was elected Professor of Surgery in Virginia Medical College, Richmond, which chair he held until 1880. He was made professor emeritus

in that institution in 1885. Dr. McGuire organized in connection with his large surgical practice St. Luke's home for the sick in Richmond, with a training school for nurses. He was president of the Association of Confederate Medical Officers in 1869, and of the Virginia Medical Society in 1873; vice-president of the International Medical Congress in 1876, and of the American Medical Association in 1881, and president of the American Surgical Association in 1887. In June, 1892, Dr. McGuire was also unanimously elected president of the American Medical Association. The University of North Carolina in 1887 gave him the degree of LL. D. He has published in medical journals and in various papers an account of the circumstances of the wounding and death of Gen. T. J. (Stonewall) Jackson, whom he attended. Among his contributions to medical literature the following are the most important: "Gunshot Wounds of Joints;" "Excision of Os Calcis;" "Fibro Cystic Tumors of Uterus with Case;" "Gunshot Wounds of Pelvis Followed by Stone with Three Cases;" "Clinical Lectures on Stone in the Male;" "Extract from Clinical Lectures on Stone in the Female Bladder with Case;" "Drainage in Obstinate Chronic Inflammation in Female Bladder;" "Use of Adhesive Plaster in Chronic Urinary Abscess;" "Cases of Ovarian Tumor Operations;" "Gunshot and other Wounds of the Peritoneum;" "Varicocele, How to Operate;" "Ligation of Aorta;" "Ligation of Sub-Clavian;" "Injecting Male Bladder Without the Use of a Catheter and some of Its Advantages." He has also contributed to John Ashhurst's "International Cyclopedia of Surgery," 1884; William Pepper's System of Medicine, 1885-87; and the American edition of Holmes' "Surgery."

McKEE, Edward Sydney, of Cincinnati, O., son of William McKee and Louisa (Stipp) McKee, was born near Hamilton, O., January 6, 1858. He received his literary education at Monmouth College, Miami University, and the University of Cincinnati. After graduating in medicine at the Medical College of Ohio (Cincinnati), the doctor spent more than two years abroad continuing his medical studies in the universities and hospitals of London, Paris, Vienna, Leipsic, Berlin and Dublin. He began the practice of medicine in Cincinnati, and was married November 16, 1882, to Miss Louise McClintock, a graduate, with honors, at the Oxford College. The Doctor is clinical lecturer on gynecology at the Medical College of Ohio, and assistant to the chair of obstetrics and gynecology in the same institution. He was at one time clinical assistant in the Hospital for Sick Children, London, England. Dr. McKee is secretary of the Mississippi Valley Medical Association, and also of the Obstetrical Society of Cincinnati. He was a member of the International Medical Congresses at London and Washington, and the German Congress fuer Innere Medizin which met at Wiesbaden. He is a member of the American Medical Association, Mississippi Valley Medical Association, Ohio State Medical Society, Southwestern Ohio Medical Society, Obstetrical Society of Cincinnati, and the Cincinnati Academy of Medicine. Dr. McKee has earned considerable fame in the line of medical literature. His writings may be found in "The Reference Handbook of the Medical Sciences," New York; "The Annual

Edward S. McKee.

of the Universal Medical Sciences," Philadelphia, and "Diseases of Women," Second American Edition, by A. Martin, of Berlin. He has also been a frequent contributor to many of the best medical journals of America, and some of his writings have been widely quoted and highly complimented. Among his works which have obtained favorable notice are, "Cephalhaematoma," "Hour Glass Contraction of the Uterus," "Malformation of the Heart, Congenital," "The Hymen," "Consanguinity in Marriage," "The Early Diagnosis of Pregnancy," "Obesity in its Relation to Menstruation and Conception," "Ovarian Prolapse," "Vaginal Extirpation of the Uterus for Cancer," "Sterility in Woman, its Aetiology and Treatment," "External Means in the Diagnosis of Pregnancy," "One Hundred Deliveries," "Pruritus Pudendi," "Abortion," and "Repeated Abortion." Dr. McKee began his literary career as city editor of the *Richmond (Ind.) Daily Independent*, previous to his commencing the study of medicine.

McKENNAN, T. M. T., of Pittsburgh, Pa., was born in Washington, Pa., July 13, 1859. His father was Dr. Thomas McKennan, a well-known physician. His grandfather was the Hon. T. M. T. McKennan, a member of Congress for many years, and also a member of President Fillmore's Cabinet, as Secretary of the Interior. Dr. McKennan received his classical education at Washington and Jefferson College, graduating in 1879. He then attended three full courses at the medical department of the University of Pennsylvania, Philadelphia, and graduated in 1882. He was then appointed a Resident Physician in the Western Pennsylvania Hospital, at Pittsburgh, and after one year's service, went to Minneapolis, Minn., to practice. He only stayed there one year, when he returned to Pittsburgh, and after practicing six months, was appointed an Assistant Physician in the Western Pennsylvania Hospital for the Insane, at

Dixmont, Pa. He remained there two years, and left to accept the position of Professor of Anatomy in the Western Pennsylvania Medical College, at Pittsburgh, in 1886. He still occupies that chair. He attended a course on neurology of three months in London, 1891. He holds the following hospital positions: Assistant Surgeon to the Western Pennsylvania Hospital; Physician of Insane Department of St. Francis Hospital; Physician to the Pittsburgh Hospital for Children, and to the Rosalie Foundling and Maternity Hospital. He is a member of the Allegheny County Medical Society, Pennsylvania State Medical Society, Minnesota State Medical Society, and American Medical Association. Dr. McKennan has contributed to the medical journals from time to time, and has performed many important operations, notably: Removal of enlarged spleen, excisions of hip and knee joints, trephining for abscess of the cerebellum, many amputations of the leg and thigh, besides numerous minor operations.

McLAIN, John S., of Washington, D. C., was born in that city, August 9, 1848. He studied medicine at the National Medical College, medical department of Columbian University and received his degree of M. D. from that institution in 1871. He practiced his profession in his native city for the next three years, and was House Surgeon at Providence Hospital in 1873. In 1874 he was appointed Acting Assistant Surgeon United States Army, and served with the Eighth United States Cavalry in New Mexico until 1876, and participated in numerous expeditions in search of hostile Indians who had committed depredations in that section of the country. He was with General Miles at that time Colonel of the Fifth United States Infantry, in scouting the "Staked Plains" and the "Pan Handle" of Texas, and portions of the Indian Territory, from October, 1874, till January, 1875, when he returned to his post, Fort Union, New Mexico, having been in the field five months on an expedition that was ordered for forty days. He was also with the troops in the southwest Colorado during the following summer and was on duty at Fort Clark, Texas, Fort Selden and Fort Stanton, New Mexico, during the year 1876. His contract was annulled at his own request on January 1, 1877, but he was re-appointed in 1878, and was ordered to San Antonio, Texas, and was assigned duty at Fort Clarke, that State. On June 10, 1878, he was ordered to report to Col. R. S. Mackenzie, Fourth Cavalry, commanding "District of the Neuces," for duty with troops in the field "Army of Invasion," and four days later, with six companies of cavalry, eight of infantry and two batteries of artillery, nearly twelve hundred men, the command crossed the Rio Grande into Mexico. They were confronted with Mexican troops under Gen. Pedro Valdez at "Remolino," Mexico, but no engagement took place and the next day the troops recrossed the river into Texas. This movement was considered necessary on account of the continued cattle stealing at that time going on at all the fords of the Rio Grande. During the year following he spent most of the time in camp and scouting with troops on the Rio Grande, and June 2, 1879, relieved assistant surgeon H. S. Turrill, United States Army, of his duties as post surgeon and post treasurer at "Post of San Felipe," Texas,

but continued field duty during the summer. On October 6, 1879, he was ordered to accompany four companies of the Fourth Cavalry *en route* by rail from San Antonio, Texas, to Fort Hays, Kansas. On June 17, 1880, he was ordered to report to Capt. W. R. Livermore, chief engineer Department of Texas, for duty as medical officer and botanist with "an expedition to survey and explore the country west of the Pecos river in Texas." This expedition remained in the field from June 25 to December 24, 1880. During that time "Victoria," the renegade Apache, was making his celebrated raid into northern Texas and Mexico, and the command, getting upon his trail, rode sixty-five miles one afternoon and night, but he reached the Rio Grande and crossed an hour ahead in the morning, and the troops were forbidden by the laws in force at the time to follow him. Shortly afterwards his band was corralled by the Mexican troops in the mountains of Northern Mexico and captured. From June, 1881, till May, 1882, he was on duty at various posts in Texas and Kansas. On May 8, 1882, he was assigned to duty with cavalry battalion in camp on Neuces river, Texas (grazing camp in the mountains), and September 8 was ordered to proceed from said camp to Fort Brown, Texas, at the mouth of the Rio Grande, the yellow fever having broken out among the troops stationed at Brown, and one of the surgeons was down with it. He remained in quarantine at Fort Brown and yellow fever camp, adjacent thereto, until December 10, 1882, when he accompanied a portion of the Nineteenth Infantry (headquarters staff and four companies) from Brown, *via* Brazos Santiago, Gulf of Mexico, Galveston and San Antonio to Fort Clark, Texas. Arriving at Fort Clark January 1, 1883, he was assigned to duty as post surgeon at sub-post of Del Rio, Texas, relieving assistant Surgeon S. S. Tesson, United States Army. He remained on duty at Del Rio until November 12, 1883, when he proceeded to San Antonio and had his contract annulled November 18, 1883, after which he proceeded to Washington, D. C., and has since that time been engaged in the practice of his profession in that city.

McMURTRY, Lewis S., of Louisville, Ky., was born in Harrodsburg, the county seat of Mercer county, Ky., of Scotch parentage. Referring to the life and professional achievements of the subject of this sketch Dr. I. N. Love, of St. Louis, Mo., writes as follows: His youth was spent in central Kentucky, and when about sixteen years of age he entered Centre College at Danville, from which institution in due time he received the degree of Bachelor of Arts, followed afterwards by the honorary degree of A. M. He began the study of medicine in the office of the late Dr. John D. Jackson, of Danville, Ky., a man of high character, scholarly attainments, and brilliant professional qualifications. He inspired his pupils with ambition to attain high rank in the profession, and gave them systematic instructions in his office and anatomical rooms. Dr. McMurry received the degree of M. D. from the medical department of the Tulane University of Louisiana in New Orleans in 1873, and remained one year after graduation as chief-of-clinic in the great Charity Hospital in that city. He began the practice of medicine a year later in Danville, Ky.,

where he made his home for several years, devoting himself to a large general practice in Danville and surrounding counties. In 1878 he spent several months in New York pursuing studies in histology and pathology, and clinical medicine and surgery. He was chairman of the McDowell Memorial Committee of the Kentucky State Medical Society, and it was through his active efforts that the McDowell monument was erected in Danville, in 1879, to commemorate the fame of the "Father of Ovariectomy." In 1881 he accepted the chair of Anatomy in the Kentucky School of Medicine in Louisville, and filled this position for a year. He spent a portion of 1883 in Philadelphia, entering upon the study of gynecology and pelvic surgery, with a view to perfecting himself in this special branch of surgery. He, however, continued to engage in general practice until 1889, when he went to Europe in order to witness the operative methods and study gynecic surgery at the hands of the masters in that brilliant department of surgery in England, Scotland, France and Germany. Returning to America, he took up his permanent residence in Louisville. Early in his professional career Dr. McMurry exhibited a special fondness for surgery. While doing a general practice, he successfully performed most all the capital operations in surgery. Among these may be mentioned ligature of the subclavian artery for aneurism, excision of joints, and other operations. He soon acquired a wide-spread reputation, and his services were sought from all parts of Kentucky. In 1883 he successfully performed ovariectomy, and in a short time had done twenty-five abdominal sections for various conditions, with two deaths, the operations being done at the home of the patients and without skilled assistants or trained nurses. His reputation in this branch of surgery rapidly extended, and he soon left off general practice and determined to devote himself exclusively to gynecology and abdominal surgery as a specialty. From this time to the present he has given himself with unremitting energy to this branch of practice. He was among the first to push actively to the front in the Southwest the advanced principles and practice of gynecology and abdominal surgery which have within a few years revolutionized this department of medical practice. His labors and successful results have contributed largely to the establishment of the new surgery in the confidence of the profession. He has made numerous contributions to the literature of gynecology and abdominal surgery, which may be found in various medical journals and transactions of societies. He is recognized as a cautious and sagacious practitioner and painstaking, self-reliant operator. Dr. McMurry is the Professor of Gynecology in the Hospital College of Medicine (the medical department of the Central University of Kentucky), in Louisville, and Surgeon-in-Charge of the Jennie Casseday Free Infirmary for Women. He is also Gynecologist to Sts. Mary and Elizabeth Hospital. In 1888 he was elected president of the Kentucky State Medical Society. He is now (1893) president of the American Association of Obstetricians and Gynecologists. In 1890 he was elected president of the Southern Surgical and Gynecological Association. He is corresponding member of the Philadelphia Obstetrical Society; honorary member of

the Gynecological Society of Boston; Fellow of the British Gynecological Society and of the Edinburgh Obstetrical Society. He is also an honorary member of the Medical Society of the State of New York. Dr. McMurtry is about forty years of age, his home circle being composed of his mother and daughter, having lost his wife one year after marriage, in 1880. In the prime of life, in the front rank of his profession of his State, Dr. McMurtry is equipped for many long years of usefulness. His record should be emulated by those ambitious to jump too hastily into the arena of specialism immediately after graduation and before being properly trained in the broad field of general practice. Dr. McMurtry's work and position give evidence of the fact that a modest location in the out-start of the professional life is not antagonistic to great achievements and a world-wide fame. The literary style of Dr. McMurtry is smooth, terse and direct, giving evidence of scholarly attainments; and, being a careful observer, let us hope that he will be in the future, as he has been in the past, a liberal contributor to the literature of the profession. Surely no one is better prepared for furnishing the great text-book of the future and the immediate present on abdominal surgery than Dr. McMurtry. At the last meeting of the American Medical Association, held at Milwaukee, June, 1893, Dr. McMurtry was elected a member of the Board of Trustees of the *American Medical Association Journal* to fill the vacancy occasioned by the death of ex-President Dr. W. W. Dawson, of Cincinnati.

McREYNOLDS, John O., of Elkton, Ky., was born in Campbell county, Va., March 30, 1827. He is of Scotch-Irish descent, and after receiving a preliminary education, studied medicine and entered the Jefferson Medical College, from which institution he received the degree of M. D. in 1849. He located to practice in St. Louis, Mo., but finally returned to Elkton, where he has since remained, engaged in a successful and extensive practice of medicine and surgery, but devoting special attention to gynecology. In the latter branch of the profession he has performed with good results many of the more important operations. He claims to be one of the first in this country to employ the aspirator, having applied it for paracentesis thoracis, in 1872, and has since frequently used it in a variety of cases and for tapping the bladder. He is a member of the Kentucky State Medical Society, and has served on the Board of Medical Examiners for the Fourth District of that State. He was in charge of a military Hospital at Clarksville, Tenn., during the War of the Rebellion.

McSHANE, John Thomas, of Indianapolis, Ind., was born in Hamilton county, that State, December 2, 1847. He is a son of James Gray McShane and Martha (Silvey) McShane, and a grandson of Francis McShane, who came from Baltimore, Md., to Harrison county, Ky., and from thence to Hamilton county, Ind., where he settled in 1825. In 1871 Dr. McShane was married to Alice C., the daughter of the late Hon. James W. Cole, of Tippecanoe county, Ind. After obtaining a liberal literary education he began the study of medicine, in the latter county, under the preceptorship of Flavius J. Van Vorhis, M. D. In the fall of 1869 he went to Philadelphia, Pa., where he attended lectures during the winter and following summer terms in Jef-

erson Medical College. Early in the year of 1870, Dr. McShane was appointed physician to the medical department of Bedford Street Mission. During his services in that capacity, relapsing fever made its appearance in that city and many of the first cases came under his observation. The subject having been laid before the Board of Health, Dr. H. Earnest Goodman, port physician to the city and ports of Philadelphia, investigated the matter, and by his recommendation Dr. McShane was appointed assistant post physician, a position which he occupied during the prevalence of the epidemic, which continued for some months. In the fall of 1870 he returned from Philadelphia and attended a course of lectures in the

J. T. McShane

Indiana Medical College, from which he received a diploma in 1871. Again in 1885 he joined the class of Jefferson Medical College, and in 1886 he attended a course of lectures in the medical department of Tulane University of Louisiana, New Orleans. Dr. McShane's life has been one of activity in his practice, which has been large and general in character. He has occasionally taken time to write for publication articles on subjects with which his observations had made him particularly familiar, and reports of such cases as he deemed of interest to the profession, among which may be mentioned, his report of a "Case of Traumatic Tetanus, Successfully Treated by Calabar Bean," published in the *Medical and Surgical Reporter*, of Philadelphia, December 1, 1883. In this case he administered sixty grains of the extract and twenty-four ounces of the bean in six weeks, the doses of the powdered beans ranging from ten to thirty grains, repeated

part of the time as often as every two hours, the latter dose, probably, exceeding all previous records. In "Some Notes on Venesection," published in the *Medical World*, December, 1884, he reports his uniform success in the management of puerperal convulsion by the free abstraction of blood. His article published in the *Medical Mirror*, of St. Louis, on "The Use of Rhigolene in the Treatment of Carbuncles," has been widely quoted, both in this country and abroad, as has also his article "On Gnaphalium in Dysmenorrhea." For some years Dr. McShane has been surgeon of the Louisville, New Albany and Chicago Railway.

McWILLIAMS, Samuel A., of Chicago, Ill., was born February 9, 1835. He was educated at the University of Michigan, graduating in 1861, and also receiving the degree of A. M. from that institution in 1864. He then entered the Chicago Medical College, from which he received his medical degree in 1866, taking at his graduation the first prize for the best medical thesis. He soon after established himself in Chicago, where he has since remained engaged in teaching and practicing medicine and surgery. He has lectured in the Chicago Medical College on urinary and renal diseases, and was Professor of Anatomy in the Woman's Hospital Medical College of Chicago for four years, and was honored on his resignation of this chair with the presentation of a gold medal. He is a member of the Chicago Medical Society, of the Chicago Society of Physi-

J. W. Macdonald.

School, the following two years were spent in teaching a select school at North Sydney, C. B., and in 1865 he entered upon his medical studies at the University of Edinburgh and Royal College of Surgeons. He obtained the diploma of the latter college in 1869, and graduated at the university with honors in 1871. He began practice in Durham, England, and for six years enjoyed a large patronage, when failing health compelled him to return to Canada. Here he wrote the history of his native county, which won for him the Aitken prize of Kings College. The epidemics of diphtheria, scarlet fever and typhoid, which were at that time almost decimating the Province, next claimed his attention, and in view of the fact that the government was doing next to nothing in the way of preventing these diseases, Dr. Macdonald, through the press and on the platform, brought the matter so forcibly before the public that reforms were soon inaugurated. In his investigations on this subject he traveled through every town and village of the province and embodied the result in a sanitary report to the government. It is mainly due to his efforts that in two years the mortality from diphtheria alone fell from 2,000 to 200 a year. In 1880 he was appointed Medical Officer to the Steel Company of Canada, at their works in Londonderry, N. S., a position which he held for six years. In 1887 he resigned his position and removed to Minneapolis, where he has devoted himself specially to surgery. He has filled the chairs of Principles and Practice of Surgery and of Clinical Surgery in the College of Physicians and Surgeons; is Consulting Surgeon to the Northwestern Hospital and vice-president of the Presbyterian Hospital. Among his contributions to medical literature are: "Experimental Research on the Nature and Treatment of Bronchial Hemorrhage" (Churchill & Sons, London); "A Successful Case of Para-

Samuel A. McWilliams.

cians and Surgeons, and of the Illinois State Medical Society.

MACDONALD, John William, of Minneapolis, Minn., was born in Nova Scotia, June 25, 1844. His early education was obtained at the Antigonish Grammar School and at St. Francis Xavier's College, at each of which he won several prizes. After graduation at the Normal

centesis of the Pericardium" (*British Medical Journal*, 1884); "The Surgical Treatment of Diseases of the Chest" (*Northwestern Lancet*, 1888); "The Nature and Treatment of Acute Suppuration" (Minneapolis Academy of Medicine, 1890).

MACNEVEN, William James, of New York City, was born at Ballynahowne, county of Galway, Ireland, March 21, 1763, and died July 12, 1841. His biographer, the late Dr. J. W. Francis, writes that his ancestors were respectable country gentlemen, residing on their own estate, which was transmitted in a direct line from father to son. They owned originally large possessions in the north of Ireland, but were deprived of them in the time of Cromwell, and, with many of their countrymen, were allotted lands in the wilds of Connaught. The subject of this memoir was sent for by his uncle, Baron Macneven, to receive his education in Germany, a custom very general in Catholic families, and rendered necessary at that time by the operation of penal laws. Young Macneven received an excellent classical education at the college at Prague; subsequently he passed through the medical college, and took the degree of Doctor in Physic at Vienna, in 1784. He seems to have been a favorite pupil of the learned Prof. Pestel. The same year he returned to Dublin, and entered upon the practice of his profession. With youth, health, superior abilities and education in his favor, and good family connections, he had a fair and prosperous career opened to him, and had Ireland been in a happier condition, or could selfish motives have deadened his love of his unfortunate country, eminence in his professional vocation must have been secured. His political associations, however, were of a character which he considered vital to the interests of his country; but, though much absorbed in matters of a public nature, he nevertheless continued the practice of his profession, and mingled in society as usual. The flattering prospect of renown in his medical vocation, and the pleasurable devotion to science, were destined to receive a check by the stormy career that was before him, and the future destinies of his life to be essentially modified by events of national influence on his country. It little becomes this work to dwell with minuteness on the scenes then about to transpire in revolutionary Ireland. To American readers, the career of the Emmets, Macneven and Sampson, both in their native land and in the country of their adoption, are already recorded in accessible pages, and in Dr. Macneven's narrative, entitled "Pieces of Irish History." His intimacy with that ardent youth, Lord Edward Fitzgerald, with Jones, O'Conner and other individuals of note; his entrance as a member of the secret society, in which he was joined by Thomas Addis Emmet; his arrest on the 12th of March, 1798; his confinement in Kilmainham, and subsequent removal to Fort George, are among the foremost occurrences most worthy of detail. The elasticity of his spirits abated not from his long imprisonment, and his love of knowledge gave him a support which lessened the privation and the annoyances of his imprisonment. In books he found society; they were his great resource. Among his studies, during his privation of liberty, we find he gave great attention to the

writings of Ossian, many of which he translated from the original Gaelic, a language with which he was perfectly familiar. It is said that his studies led him to the belief that Scotland was originally colonized by the Irish. It is also said that he contributed to General Vallancey's Gaelic Dictionary. After the arrival of the Emmet family at Fort George, he imparted to them instructions in the French language, and actually compiled for their use a French grammar. After the liberation of the state prisoners from Fort George, he passed the summer and autumn of 1802 in a pedestrian tour through Switzerland, and wrote an account of his journey, called "A Ramble through Switzerland." At the completion of this tour, he visited his relations in Germany, and ever after maintained a correspondence with them. The following year, 1803, he went to Paris, and at the latter part thereof he entered the French army, as a captain in the Irish Brigade. In justification of this movement, he was led to believe that the French intended the invasion of Ireland, and on enrolling himself in the service of France, he conceived he was only in another way devoting himself to his country, and to that cause which he had elsewhere espoused. He had sought an interview with Bonaparte, and had conferences with Talleyrand. Disappointed in these hopes, he at length resigned his commission. The reader, curious of further information concerning the active career of Dr. Macneven, with his co-patriot Emmet, will consult the volumes on the Rebellion of 1798, published by Dr. Madden. It may be here added that the vicissitudes of his political life made him, like Dr. Cooper, of Carlisle, personally well acquainted with a remarkable body of remarkable men, many of whom are immortalized on the pages of Junius. That he purchased his knowledge at no small expenditure of time and suffering, will readily be believed. New resolutions now animated his bosom. The cause of liberty in his own country had sustained a blow, the effects of which paralyzed further effort. A country where that great principle was the active spring in the transactions of a recent republic occupied his serious thoughts. He had at least one tried and long-devoted friend there, and thither he proposed to embark. He accordingly set sail from Bordeaux for New York, in June, 1804, and arrived in that metropolis on the afternoon of the 4th of July, in the midst of the rejoicings of the American nation in commemoration of the Declaration of Independence. He lost no time in making known his intentions of becoming an American citizen. He fixed upon New York as his permanent residence, and immediately entered upon the practice of physic. That venerable seat of classical learning, Columbia College, *causa honoris*, conferred on him the degree of Doctor of Medicine. He was strongly countenanced by his early and devoted friend Emmet, and upon the arrival of his co-patriot in Irish affairs, William Sampson, on the 4th of July, 1805, he found another generous supporter to illumine his endeavors. The confidence which this trio of talents and virtue reposed in each other was of the most unbounded kind, nor was that confidence ever interrupted through their long lives for a single day. His countrymen at large soon gathered around him, and Dr. Macneven had now proof sufficient to satisfy his

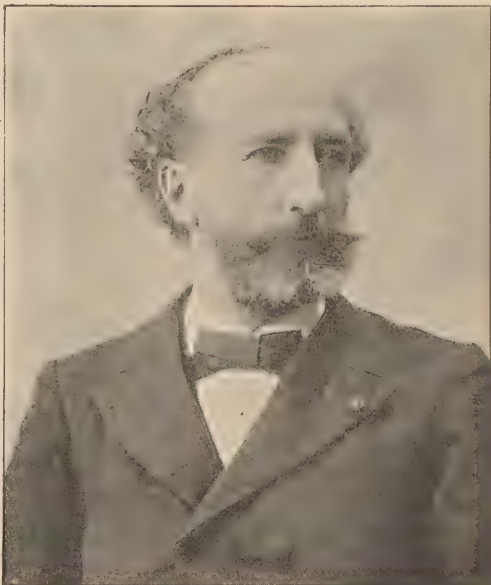

judgment that the chosen scene of his future life was the city of his adoption. In 1810 he was united in wedlock to Mrs. Jane Margaret Tom, an accomplished lady, the widow of a merchant, of New York, and daughter of Mr. Samuel Riker, of Newtown, Long Island, a descendant of the early Dutch settlers. By this marriage Dr. Macneven had a family of several sons and daughters, most of whom died of pulmonary consumption. His own constitution, however, was naturally of an excellent order, and secured to him the enjoyment of almost uninterrupted health until the last two years of his life when it failed rapidly. He died at the advanced age of seventy-eight years. He was a consistent and enlightened Roman Catholic, and his examination of other creeds tended only to confirm him in that persuasion. Extensive learning, rare attainments, great natural abilities, and long service in the cause of medical philosophy, entitle Dr. Macneven to a prominent place in biographical annals. He was alike distinguished in the political history of his own country and in the progress of science in the United States, the country of his adoption. The powers which had been granted to the honorable the regents of the University of the State of New York, after being long dormant, were called into active operation by the charter granted by that body for the establishment of the College of Physicians and Surgeons, in 1807, with the learned Nicholas Romaine, as president. Dr. Macneven delivered at their opening session a long course on clinical cases as they occurred in the New York Almshouse, of which institution, with the late Dr. Hosack, he was an associate physician. In 1808 he received from the regents the appointment of Professor of Midwifery. In 1810, a reorganization of the school took place, when Samuel Bard was placed at the head. Dr. Macneven was now chosen the Professor of Chemistry, and, in 1816, while Dr. Francis was in Europe, *Materia Medica* was added to his chair. This arrangement continued until 1820, when they were separated, Dr. Mitchell being assigned that duty, with Natural History. In 1826, he resigned his professorship in the College of Physicians and Surgeons, and, with his colleagues, who withdrew at the same time from the institution, he received the thanks of the board of regents for the faithful and able manner in which they had filled their respective offices as instructors and lecturers in said college. Few public documents on collegiate subjects could prove more gratifying to the feelings of an enlightened body of long-devoted teachers than the elaborate report on the college at this crisis, as drawn up by the regents, Marcy, Van Rensselaer and Talmage. In November following, he commenced an elaborate course of instruction on the *Materia Medica* in Rutgers Medical College, which institution, with a majority of his former associates, Drs. Hosack, Francis, Mott, and Drs. Griscom and Godman, was now organized in New York, at an expense of \$24,000, and opened at the usual period for the fall and winter courses. The success of this new school was demonstrative of the high opinion the public cherished for this well-known faculty, and it continued its operations with increased renown, and gave the strongest assurance of its beneficial services to medical and philosophical knowledge. After four years, however, its doors were

closed in consequence of legislative enactments, and Dr. Macneven, with his fellow-professors, ceased his labors as a public teacher. It will thus be perceived that, amid the vicissitudes which marked the history of the College of Physicians and Surgeons and the Rutgers Medical College, Dr. Macneven for more than twenty years was engaged as a professor of medical knowledge, and that for that long period he was most assiduous in contributing, with zeal and ability, to promote the soundest interests of a responsible and important science. He had left the State school, which he had helped to rear, in a condition of great prosperity, both in reputation and in the number of its pupils, and which, at the commencement of its career, had yet to secure the approbation and support of the profession. Its anomalous government, and the capricious measures of the trustees, were of themselves sufficient to distract the best councils and lead to results at war with that wise policy essential to great issues. In the ardent contentions which were maintained between the faculty and the trustees, Dr. Macneven's pen bore a powerful part in vindication of his colleagues, and several of his able compositions of sufficient pungency on the subject may be found in the third volume of his learned associate, Dr. Hosack's, *Essays*. The appeal to the regents of the University, and to the Legislature, on behalf of the incorporation of Manhattan Medical College, written by an actual student of the school, may be consulted by the curious reader solicitous of enriching his mind with medical politics. This manly effort for the creating of a new and independent medical and ehirurgical school was approved almost unanimously by the higher branch of the legislative councils of the State, and only failed through the lateness of the hour at which the act of incorporation was introduced to the consideration of the Assembly of New York. It was unquestionably a most benighted hour for the interest of knowledge when the authority of the regents was made subservient to the extinguishment of so laudable a design to advance Hippocratic wisdom. As a professor, Dr. Macneven was learned as an instructor, and ample in his exposition. His erudition gave him peculiar advantages. The stores of ancient and modern science were equally accessible to him, and he was ever ready to communicate. In chemical philosophy he was universally esteemed to hold a high rank. His studious disposition enabled him to penetrate the hidden wisdom of the astute and scholastic, and close attention to the progress of discovery, imparted new powers, with each returning term of the college, to improve his lectures and add new illustrations to experimental truths. It remains to notice briefly his literary labors. His "Rambles in Switzerland" have been already mentioned. His "Pieces of Irish History," and his numerous political tracts, which his eventful life was the cause of occasionally bringing forth, evince how deeply rooted in his bosom were the political vicissitudes of his country, and this sympathy with the land of his birth he cherished to the latest period of his existence. With Hugh Williamson and David Hosack, he was an active promoter of the organization of the Literary and Philosophical Society of New York, and contributed to the first volume of its Transactions a minute

analysis, with medical reflections on the remedial qualities of the mineral waters of Schooley's Mountain, N. J. He deemed them valuable in nephritic disorders and in calculous complaints. As his colleague, the erudite Mitchill, at the commencement of his experimental and collegiate career twenty years before, had in his instruction urged and defended the Lavoisierian system, so did Macneven press upon the attention, with the zeal of a proselyte, the atomic theory of Dalton, and his "Exposition of the Atomic Theory," which he printed in 1820, was received with favor, both abroad and at home, and reprinted in the *French Annals of Chemistry*. As co-editor of the *New York Medical and Philosophical Journal*, a work which, made up chiefly of selections, he projected, with Dr. Benjamin De Witt, in 1812, he wrote several papers on subjects strictly medical. He also published, in 1821, with emendations, an edition of Brande's *Chemistry*. His professional worth secured him several advantages. Governor De Witt Clinton appointed him Resident Physician of New York, an office which he held for several years, and in 1840 he received the same favor from Governor Seward. He was early a member of the Literary and Philosophical Society, and in 1823 he was elected a Fellow of the American Philosophical Society. When the Asiatic cholera made its first appearance in New York, in 1832, the municipal authorities selected him as one of its council. The official reports of the medical board during that awful crisis again and again affirmed it as their most mature conviction that the pestilence presented no evidence of a contagious or communicable character, the better to diminish the alarm created by the fearful visitor; yet notwithstanding these official annunciations Dr. Macneven and others of that sanitary guardianship believed the disorder to be a *nova pestis* in this country, and that its progress in the land was best explained by considering it a specific disease, and regulated by the law of *sub modo* contagion. That the life of Dr. Macneven was one closely devoted to knowledge and its promulgation is demonstrated by the following brief record of his principles and achievements: He was a prodigious reader, and his love of books was a prominent passion with him, and it is said that no medical man of the faculty with whom he was associated surpassed him in physiological pursuits and in the acquisition of languages. He was a classical scholar, and ready with citations from the most approved English writers. He spoke German and French with the same facility as the English, and in the Italian unlocked with delight the treasures of Dante and Ariosto. His native tongue, the Irish, as it was the first that he had learned, he conversed in through life with fluency. In his death all felt that learning had lost a distinguished ornament, real knowledge a true disciple, the charities of life an ardent friend, and patriotism one who had sustained martyrdom in her glorious cause.

MARCY, Henry Orlando, of Boston, Mass., son of Smith and Fanny (Gibbs) Marcy, was born in Otis, Mass., June 23, 1837. His ancestry was of Puritan stock—paternal (Marcy-Lawton); maternal, Gibbs-Morton—dating back to the early settlers of New England. His grandfather, Thomas Marcy, was one of the first settlers in northern Ohio. His ma-

ternal great grandfather, Israel, and grandfather, Elijah Gibbs, served in the Revolutionary War, and were with General Gates at the surrender of General Burgoyne. His father, who served in the war of 1812, was a teacher by profession. Dr. Marcy received his preliminary and classical education at Wilbraham Academy and Amherst College, and was graduated from the medical department of Harvard University, 1863. He was commissioned Assistant Surgeon of the Forty-Third Massachusetts Volunteers in April, 1863, and in the following November surgeon of the first regiment of colored troops recruited in North Carolina. He was appointed medical director of Florida in 1864, and served on the staffs of Generals Van Wyck, Potter and Hatch. In the autumn of 1863 Dr. Marcy was married to

Henry O. Marcy

Miss Sarah E. Wendell, of Great Falls, N. H. At the close of the war he returned to Cambridge, Mass., and entered upon the active practice of his profession. In the spring of 1869 he went to Europe for the purpose of study and entered the university at Berlin, where he remained a year as a special student of Professors Virchow and Martin. He then visited the various capitals of Europe and studied the hospitals and their service, spending the summer in London and Edinburgh. He was the first American pupil of Prof. Lister, and returned to put in practice the now famous, but then (in this country) unknown methods of aseptic and antiseptic surgery. For the purpose of devoting himself more especially to the study of surgical diseases, Dr. Marcy removed to Boston in 1880 and opened in Cambridge a private hospital for women, which is still in successful operation. Dr. Marcy has devised a considerable number of special operations now generally adopted by

the profession. He was largely instrumental in introducing plastic splints and did much to perfect them both in the materials used and the methods of preparation. He was the first to use and recommend the buried animal suture, and to him the profession is indebted for the introduction of the tendon suture, especially from the kangaroo, now widely accepted as superior to any other. Dr. Marcy is one of the most active and best known surgeons in New England. He participated actively in the Seventh International Medical Congress, held in London in 1881, and was president of the gynecological section of the Ninth Congress, held in Washington in 1887. He has contributed largely to surgical literature, and is an active worker in the American Medical Association, to the vice-presidency of which he was elected in 1879. In 1882 he was president of the section of obstetrics and gynecology, and was for some years a member of the judicial council of this association. In 1891 Dr. Marcy was chosen president of the association, over which body he presided at the annual meeting held in June, 1893, at Detroit. He is a member of various medical and scientific organizations in both Europe and America, and was president of the American Academy of Medicine in 1884. The Wesleyan University conferred in 1887 the honorary degree of LL. D. upon Dr. Marcy in recognition of his skill and literary merit. In 1884 Dr. Marcy published in two volumes the translation of the works of Prof G. B. Ercolani, of Bologna, Italy, upon the "Reproductive Processes," besides which he has published his own special studies of the uterine mucosa during pregnancy. During the last twenty years many important articles from his pen, on surgical subjects, have appeared in the *Boston Medical and Surgical Journal*, *Annals of Anatomy and Surgery*, *The Medical Gazette*, of New York, and other periodicals. Numerous papers read by him before the American Medical Association, American Association of Obstetricians and Gynecologists, and the International Medical Congress have been published in the Transactions of these organizations. His best known publications are: "Carbolised Cat-gut Sutures (buried in the tissue), for the Cure of Hernia," 1871; "Fracture of the Patella," 1876; "Plastic Splints in Surgery," 1877; "Cure of Hernia by the Antiseptic Use of the Animal Suture," 1878; "Aspiration of the Knee Joint," 1879; "The Comparative Value of Germicides," 1880; "Histological Studies of the Development of the Osseous Callous in Man and Animals," 1881; "Double Irrigation, Injection, and Drainage Tubes—Double Rubber Catheters," American Medical Association, 1881; "The Best Methods of Operative Wound Treatment," "Fibroid Tumors of the Uterus," their histology illustrated by many sections projected upon the screen; the annual address in obstetrics and diseases of women, St. Paul, June, 1882, American Medical Association; "The Relations of Micro-organisms to Sanitary Science," 1883; "The Restoration of the Perineum by a New Method," American Medical Association, 1883; "The Relation of Micro-organisms to Surgical Lesions," American Medical Association; "The Rôle of Bacteria in Infectious Diseases," 1884, American Medical Association; "Medical Legislation," "The Rôle of Bacteria in Parturition," "The Climatic Treatment of Disease,"

1885; "The Histology and Surgical Treatment of Uterine Myoma," "Address as President of the Section of Gynecology," International Medical Congress, Washington, 1887; "Placental Development in Woman," 1887; "The Climate of the Southern Appalachians," Ninth International Congress, 1887; "The Surgical Advantages of the Buried Animal Suture," "The Perineum; its Anatomy, Physiology and Methods of Restoration after Injury," 1888; "Chronic Inversion of the Uterus; Reduction by a New Method," "Exploratory Laparotomy," "General Treatise on Hernia," "The Animal Suture; its Place in Surgery," "The Cure of Hemorrhoids by Excision and Closure with the Buried Animal Suture," reprint from *Annals of Surgery*, November, 1889; "The Surgical Treatment of Non-pedunculated Abdominal Tumors," 1890; "Surgical Relief for Biliary Obstruction," 1890; "Plastic Surgery of the Pelvic Structures," Transactions International Medical Congress, Berlin, 1890; "The Scientific Rationale of Modern Wound Treatment," 1891; "Femoral and Ventral Hernia in Woman," "The Kangaroo Suture," Transactions American Association of Obstetricians and Gynecologists, 1891; "Evolution of Medicine," the president's address, American Medical Association, Detroit, June, 1892; "Inguinal Hernia in the Male," The Southern Surgical and Gynecological Association, Louisville, November, 1892; "The Reconstruction of the Pelvic Structures in Woman," Transactions American Association of Obstetricians and Gynecologists, 1892; "The Surgical Treatment of Hernia," the annual address delivered at the meeting of the South Carolina State Medical Society, April, 1893; "Ventral Hernia following Laparotomy; its Cause and Means of Prevention," "Analyses of One Hundred and Thirty-six Cases of Hernia, Operated on for the Purpose of Radical Cure," American Medical Association, June, 1893; "In what Class of Wounds Shall We Use Drainage?" Surgical Section Pan-American Congress, Washington, September, 1893; "The Anatomy and Surgical Treatment of Hernia," large quarto, fully illustrated, D. Appleton & Co., New York, 1892.

MARMION, William V., of Washington, D. C., was born at Harper's Ferry, Va., May 27, 1843. He received his academic course at that place, and his collegiate education at St. Mary's College, Emmitsburg, Md., where he was graduated in 1859. He pursued his professional studies at the University of Pennsylvania and at the University of Vienna. His medical degree was obtained at the former institution in 1866. He then entered the United States Navy as assistant surgeon, serving five years, and resigned as passed assistant surgeon in 1871. He established himself in Washington in 1872, where he has devoted special attention to ophthalmology. Dr. Marmion has been an active member of the Medical Association of the District of Columbia, and has been for many years an attending surgeon to the Children's Hospital, and has had charge of the eye and ear department of that institution.

MARSHALL, John S., of Chicago, Ill., was born in England, June 26, 1846. He served in the ranks of the Federal army, and with Sheridan's Cavalry Corps, from 1864 to the close of the Rebellion. He received his academic education at Fayetteville, N. Y., and

John S. Marshall

began the study of medicine under the preceptorship of William T. Plant, of Syracuse, and attended the Medical Department of Syracuse University, and was graduated M. D. from that institution in 1876. He immediately afterward established himself in the general practice of his profession at Syracuse, N. Y., and remained there six years, when he removed to Chicago, where he has since resided, and where he has devoted special attention to the treatment of the face, mouth and jaws. He is oral surgeon to Mercy Hospital, and St. Luke's Hospital, and Professor of Oral Surgery in the American College of Dental Surgery, Chicago. Dr. Marshall is a member of the American Medical Association, Illinois State Medical Society, Chicago Medical Society, and of the Practitioners' Club of that metropolis.

MARSHALL, William, of Milford, Del., was born in Milton, Sussex county, that State, May 23, 1827, and is of English parentage. He received his academic education at Milton, and his professional training at Jefferson Medical College, at which institution he was graduated in 1847. He began the practice of his profession in his native town, but soon after removed to Philadelphia and then went to California, being one of the Argonauts of 1849. He was surgeon of the expedition that went on the barque "Clarissa Perkins." On his arrival in the Golden State he settled in Placerville, staying there until 1852, when he returned to Milton, Del., but soon after established himself at Georgetown, in his native State, where he remained until the outbreak of the War of the Rebellion, in which he took part as surgeon of the Third Delaware Volunteers, participating in the battles of Harper's Ferry, Bolivar Heights, Charlestown, Cedar Creek, Winchester, the nine days' fight on

the Rappahannock, second Bull Run and Antietam. He was then discharged for disability, but afterward commanded a company in the Sixth Delaware Volunteers, and from June, 1863, acted as surgeon of that regiment during its term of service. During the war he also had charge of a hospital at Front Royal, Va. At the close of the war he resumed civil practice, finally settling in the town of his present residence in 1866. He has devoted special attention to surgery and obstetrics. While in the army he performed the successful operation for resection. He has been Secretary of his County Medical Society, and is ex-President of the Delaware State Medical Society; is a member of the American Medical Association, and of numerous other medical organizations. He is the author of a treatise "On Neuralgia," and one on "Eclampsia," and has made other important contributions to medical literature.

MARYOTT, Erastus Edgar, of Springfield, Mass., was born in North Stonington, Conn., September 29, 1845. He is the third son of Ichabod B. and Almira (Miner) Maryott. His father was a Baptist clergyman, whose great-grandfather, though coming to this country from England, was probably a French Huguenot. He received his elementary education at the village school, and was fitted for college at the Connecticut Literary Institute, at Suffield. In 1866 he entered Brown University and graduated in 1870, receiving the degree of A. M. three years later. He studied theology at Crozer Seminary, Chester, Pa., and was engaged in literary pursuits until he graduated in medicine at the Albany Medical

E. E. Maryott.

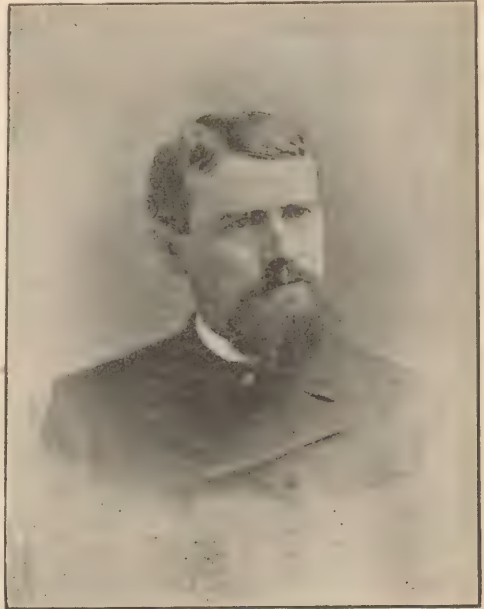

College, in 1882. His medical preceptors were the late Dr. George A. Pierce and Dr. Albert Vanderveer, of Albany, N. Y. His medical career has been mostly spent in Springfield, Mass., in the constant activity of study, prac-

tice and authorship. He has written many articles on medical subjects, most of which have been reserved for a work in preparation for the press, "A Modern System of Medicine for the People." This will be a volume of about a thousand pages, covering a wide range of medical and sanitary subjects. His special qualifications are in the lines of materia medica and obstetrics, and he has the remarkable record of never having lost a patient after confinement. Dr. Maryott is a Fellow of the Massachusetts Medical Society, the American Academy of Medicine, and was recently elected to membership in the American Academy of Political and Social Science. He is prominent in Masonic circles and belongs to Springfield Commandery of Knight Templars.

MASTIN, Claudius Henry, of Mobile, Ala., was born June 4, 1826, at Huntsville, Ala. His academic education was at Green Academy, Huntsville, Ala.; collegiate education at University of Virginia. In 1846 he began the study of medicine; Dr. Geo. B. Wood, of Philadelphia, was his private preceptor. He took the degree of M. D. from the University of Pennsylvania, in 1849, and the degree of Doctor of Laws (LL. D.) from the same university, in 1875. He also studied his profession at the University of France, hospitals of Paris, and afterwards at the Royal College of Surgeons, London, then at the University of Edinburgh, Scotland, and settled in Mobile, Ala., in 1854. He was for five years surgeon of City Hospital, also surgeon in charge of United States Marine Hospital, and subsequently three years surgeon of Providence Infirmary. He served in the Confederate States army, as medical director upon the staff of Major-General Leonidas Polk, of the First Grand Division of the Western Department; subsequently as corps surgeon of General Polk's Corps of the Army of the Tennessee, with other army service. He has invented several surgical instruments. The University of Pennsylvania gave him the degree of LL. D., 1875. He was one of the original Fellows of the American Surgical Association, afterwards its second vice-president, then first vice-president, and in 1890-91 its president; then elected a member of its council. He was one of the organizers of the American Genito-Urinary Association, a member of the Boston Gynecological Society, a member of the Southern Surgical and Gynecological Association, an honorary member of the Texas Historical Association, a member of the Central Council of the University of Pennsylvania, and one of its examining board. He is one of the trustees of the Pan-American Medical Congress, and honorary chairman of its Surgical Section. He has contributed largely to medical and surgical literature. He devotes his time chiefly to surgery, both general and special, and has operated extensively, doing many of the most important operations. He is the founder of the Congress of American Physicians and Surgeons. In 1885 he presented a memoir to the American Medical Association, then in session in Washington, D. C., which resulted in uniting the various special American medical associations into a common body, under the name and title of the Congress of American Physicians and Surgeons, which organization was completed October 5, 1887; and he is a member of other medical organizations.

MATHEWS, Joseph McDowell, of Louis-

ville, Ky., was born at New Castle, Ky., in 1847. The subject of this sketch is one of the best known and most popular surgeons in the United States. He enjoyed a fine classical education, the fruits of which are seen in his writings and public speeches. He graduated in medicine in 1867, and entered at once upon a country practice in his native town. He removed to Louisville, Ky., in 1872, and did a large general practice until 1878, when he went to London, England, and became associated with the celebrated Allingham, of St. Mark's Hospital. Upon his return to Louisville, Dr. Mathews entered upon the special practice of rectal diseases, and is to-day regarded as among the best authorities upon this class of affections. He was the pioneer specialist in rectal diseases in this country. Dr.

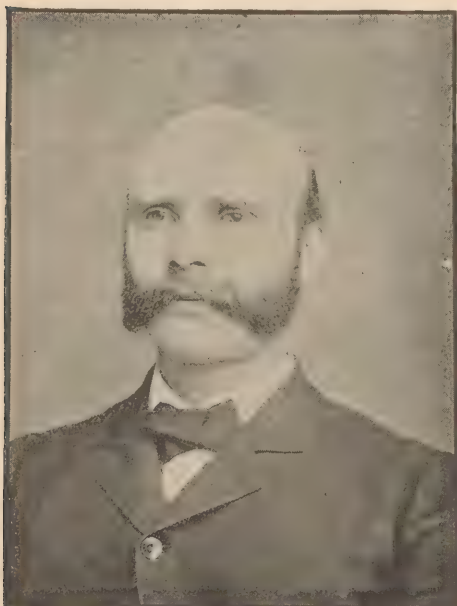

Joseph M. Mathews.

Mathews was formerly Lecturer on Diseases of the Rectum in the Hospital College of Medicine in Louisville. He has, however, for a number of years been Professor of Surgery and Diseases of the Rectum in the Kentucky School of Medicine. Dr. Mathews occupies many important public positions. He is Surgeon to the Louisville City Hospital and the Sts. Mary and Elizabeth Hospital, and ex-president of the Mississippi Valley Medical Association and of the Louisville Clinical Society. Dr. Mathews was a very close second in the race for the presidency of the American Medical Association two years ago. He was selected to deliver the address on surgery at the meeting in Washington in 1891. That Dr. Mathews is editorially prominent, the pages of *Medical Progress* bear witness. Dr. Mathews is probably the finest speaker in the American medical profession; always at his ease, with perfect command of language and never at a loss for a subject or phrases wherewith to clothe it, he is at all times a representative of whom the

medical profession may well be proud. To be considered a great orator in Kentucky, the home of orators, is indeed a distinction in which Dr. Mathews may take pride, and nowhere is he done more honor than upon his native soil. As an author, Dr. Mathews ranks with the leading authorities, either in this country or in Europe. His book on "Diseases of the Rectum, Anus and Sigmoid Flexure," just issued by the Appletons, is said by competent critics to be a work of great originality and rare merit, and is meeting with a large sale.

MAXWELL, Allison, of Indianapolis, Ind., was born at Bloomington, Ind., September 24, 1848, his parents being Dr. James Darwin Maxwell and Louisa Howe Maxwell. As Dr. Max-

Allison Maxwell

well's entire name is Scotch, it is not to be inferred that his immediate ancestors came from Scotland. His father was born at Hanover, Ind., in 1815; his grandfather, Dr. David H. Maxwell, was born near Danville, Ky., and studied medicine under the immortal Dr. Ephraim McDowell; his great grandfather was a Virginian, by name Bazeleel Maxwell, and his father immigrated from Scotland to the north of Ireland and thence to Virginia. The subject of our sketch was reared in his native town, and graduated at Indiana University in 1868. After graduation he was appointed tutor in Latin and Greek in the university, which position he resigned to accept a place in the large book and publishing house of A. L. Bancroft & Co., San Francisco, Cal., where he remained two years as the manager of the educational department. On leaving San Francisco he came home and studied medicine with his father. After a three years' graded course at Miami Medical College, by a competitive examination, he became *interne* in the Cincin-

nati Hospital. At the expiration of his hospital service, one year, he came to Indianapolis and associated himself with Dr. Theophilus Parvin as his assistant, with whom he remained until Dr. Parvin accepted a professorship in the Jefferson Medical College, and removed to Philadelphia eight years afterward. Dr. Maxwell served as coroner of Marion county four years, being elected in 1879 and re-elected in 1881. He was elected Professor of the Theory and Practice of Medicine in the Central College of Physicians and Surgeons in 1887, which position he now holds. He is also one of the clinical lecturers at the City Hospital on the practice of medicine, having been a member of the hospital staff for four years. He is also a member of the City Dispensary Staff. Two years ago Dr. Maxwell was appointed by the mayor of Indianapolis, the republican member of the board of health commissioners under the new city charter, which position he now holds. He has been secretary and president of his county Medical Society. His contributions to medical literature have been comparatively few, relating more especially to diseases of the chest.
